Energy Research Abstracts

Abstracts 32441-35012

Technical Information Center
Office of Scientific & Technical Information
UNITED STATES DEPARTMENT OF ENERGY

CURRENT AWARENESS PUBLICATIONS ON ENERGY

To provide complete coverage of literature related to major Department programs, announcement publications that are comprehensive in their coverage of certain energy fields are issued regularly. All information in these publications, plus additional backup information, is included in the Energy Data Base of the Technical Information Center; all references are also available for machine searching via the on-line retrieval system, DOE/RECON, and the commercial on-line retrieval systems. Descriptions of these current awareness publications, which are supported either directly or indirectly by the DOE, appear below. Department of Energy components may receive the listed publications free from the Technical Information Center, Office of Scientific and Technical Information, P. O. Box 62, Oak Ridge, TN 37831. Telephone (615) 576-1301; FTS 626-1301.

PUBLICATIONS OF THE TECHNICAL INFORMATION CENTER

Energy Abstracts for Policy Analysis (EAPA)

A monthly abstract journal devoted to the analysis of energy research, conservation, and policy. Scope and coverage are limited to substantive articles or reports and emphasize the following programmatic efforts; legislative, regulatory, and other legal aspects; social, economic, and environmental impacts; regional and sectoral analyses; institutional factors, etc. *EAPA* is available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402; domestic subscribers $5.00, foreign $6.25 per copy; annual cumulative index, domestic $16.00, foreign $20.00 per copy. The annual subscription price is $72.00 for domestic subscribers and $90.00 for foreign subscribers.

Energy Research Abstracts (ERA)

A comprehensive semimonthly abstract journal devoted to all areas of energy-related information produced by the Department of Energy, other U. S. government organizations, and foreign governments. *ERA* is available to the public on a subscription basis from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The subscription rate for the 24 semimonthly issues is $165.00 for domestic subscribers and $206.25 for foreign subscribers. A single issue costs $9.50 (domestic) or $11.90 (foreign).

DOE Patents Available for Licensing (PAL)

DOE is prepared to grant exclusive or nonexclusive, revocable licenses under DOE-owned U. S. patents and patent applications; this semiannual publication provides abstracting and indexing coverage of this literature. *PAL* is available on subscription as PB84-946800 from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. The annual subscription price is $14.00 for domestic subscribers and $28.00 for subscribers outside the North American continent; prices for single issues are $7.00 and $14.00, respectively.

The following monthly update journals are available to the public on subscription from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161; use the identifying order number (PB- No.) when subscribing. The annual subscription rate for one volume (calendar) year (12 issues plus cumulative index) is $75.00 for domestic (North America) and $150.00 for foreign (outside North America) subscribers. A single issue is $7.00 (domestic) and $14.00 (foreign).

***Current Energy Patents (CEP)*–PB84-902800**

Provides coverage of the international patent literature, including patent applications, that concerns any aspect of energy production, conservation, and utilization.

***Energy and the Environment (EAE)*–PB84-914900**

Devoted to information on the impacts of energy-related activities and radioactive and nonradioactive pollutants on the environment.

***Fossil Energy Update (FEU)*–PB84-914600**

Devoted to information on the exploration, development, processing, and use of fossil fuels.

***Fusion Energy Update (CFU)*–PB84-915300**

Devoted to information on controlled thermonuclear fusion, including plasma and fuel research and power plant engineering and conceptual design studies.

***Solar Energy Update (SEU)*–PB84-914500**

Devoted to information on the utilization of solar energy, including biomass and tidal and wind power.

The following semimonthly bulletins are also available from the National Technical Information Service. The annual subscription rate for one volume (calendar) year (24 issues; no indexes) is $40.00 for domestic subscribers and $80.00 for subscribers outside the North American continent; use the identifying order number (PB- No.) when subscribing.

***Acid Precipitation (APC)*–PB84-901000**

Covers all aspects of acid precipitation, including effects and possible control measures.

***Coal-Based Synfuels (CBS)*–PB84-901400**

Covers all aspects of conversion of coal into gaseous or liquid fuels.

***Coal Preparation and Pollution Control (CPC)*–PB84-900800**

Covers all aspects of coal preparation and cleaning and reducing pollution from its direct combustion.

***Direct Energy Conversion (DEC)*–PB84-946600**

Covers the following areas: photovoltaics, magnetohydrodynamics, electrohydrodynamics, thermoelectrics, thermionics, and fuel cells.

***Geothermal Energy Technology (GET)*–PB84-914700**

Devoted to information on the exploration, development, and utilization of geothermal resources.

***Laser Research (LAR)*–PB84-901100**

Covers all aspects of laser research and development, but excludes applications.

***Nuclear Fuel Cycle (NFC)*–PB84-913400**

Covers all aspects of the nuclear fuel cycle, both front end and back end.

***Nuclear Reactor Safety (NRS)*–PB84-913500**

Covers the following safety aspects: accident analysis, safety systems, radiation protection, decommissioning and dismantling, and security measures.

***Radioactive Waste Management (RWM)*–PB84-902900**

Covers the following management aspects: transport and storage, waste processing, waste disposal, waste storage, radioactive effluents, and shipping containers.

***Solar Thermal Energy Technology (STT)*–PB84-901200**

Covers research in materials, concentrators/receivers, salinity gradients, etc., for development of efficient and reliable solar thermal conversion systems.

***Unconventional Petroleum (UCP)*–PB84-901300**

Covers all aspects of secondary and tertiary recovery of petroleum and of oil shales and tar sands.

INTERNATIONAL ENERGY PUBLICATIONS

The Office of Scientific and Technical Information, Technical Information Center (TIC) cooperates with the following organizations in the publication of international abstract journals: (1) International Atomic Energy Agency, International Nuclear Information System, Vienna, Austria, for *Atomindex;* (2) International Energy Agency, IEA Coal Research, London, England, for *Coal Abstracts;* and (3) International Energy Agency, Biomass Conversion Technical Information Service, Dublin, Ireland, for *Biomass Abstracts.* In each case, the cognizant foreign agency provides the non-U.S. information to TIC for inclusion in the Energy Data Base; in turn, TIC provides the U. S. information for input into the respective journal.

Atomindex

A semimonthly abstract journal providing worldwide coverage of information on nuclear science and technology. *Atomindex* is available by subscription from UNIPUB, 345 Park Avenue South, New York, NY 10010. The cost of an annual subscription, 24 semimonthly issues and semiannual and annual cumulative indexes, is $290.

Biomass Abstracts

A bimonthly abstract journal with comprehensive coverage of information in any step involved in the eventual conversion of biomass to energy. *Biomass Abstracts* is available free to Department of Energy components and contractors from the Technical Information Center. Non-DOE organizations may obtain *Biomass Abstracts* from Biomass Conversion Technical Information Service, Institute for Industrial Research and Standards, Ballymun Road, Dublin 9, Ireland, for 42 IR pounds per year. Make checks payable to the Institute.

Coal Abstracts

A monthly abstract journal providing comprehensive worldwide coverage of information in the field of coal science and technology. *Coal Abstracts* is available to Department of Energy components and contractors from the Technical Information Center. Non-DOE organizations may obtain *Coal Abstracts* from IEA Coal Research, Technical Information Service, 14-15 Lower Grosvenor Place, London SW1W 0EX, England, for 100 pounds sterling per year.

ENERGY RESEARCH ABSTRACTS

ABOUT THE TECHNICAL INFORMATION CENTER

The Office of Scientific and Technical Information, Technical Information Center in Oak Ridge, Tennessee, has been the national center for scientific and technical information for the Department of Energy (DOE) and its predecessor agencies since 1946. In developing and managing DOE's technical information program, the Center places under bibliographic control not only DOE-originated information but also worldwide literature on scientific and technical advances in the energy field and announces the source and availability of this information. Whereas the literature of science is emphasized, coverage is extended to DOE programmatic, socioeconomic, environmental, legislative/regulatory, energy analysis, and policy-related areas. To accomplish this mission, the Center builds and maintains computerized energy-information data bases and disseminates this information via computerized retrieval systems and announcement publications such as abstracting journals, bibliographies, and update journals. Direct access to the Center's most comprehensive data base, the Energy Data Base, is available to the public through commercial on-line bibliographic retrieval systems. The Energy Data Base and many of the Center's energy-related data bases are available to DOE offices and contractors and to other government agencies via DOE/RECON, the Department's on-line information retrieval system. The Center has developed and maintains systems to record and communicate energy-related research-in-progress information, to maintain a register of DOE public communications publications, to track research report deliverables from DOE contractors, and to test and make available DOE-funded computer software programs with scientific and management applications. The Center also maintains a full-scale publishing capability to serve special publication needs of the Department. To effectively manage DOE's technical information resources, the Center's program is one of continual development and evaluation of new information products, systems, and technologies.

ABOUT *ENERGY RESEARCH ABSTRACTS*

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports, journal articles, conference papers and proceedings, books, patents, theses, and monographs originated by the U. S. Department of Energy, its laboratories, energy centers and contractors. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations. The user should remain aware that *ERA* coverage of non-report literature is limited to that generated by Department of Energy activity.

ERA is comprehensive in its subject scope, encompassing the DOE's research, development, demonstration, and technological programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

ERA is available on an exchange basis to universities, research institutions, industrial firms, and publishers of scientific information. Inquiries should be directed to the Office of Scientific and Technical Information, Technical Information Center, P. O. Box 62, Oak Ridge, TN 37831.

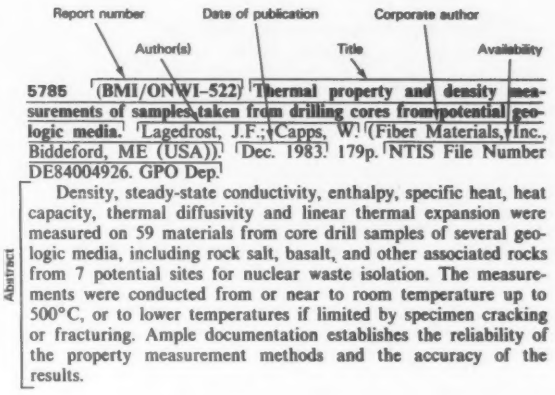
ERA is available to the public on a subscription basis from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The subscription rate for the 24 semimonthly issues is $165.00 for domestic subscribers and $206.25 for foreign subscribers. A single issue costs $9.50 (domestic) or $11.90 (foreign). The cumulative indexes will be available in printed form from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, and in microfiche form from the National Technical Information Service, U. S. Department of Commerce, Springfield, VA 22161, and from Engineered Systems, P. O. Box 866, Oak Ridge, TN 37831.

Technical Information Center, Office of Scientific and Technical Information
United States Department of Energy, P. O. Box 62, Oak Ridge, TN 37831

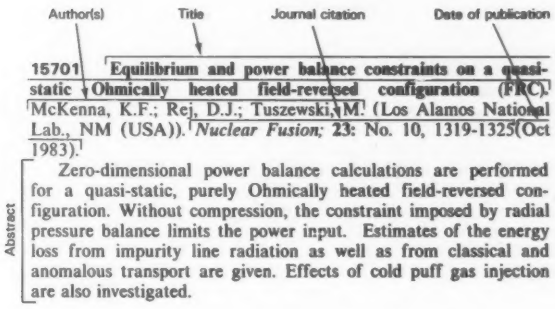
HOW TO USE *ENERGY RESEARCH ABSTRACTS*

ABSTRACTS IN *ENERGY RESEARCH ABSTRACTS*

The principal elements of abstract entries for a typical research and development report and a typical technical journal article are illustrated below.



Report number
Date of publication
Corporate author
Author(s)
Title
Availability
5785 (BMI/ONWI-522) Thermal property and density measurements of samples taken from drilling cores from potential geologic media. Lagedrost, J.F.; Capps, W. (Fiber Materials, Inc., Biddeford, ME (USA)). Dec. 1983. 179p. NTIS File Number DE84004926. GPO Dep.
Abstract
Density, steady-state conductivity, enthalpy, specific heat, heat capacity, thermal diffusivity and linear thermal expansion were measured on 59 materials from core drill samples of several geologic media, including rock salt, basalt, and other associated rocks from 7 potential sites for nuclear waste isolation. The measurements were conducted from or near to room temperature up to 500°C, or to lower temperatures if limited by specimen cracking or fracturing. Ample documentation establishes the reliability of the property measurement methods and the accuracy of the results.



Author(s)
Title
Journal citation
Date of publication
15701 Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC). McKenna, K.F.; Rej, D.J.; Tuszewski, M. (Los Alamos National Lab., NM (USA)). Nuclear Fusion; 23: No. 10, 1319-1325 (Oct 1983).
Abstract
Zero-dimensional power balance calculations are performed for a quasi-static, purely Ohmically heated field-reversed configuration. Without compression, the constraint imposed by radial pressure balance limits the power input. Estimates of the energy loss from impurity line radiation as well as from classical and anomalous transport are given. Effects of cold puff gas injection are also investigated.

INDEXES TO *ENERGY RESEARCH ABSTRACTS*

Five indexes are provided for approaching the contents of each issue of *Energy Research Abstracts (ERA)*. Each index is preceded by an introduction that details the organization of the index and the principles by which it was compiled. The reader is referred to these introductions for information not found in the index examples that follow.

• Corporate Author Index

Technical report literature is indexed using the name of the organization or institution responsible for the issuance of the report.

5785 (BMI/ONWI-522) **Thermal property and density measurements of samples taken from drilling cores from potential geologic media.** Lagedrost, J.F.; Capps, W. **(Fiber Materials, Inc., Biddeford, ME (USA)).** Dec. 1983. 179p. NTIS File Number DE84004926. GPO Dep.

is indexed as:

Fiber Materials, Inc., Biddeford, ME (USA)

• Personal Author Index

Each author's name is indexed in the form appearing on the document abstracted, with the exception that given names are reduced to initials:

Capps, W., *See* Lagedrost, J. F.
Lagedrost, J.F., Thermal property and density measurements of samples taken from drilling cores from potential geologic media, 9:5785 (R:US)
McKenna, K.F., Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC), 9:15701 (J:US)
Rej, D.J., *See* McKenna, K.F.
Tuszewski, M., *See* McKenna, K.F.

• Subject Index

The subject index consisting of entries naming specific materials, objects, and processes is arranged alphabetically. Document titles, informative phrases, or both specific to these entries are arranged alphabetically under the entries.

SALT DEPOSITS
Density
Thermal property and density measurements of samples taken from drilling cores from potential geologic media, 9:5785 (R;US)
REVERSED-FIELD PINCH
Energy Balance
Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC), 9:15701 (J;AT)

• Contract Number Index

DOE technical report literature is indexed using contract numbers. This index contains the contract number with corresponding abstract and report numbers.

AC06-76RL01830 **Fiber Materials, Inc., Biddeford, ME (USA)** 9:5785 BMI/ONWI-522

• Report Number Index

Technical report literature is also indexed using report numbers. This index includes information on where individual reports may be obtained. Patents and conference papers are indexed here as a matter of convenience. When a report is supplied under a File Number, that number is included in the availability statement. A File Number–Report Number Correlation is included for convenience.

BMI/ONWI-522 9:5785 **NTIS, PC A09/MF A01. File Number DE84004926, Distribution Category MN-70**

Communication concerning the editorial policy and content of *Energy Research Abstracts* should be addressed to the Editor, *Energy Research Abstracts,* Office of Scientific and Technical Information, Technical Information Center, P. O. Box 62, Oak Ridge, TN 37831.

SUBJECT CONTENTS (NUMERICAL LISTING)

Six-digit subject category numbers are used in the storage, retrieval, and manipulation of bibliographic information entered into DOE's computerized bibliographic information system. The six-digit category numbers are utilized as if they were three pairs of two-digit numbers, the first two pairs being used to arrange the abstract content of *Energy Research Abstracts*. The following listing includes the totality of the 40 first-level and 293 second-level subject categories used. Because each issue of *ERA* announces only those documents becoming available during a semimonthly period, some subject categories may not be represented in every issue. The complete subject category scheme with scope definitions and limitations is available as DOE/TIC-4584-R5 from NTIS for $9.50.

32441 (CAPE—2938) H-Coal Pilot Plant. Final report. Volume X, 13.0 P and IDs (Microfilm) (Engineering Materials). 20 Feb 1984. Contract AC05-76ET10143. TIC, PO Bx 62, Oak Ridge, TN 37831. Order Number TI84012305.

85 35-mm aperture cards.

Volume X of the H-Coal Pilot Plant Final Report is devoted entirely to Piping and Instrument Diagrams and is comprised of the following section: 13.0 P and IDs (Microfilm). This section contains all of the nonproprietary Pilot Plant Piping and Instrument Diagrams. These are presented in microfilm form on 35-mm aperture cards for easy reference. Table 13-1 provides an index of the P and IDs, separated by Plant areas, as follows: 100 Area - Coal Handling and Preparation; 200 Area - Coal Hydrogenation; 400 Area - Off-Site (Utilities); and 600 Area - Waste Oil Recovery. Additional Final Report reference material, such as an overall detailed index, a bibliography of H-Coal related reports and an equipment list, is presented in Volume I, Section 2.0.

32442 (CONF-8311150—Summs.) Proceedings of the fifth meeting on basic heterogeneous catalysis surface science research. (USDOE Office of Energy Research, Washington, DC. Office of Basic Energy Sciences). Mar 1984. 104p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013676.

From 5. DOE/BES meeting on basic heterogeneous catalysis surface science research; Gaithersburg, MD, USA (7 Nov 1983).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This document consists primarily of 46 project summaries, giving research scope and objectives, description of research effort, and future research. Topics include CO hydrogenation, zeolites, coal liquefaction, methane oxidation, methanol synthesis and conversion, carbon gasification, etc.

32443 (CSIRO-DFF-IR—140) CSIRO flash pyrolysis project: compendium of data. Edwards, J.H.; Smith, I.W.; Tyler, R.J. (Commonwealth Scientific and Industrial Research Organization, North Ryde (Australia). Div. of Fossil Fuel). 1983. 35p. Commonwealth Scientific and Industrial Research Organization, Div. of Fossil Fuel, North Ryde, Australia.

A description is given of the CSIRO experiment for the production of liquid fuels by the flash pyrolysis of coal. The reaction system involved pyrolysers, tar hydrogenators and char combustors, both at the laboratory and process development unit scale. Data are given on the properties and pyrolysis behaviour of all coals pyrolysed, and on the yield and properties of the solid, liquid and gaseous products of pyrolysis. Results are reported, or indicated, from support studies for: the combustion and gasification reactivities of char, the kinetics of coal pyrolysis, the secondary pyrolysis of chars, and the nature of cracking and coking control of tars.

32444 (DOE/ET/10137—T8) Gasification of residual materials from coal liquefaction. Type III extended pilot plant evaluation of a pelletized and ground Kerr McGee mineral ash residue from SRC-I coal liquefaction process. Wu, C.M.; Robin, A.M. (Texaco, Inc., Montebello, CA (USA). Montebello Research Lab.). Feb 1984. Contract AC01-76ET10137. 66p. (FE—2247-35). NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013199.

A Type III extended pilot plant evaluation of pelletized and ground Kerr McGee mineral ash residue, which was obtained from the liquefaction of Illinois No. 6 coal at the SRC-I coal liquefaction process pilot plant at Wilsonville, Alabama, was successfully completed at Texaco's Montebello Research Laboratory (MRL). A total of 60 tons of residue was gasified during three runs which were carried out at 950 psig in the MRL High Pressure Solids Gasification Unit II gasifier. The oxygen-to-residue ratio was varied to determine optimum operating conditions. The runs lasted from 6.9 hours to 56.3 hours and a total of 72.9 hours of on-stream time was accumulated. This work was authorized by DOE Delivery Order Number 9 under DOE contract DEAC-01-76ET-10137. It is part of a continuing project to evaluate residual materials from various DOE sponsored coal liquefaction projects to determine their suitability for conversion to hydrogen using one of the Texaco gasification processes. 5 figures, 5 tables.

32445 (DOE/ET/10137—T10) Gasification of residual materials from coal liquefaction: Type II preliminary pilot plant evaluation of SRC-I extruded Kerr McGee mineral ash residue-water slurry. Wu, C.M.; Robin, A.M. (Texaco, Inc., Montebello, CA (USA). Montebello Research Lab.). May 1984. Contract AC01-76ET10137. 30p. (FE—2247-34). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013525.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A Type II preliminary pilot plant evaluation of SRC-I Kerr McGee mineral ash residue as a water slurry feed to the Texaco Coal Gasification Process was conducted at Texaco's Montebello Research Laboratory (MRL). The residue was obtained in the extrudate form directly from the Critical Solvent Deashing process at Wilsonville, Alabama. Approximately 16 tons of residue were gasified during three test runs which were carried out at 950 psig in MRL's High Pressure Solids Gasification Unit I. The runs lasted from 4.8 hours to 7.2 hours, and a total of 19.1 hours of on-stream time was accumulated. This work was authorized by DOE Delivery Order Number 10 under DOE contract EX-76-C-01-2247 and amendment DEAC-01-76ET-10137. It is part of a continuing effort to evaluate residual materials from various DOE sponsored coal liquefaction projects to determine their suitability for conversion to hydrogen using one of the Texaco gasification processes.

32446 (DOE/ET/10328—1628) Advancement of flash hydrogasification. Quarterly technical progress report, January-March 1984. Falk, A.Y. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 25 Jun 1984. Contract AC21-78ET10328. 91p. (ESG-DOE—13432). NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013151.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This first quarterly report documents technical progress during the period 31 December 1983 through 30 March 1984. The technical effort is 17 months in duration and is divided into two major technical tasks: Task VII, Hardware Fabrication and PDU Modifications, and Task VIII, Performance Testing. The design of test hardware and process development unit modifications had been

previously completed as part of Task VI of the current contract. Task VII involves the fabrication of test hardware and modification of an existing 1-ton/h hydroliquefaction PDU at Rockwell's facilities for use as a hydrogasifier test facility. During this report period, fabrication of the test hardware and modifications to the PDU were initiated. Test hardware fabrication is now approximately 80% complete and should be completed by the end of May 1984. PDU modifications are progressing well and should be completed by the end of June 1984. The completed test hardware fabrication and PDU modifications will allow the conduct of short duration (1 to 2 h) hydrogasification tests along with preburner assembly performance evaluation tests in order to fulfill the test program objectives. Separate supplies of hydrogen, oxygen, methane, carbon monoxide, and water (for steam generation) are provided for this purpose. The modified facility is designed to accommodate both 10- and 20-ft-long hydrogasifier reactors so that residence times will be in the range of 2 to 6 s when coal is fed at a nominal 1/2 ton/h into reactors at 1000 psia pressure. Provisions are being made for real-time analysis of the product gases using an on-line gas chromatograph system. Test planning was the only Task VIII effort active during this report period. An initial (preliminary) test matrix has been defined. Preparation of a data analysis plan is underway, and data reduction programs are being programmed. 17 references, 25 figures, 6 tables.

32447 **(DOE/ET/10633—T1) Electrochemical disposal of hydrogen sulfide. Final report, August 31, 1977-September 30, 1982.** Angus, J.C.; Landau, U.; Feke, D.L.; Gregory, T.D.; Kehr, P.M. (Case Western Reserve Univ., Cleveland, OH (USA). Dept. of Chemical Engineering). 20 Sep 1982. Contract FG01-77ET10633. 102p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013670.

Portions are illegible in microfiche products.

The electrolysis of hydrogen sulfide to elemental hydrogen and sulfur was investigated as a means for hydrogen sulfide disposal. Both the electrolysis of liquid hydrogen sulfide and the electrolysis of aqueous hydrogen sulfide solutions were investigated. The first reported electrolysis of liquid hydrogen sulfide was accomplished. However, the overpotential arising from ohmic losses in the hydrogen sulfide are extremely high. Unless better supporting electrolytes can be found, this method does not appear to be a practical means for hydrogen sulfide disposal. The electrochemical oxidation of aqueous hydrogen sulfide solutions was investigated and found to be a more promising approach. It was found that a sulfur film did not form on the anode in either a cell using a continuous flow of electrolyte or in a cell employing a fluidized bed anode. In both types of electrolysis the products were found to be elemental hydrogen and elemental sulfur. This is a desirable result because these products have significant economic value and, furthermore, sulfur is very easily stored. Further work should be directed towards finding much better electrolytes for use with liquid hydrogen sulfide and towards an experimental and economic study of the use of fluidized bed anodes for the electrolysis of aqueous hydrogen sulfide solutions. 10 references, 21 figures.

32448 **(DOE/ET/13046—T83) Industrial fuel gas plant project. Phase II. Memphis industrial fuel gas plant. Final report.** (Memphis Light, Gas and Water Div., TN (USA)). 1983. Contract AC02-77ET13046. 106p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84011682.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The Industrial Fuel Gas Plant produces a nominal 50 billion Btu/day of product gas. The entire IFG production will be sold to MLGW. Under normal conditions, 20% of the output of the plant will be sold by MLGW to the local MAPCO refinery and exchanged for pipeline quality refinery gas. The MAPCO refinery gas will be inserted into the Memphis Natural Gas Distribution System. A portion (normally 10%) of the IFG output of the plant will be diverted to a Credit Generation Unit, owned by MLGW, where the IFG will be upgraded to pipeline quality (950 Btu/SCF). This gas will be inserted into MLGW's Natural Gas Distribution System. The remaining output of the IFG plant (gas with a gross heating value of 300 Btu/SCF) will be sold by MLGW as Industrial Fuel Gas. During periods when the IFG plant is partially or totally off-stream, natural gas from the Memphis Natural Gas Distribution System will be sent to an air mixing unit where the gas will be diluted to a medium Btu content and distributed to the IFG customers. Drawing 2200-1-50-00104 is the plant block flow diagram showing the process sequence and process related support facilities of this industrial plant. Each process unit as well as each process-related support facility is described briefly.

32449 **(DOE/FE/60181—58) Effects of start-up solvent on composition of recycle liquefaction product slurry from low-rank coal.** Timpe, R.C.; Farnum, S.A.; Miller, D.J.; Wolfson, A.C.; Rindt, J.R.; Potts, Y.R. (North Dakota Univ., Grand Forks (USA). Energy Research Center). 1984. Contract FC21-83FE60181. 18p. (CONF-840805—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84009231.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

As part of the on-going research in the liquefaction of low-rank coal, the University of North Dakota Energy Research Center (UNDERC) carried out two bottoms recycle runs. The purpose of these 40 pass runs was to investigate the effect of two different start-up solvents on the composition of the product from pass to pass, especially the bottoms portion used as recycle solvent, and the final lined-out composition of the product. Runs 101 and 103 were carried out in the bottoms recycle mode in the Continuous Processing Unit (CPU). Zap, North Dakota lignite from the Indian Head mine was introduced at 5 lbs/h as a 30% slurry (wt % as-received coal) in recycle feed with H_2S addition in both runs. The nominal temperature was 440°C and the nominal pressure was 4000 psig H_2/CO (95/5). The startup solvent for Run 101 was a typical anthracene oil, A04. Run 103 was started up with a Process Development Unit (PDU) recycle solvent obtained from the University of North Dakota Chemical Engineering Department's Project Lignite. The PDU solvent was derived from Zap, North Dakota Indian Head lignite. The liquefaction products were examined from pass to pass in order to follow the compositional changes as the reaction proceeded toward steady-state composition (lineout) and to determine whether the products were chemically the same for both runs after 40 reactor passes. The preliminary characterization of the separated heavy products and their composition as compared with the composition of the oils are the focus of this report. Changes in the startup solvent as it reacts with coal and is diluted by coal-derived products are discussed with emphasis on the heavy components. Differences between the two runs started up with different solvents are described. 7 references, 5 tables.

32450 **(DOE/FE/60181—72) Cleavage of aromatic carbon-carbon bonds.** Kline, E.A.; Teichert, W.P.; Farnum, B.W. (Tennessee Technological Univ., Cookeville (USA). Dept. of Chemistry; North Dakota Univ., Grand Forks (USA). Energy Research Center). 1984. Contract FC21-83FE60181. 9p. (CONF-840805—4). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84010161.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

The search for a model substrate to use in evaluating relative reactivity of H-donors, under coal liquefaction conditions has led to this study of o-terphenyl. Results of cleavage reaction studies with o-terphenyl show that o-terphenyl couples in the presence of model H-donors and many coal derived solvents to form triphenylene, and forms biphenyl by cleavage. The latter reaction is of more interest as the yields are substantial, and the yields have application to the study of properties of solvents. Attempts to elucidate the mechanism involved kinetic studies, and reaction with a deuterated H-donor. The best mechanism appears to be that in which the low steady-state concentration of reactive H-donor attacks either ipso position in o-terphenyl followed by cleavage. This mechanism is known to occur at high temperatures. 7 references, 3 tables.

32451 **(DOE/FE/60181—81) Changes in asphaltenes and preasphaltenes with reaction conditions and effects on coal structure.** Knudson, C.L.; Baltisberger, R.J.; Woolsey, N.F.; Willson, W.G. (North Dakota Univ., Grand Forks (USA). Energy Research Center). Mar 1984. Contract FC21-83FE60181. 17p. (CONF-840805—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84010164.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

Asphaltene and preasphaltene data are presented to demonstrate the effect of temperature, pressure, and reducing gas composition on their hydrogen and phenolic content. The previous paper by Baltisberger showed how the hydrogen and phenolic content of the A and PA defined whether or not a coal derived product will be classified as such. The influence of processing parameters as discussed in this paper indicates that reduction in the number of phenolic functional groups and cracking are required to further convert asphaltene and preasphaltene material to distillates. That alcohol groups are present in aromatic bridging structures is indicated in the data in this report by the decreased MW of SR when processed with CO present since after hydrogenation an aliphatic bridge would cleave easier. The increased aliphatic hydrogen content in the asphaltene fraction when reacted with CO may also indicate that some alcohol groups were initially in the aromatic bridges. The presence of alcohol groups in long chain aliphatics is indicated because increased yields of long chain alkanes were observed when CO was present. The previous data have shown how operating conditions such as pressure and temperature affects the hydrogen content, phenolic content, and molecular weight range of asphaltene and preasphaltene fractions. The effects are reflected similarly in individual MW fractions of both A and PA material. The presence of alcohol groups in original coal (both lignites and bituminous coals) is strongly suggested. The preferential reaction of these alcohol groups with CO gas (but not H_2) to increase the hydrogen content of the asphaltenes, to reduce the overall MW distribution of coal, and to increase yields of alkanes indicates the beneficial effects of CO as a reductant of these functional groups which are present in both lignites and bituminous coals. 20 references, 8 figures.

32452 **(DOE/FE/60181—85) New iron oxide catalyst reduction activities with hydrogen sulfide and hydrogen.** Hattori, H.; Jones, F.A.; Ogawa, T.; Knudson, C.L.; Radonovich, L.J.; Stenberg, V.I. (North Dakota Univ., Grand Forks (USA)). 1984. Contract FC21-83FE60181. 10p. (CONF-840805—12). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84009700.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

Portions are illegible in microfiche products.

Various types of catalysts have been used for coal liquefaction. Among these catalysts, molybdenum and iron catalysts are most frequently used and they are usually combined with other metal oxides. Molybdenum catalysts, in the form of $Co/Mo/Al_2O_3$ wherein this notation represents some form of the metal oxides and the last species is the support, have been used in the H-Coal process. In others, iron catalysts have been used in the form of red mud which is mixed with elemental sufur. The activity of iron catalysts has generally been regarded as low when compared with xhat of molybdenum catalysts. However, iron oxide catalysts became highly active for the conversion of coal-related model compounds when used in the presence of H_2S and H_2. For coal liquefaction in the absence of a heterogeneous catalysts, the use of a mixture of H_2S and H_2 instead of H_2 resulted in an increase in conversion. Because of the interaction of H_2S with Fe_2O_3 and the fact that iron is presently the lowest cost transition metal, iron was selected as the basis metal for a new set of heterogeneous catalysts specifically designed for coal liquefaction using the H_2S-H_2 reducing gas medium. The catalysts were subjected to two reactions: hydrocracking of diphenylmethane to toluene and benzene, a model compound for the Ar-C bond cleavage of the coal structure, and hydrocracking of diphenyl ether to phenol and benzene, a model compound for the Ar-O bond cleavage of the coal structure. The reaction conditions for these reactions are summarized in Table 2. 4 references, 2 tables.

32453 **(DOE/LC/10977—1482) High resolution seismic survey of the Hanna, Wyoming underground coal gasification area.** (Emerald Exploration Consultants, Inc., Austin, TX (USA)). Aug 1983. Contract AC20-83LC10977. 87p. NTIS, PC A05/MF A01. Order Number DE84000308.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

In June 1983 a high resolution seismic survey was conducted at the Department of Energy, Laramie Energy Technology Center's underground coal gasification test site near Hanna, Wyoming. The objectives of the survey were to locate and characterize underground burn zones and to identify shallow geologic faults at the test site. Seismic data acquisition and processing parameters were based upon prior work in the area, and were specifically designed to emphasize reflections at the shallow, 61 to 91 meter (200 to 300 ft) depths of interest. Data were obtained on two north-south lines along the test site boundary in addition to a three-dimensional grid over the Hanna IV experiment area. Processing included time varying filters, deconvolution, trace composition, and three-dimensional areal stacking of the data in order to identify burn zone anomalies. Anomalies were discernable resulting from the rubble-collapse void above the burn zones in the vicinity of the injection wells at the Hanna IV experiment area. The fault studies disclosed faults at the Hanna IV experiment area which may be responsible for the unexpected problems experienced in the early in-site gasification tests. For the test site the fault system was found to be a generally arcuate east-west trending graben complex with numerous antithetic faults. 15 references, 33 figures, 6 tables.

32454 **(DOE/MC/10526—1609) Kinetics of coal gasification reactions at process conditions. Final technical report.** Gardner, N.C.; Zheng, C.; Pehmoeller, D.; Gorecka, B. (Case Western Reserve Univ., Cleveland, OH (USA). Dept. of Chemical Engineering). Jan 1984. Contract AC21-80MC10526. 71p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013652.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

An entire fixed bed coal gasification reactor is suspended from a large analytical balance for thermogravimetric measurement of the reaction rate. This thermobalance has advantages over the hanging basket types in that sample size can be larger, thermocouples can be embedded directly in the reacting bed, and there is more control over extraparticle mass transfer resistance. Steam gasification of a North Dakota lignitic coal was studied at pressures from 20 to 33 atmospheres and temperatures from 720 to 900°C. The observed reaction order was close to one. The gasification rates were essentially independent of the measured temperature. The suggested explanation for this behavior was that the particles act collectively, giving a large resistance to mass and heat transport. The reaction took place under a strong diffusional control. Gas chromatographic analysis of the products indicated that the carbon-steam reaction is the principal gasification mechanism. Steam was in excess, and the products underwent the water-gas shift reaction. Hydrogasification studies were complicated by the observation of an ignition phenomena in the coal bed when the exothermic heat of reaction could not be removed fast enough. An expression for the temperature dependence of the reaction rate was determined. 6 references, 28 figures, 9 tables.

32455 **(DOE/MC/14593—T9) Mechanism of catalytic gasification of coal char. Quarterly technical progress report No. 13, 1 January-31 March 1984.** Wood, B.J.; Tong, G.T.; Wise, H. (SRI International, Menlo Park, CA (USA)). 1 Jun 1984. Contract AC21-80MC14593. 11p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84014086.

Experiments are being performed to optimize the conversion of NaCl in the presence of carbon to an active steam gaification catalyst. During the past quarter we examined the effect on conversion of a pretreatment process in which NaCl-impregnated char is heated in a steam-CO^2 mixture at high space velocities. The addition of CO_2 to the pretreatment gas produces a significant enhancement in gasification activity, approaching that produced by a superior catalyst such as Na_2CO_3. 3 figures, 1 table.

32456 **(DOE/MC/19403—1544) Development of a hot gas cleanup system for integrated coal gasification/molten carbonate fuel cell power plants. Topical report, October 1982-December 1983.** Anderson, G.L.; Berry, F.O.; Gross, M.N. (Institute of Gas Technology, Chicago, IL (USA)). Jun 1984. Contract AC21-82MC19403. 151p. Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report summarizes the results of recent laboratory-scale studies conducted by IGT in support of (1) the development of the IGT mixed metal-oxide process for high temperature fuel gas desul-

furization and (2) the development of a high capacity, mass producible sorbent for the removal of HCl from high-temperature coal gases. The IGT mixed metal-oxide process is a conceptual process that removes sulfur-containing compounds from coal-derived fuel gases by contact with a multi-component reactive mixture of metal oxide sorbents. The objective of the process is to maximize the percentage of elemental sulfur formed during regeneration of the mixture with air and to minimize the formation of SO_2. The metal oxide sorbents tested included a cobalt oxide-silica, manganous oxide, iron oxide/chromia, iron oxide/silica, cobalt titanate, and zinc oxide. Based on the tests, the cobalt titanate, zinc oxide, and cobalt oxide/silica sorbents have been selected for further testing in a bench-scale unit. The HCl removal sorbent being developed by IGT is based on the use of a reactive moltent mixture of either lithium and sodium carbonates or lithium and potassium carbonates contained within an inert, porous ceramic matrix. The sorbent is prepared by a technique developed by IGT for the production of a similar media used for high temperature thermal energy storage. The results of the present study indicate that this preparation procedure is viable and results in a highly reactive, high capacity sorbent for HCl removal. Mass produced pellets containing 60 vol % of a molten alkali carbonate mixture (52 mol % Li_2CO_3/48 mol % Na_2CO_3) and 40 vol % MgO were found to be able to reduce the HCl content of a gas containing 99% CO_2, 3000 ppM H_2O and 400 ppM HCl to about 0.75 ppM HCl at a space velocity of 1000 h^{-1}, 600°C and atmospheric pressure. 11 references, 29 figures, 47 tables.

32457 (DOE/METC—84-8, pp 16-28) **Studies of initial reaction steps in the gasification of coal and selected model compounds.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract FG22-81PC40792.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

Considerable effort has gone into the design and construction of the new matrix isolation apparatus as well as the transient pulsed flow small particle coal sampling system. Initial testing of these apparatus has been completed and the new matrix isolation-FTIR system is now operational. We are presently in the process of collecting numerous experimental data from which a data base can be built. This data base will provide us with information concerning the initial reaction steps of coal gasification. Our main concern is centered on the identification of unknown intermediates and better understanding of the mechanism of tar formation. Preliminary studies on fluorinated coal samples give promising results from which information concerning the coal skeletal structure may be derived. Studies on whether the reactions of particular primary building blocks of coal lead to specific products have been initiated by adding isotopically substituted H_2O to the coal and studying the gaseous pyrolysis product distribution. Significant results are briefly discussed. 8 figures.

32458 (DOE/METC—84-8, pp 29-48) **Plasticity, agglomeration, and volatiles secondary reactions during gasification.** Howard, J.B.; Peters, W.A. (MIT, Cambridge, MA). Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-82MC19207.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective is to obtain improved quantitative understanding of the physico-chemical phenomena governing coal plasticity, the agglomeration of pyrolyzing particles of softening coal, and secondary or post-pyrolysis reactions of freshly generated tars under conditions pertinent to the operation of coal gasifiers. Some of the accomplishments are: design and development of a rheometer for measurement of the viscosity of coal melts at temperatures, heating rates, and reactive atmospheres pertinent to gasification process conditions have been performed; a preliminary prototype unit has been constructed and tested using a Pittsburgh No. 8 coal; data on secondary reactions of freshly formed coal pyrolysis tars were obtained using a dual chamber reactor system; preliminary studies were made on the effects of fresh char, active carbon and quartz surfaces on the secondary reactions of coal pyrolysis tars; gel permeation chromatography was used to monitor changes in the average molecular weight and the molecular weight distribution of the product tars. 14 figures, 3 tables.

32459 (DOE/METC—84-8, pp 49-58) **Coal gasification research studies.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-82MC19301.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this program is to study coal ash behavior, ash composition, and ash viscosity at various operating conditions in order to understand the mechanisms that contribute to low-melting ash and agglomeration. Seven runs of a Pittsburgh No. 8 coal char have been made in the 2-inch gasifier at 1800°F with both high (approximately 5 percent) and low (0.2 percent) oxygen concentration. The coal ash has been separated from the char for analysis of the chemical changes in the mineral matter during gasification. This separation was done with a sink-float procedure using bromoform as the liquid medium. The carbon conversions shown in Table 2 ranged from 35 to 98 percent in these runs, and at present, only preliminary petrographic analysis of the ash has been made. These results indicate: the presence of Fe_3O_4 with dispersed FeS. It is thought that FeS deposits on the reactor wall and is then oxidized; there are particles of Fe_2O_3 on the surface of clay particles. This may be due to the early formation of FeS-FeO melt or ferrous alumina silicate that is then oxidized to Fe_2O_3. 4 figures, 2 tables.

32460 (DOE/METC—84-8, pp 68-78) **Effects of inorganics and pore structure on char gasification.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81MC16117.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

It is the central objective of this research to distinguish the contributions to overall kinetics that are related to the pore structure from those attributable to surface reaction chemistry. To this end, a series of experiments were designed to provide data interpretation that could parallel and critically evaluate the model development. The random pore model, developed by Bhatia and Perlmutter (1980), interprets conversion data as a combination of chemical rates and structural changes, in terms of three parameters that characterize pore structure, particle size, and intrinsic kinetics. The experiments of this research provide independent information on both reaction kinetics and pore structure, thus, allowing critical tests of the model and making it possible to determine intrinsic rate constants without the interference of structural parameters. To extend the scope to include chars with significant inorganic additions, the model was also modified to describe the overall kinetics of such catalytic systems. Since the ultimate goal of modeling is understanding and prediction of both reaction kinetics and detailed structural change, experimental tests were devoted to these variables. Six char samples with different initial pore structures were generated from two coals by varying pyrolysis conditions. These chars were also impregnated with different concentrations of Na_2CO_3 and K_2CO_3 solution. Both catalyzed and non-catalyzed oxidation rates and their changes with conversion were measured with a thermal gravimeter analyzer in the temperature range of 380° to 500°C, essentially in the chemical kinetic control regime. Corresponding pore structure developments were measured by the combination of mercury porosimetry, CO_2 adsorption, and pycnometry. An atomic absorption technique was used to determine the amount of catalyst uptake and scanning electron microscopy served to visualize catalyst depositions. Results are discussed. 7 figures, 1 table.

32461 (DOE/METC—84-8, pp 79-87) **Heterogeneous kinetics of coal gasification.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract FG22-81PC40786.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this research is to conduct fundamental experimental studies of heterogeneous gas-char reactions at high temperature and pressure (up to 1400°F, 550 psig), using transient techniques in a gradientless reactor system coupled with modulated supersonic molecular beam sampling. Past accomplishments on this project have included: (1) successful demonstration of the application of the entire apparatus and transient kinetic techniques to heterogeneous char-gas reactions via carbon dioxide gasification; (2) development of computer codes both to simulate the expected tran-

sient behavior of various carbon dioxide gasification mechanisms in the literature for model discrimination purposes and for subsequent parameter estimation; (3) char-carbon dioxide gasification studies where fundamental information was obtained from transient kinetic data regarding the mechanism, kinetic rate constants, and effective active site concentration for coconut char and New Mexico subbituminous coal char at temperatures from 680° to 770°C and pressures from 8 to 30 atm. More recent accomplishments are: (1) carbon dioxide gasification studies with lignite PSOC-623; (2) investigation of mechanism of CO inhibition of carbon dioxide gasification; (3) measurement of intraparticle mass transport properties of coal char by a new technique which is based on an extension of the transient kinetic approach; (4) and automated data logging and control of apparatus during the course of a transient experiment. 5 figures.

32462 (DOE/METC—84-8, pp 88-98) **Influence of changing particle structure on the rate of gas-solid gasification reactions.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81MC16053.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this work is to determine changes in the particle structure of coal as it undergoes the carbon/carbon dioxide reaction ($C + CO_2 \rightarrow 2CO$). An experimental system that combines a pulse reactor with a flow-type BET apparatus will be used to study the influence of the changing solid structure on the gas-solid reaction. Approximately four of the following coals will be studied: Wyodak, Illinois No. 6, Kentucky No. 9, Wilcox lignite, Kentucky Elkhorn No. 3, Pittsburgh No. 6, Kentucky No. 11, and Kentucky No. 3. The changes in surface area and effective diffusivity with coal conversion will be determined, and an overall rate model including the effect of these changes will be developed and tested for each coal studied. Accomplishments are discussed for the following tasks: (1) data acquisition; (2) model developent; and (3) measurement of reaction rate data. 8 references, 11 figures, 1 table.

32463 (DOE/METC—84-8, pp 99-106) **Mechanism of catalytic gasification of coal char.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-80MC14593.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

In our experimental program, we used selected specimens of chars and a carbon black, and we placed major emphasis on three experimental techniques to provide information on chemical pathways and intermediates in char gasification reactions: (1) temperature-programmed reaction (TPR), which revealed the rate of formation of stable gaseous products resulting from the reaction of gaseous reactant with the coal char, as a function of temperature, mass of char, and gaseous reactant pressure; (2) high-temperature Knudsen cell mass spectrometry, which complemented TPR experiments by measuring the partial pressures of gaseous species in equilibrium with the solid char as a function of temperature and the gaseous environment; (3) in situ electronic spin resonance spectroscopy, which provided information on the chemical nature and environment of reactive species in the char under gasification conditions by evaluation of free radical concentrations and line widths. The results of our experiments have provided a sound basis for understanding the mechanism of catalyst action in the gasification of char by steam or carbon dioxide. It appears that effective catalysts are inorganic salts capable of forming a molten oxide film that spreads over the char surface. 5 figures, 1 table.

32464 (DOE/METC—84-8, pp 116-128) **Entrained-flow pyrolysis and gasification in the METC advanced gasification facility.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this program is to conduct high-temperature, high-pressure systematic studies of primary devolatilization, secondary volatiles reactions, and heterogeneous reactions at conditions pertinent to entrained gasifiers. Devolatilization is a complex phenomenon involving seven major variables, which is one reason it has defied rigorous, mechanistic understanding and modeling. Because of the number of variables involved, it is impractical to develop a matrix which systematically varies all seven. For the purposes of the Phase I test program, coal type and particle size (except for one excursion) will be held constant throughout. Of the remaining five, temperature, pressure, and residence time will be systematically varied through a series of tests while the entraining gas composition is held constant. The last variable, the particle time-temperature history, is impossible to hold constant in any experimental apparatus like the AGC entrained reactor. This is due to the inherent thermal property differences of various gases, the fact that these properties are functions of temperature and pressure, and the need to preheat gases to various levels in order to reach different reaction temperatures while maintaining essentially isothermal conditions. The proposed test program approaches this aspect by purposely varying the entraining gases and degree of preheat in the initial stages of the program so that the acquired knowledge can be used to minimize te variations in the subsequent tests. 7 references, 2 figures, 6 tables.

32465 (DOE/METC—84-8, pp 129-138) **Development of BEACON technology.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract FC21-80MC14400.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this research is to develop catalysts, reactors, and systems to utilize the unique, BEACON chemistry for the cogeneration of methane or hydrogen and combined-cycle electric power or steam from low-heating value fuel gases derived from coal, shale, or other sources. During the past year, a two fluid-bed, bench-scale reactor system (tandem system) was constructed and operated extensively with the best of our methane-forming catalysts. The successful operation of this unit marked the first demonstration of simultaneous deposition of carbon in one reactor, steam gasification of carbon in a second reactor, and transfer of carbon-rich and carbon-lean solids between the two reactors. Due to the unique fluid mechanical properties of the catalytic solids, we have been able to operate th two reactor system in a steady-state mode using very small equipment for this type of experimentation. Experimentation at a laboratory scale was concentrated on the development of catalyst modifications that would inhibit the formation of methane and enhance the formation of hydrogen during the steam gasification of deposited carbon. Twenty catalysts were screened, and two excellent candidates were obtained. These two catalysts showed very good stability and selectivity through 50 cycles of laboratory-scale carbon deposition and steam gasification. Results of this experimentation are summarized. 3 figures, 3 tables.

32466 (DOE/METC—84-8, pp 139-147) **Photo-assisted electrolysis applied to coal gasification.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81MC16377.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective is to investigate photo-assisted electrolysis of coal gasification, its detailed reaction mechanisms, and feasibilities for practical applications. Accomplishments include elucidation of oxidation mechanisms of coal slurries, and demonstration of solar radiation-assisted coal gasification employing semi-conductor electrodes. Experimental results from coal slurries oxidation, indicate that the iron ions leached out from coal are responsible for major anodic currents. The Fe(II) is electrolytically oxidized to Fe(III) at the anode, which oxidizes coal to various products including CO_2. The catalytic nature, after the electron transfer, has been proved by performing various experiments. The rate constants for the catalytic reaction have been determined for various solution catalysts under various conditions. Catalytic oxidation of coal slurries was shown to be a rate determining step. Catalysts such as Br_2 and Ce(IV) show at least an order of magnitude improvement in their rate constants over Fe(III). 8 references, 5 figures, 1 table.

32467 (DOE/METC—84-8, pp 148-155) **Steam pyrolysis of coal for two-stage gasification.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81FE05123.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The present program is directed at developing a basic understanding of steam pyrolysis and generating basic engineering data so that optimum conditions for obtaining high yields of product gas in the pyrolysis stage of a two-stage gasifier can be defined. A flow system previously used at Avco to study coal combustion and slag flow was made available and modified for the steam pyrolysis studies. Modifications and shakedown have been completed and tests to establish the practical limits of operational parameters for the steam pyrolysis stage of a two-stage gasifier are in progress. Pyrolysis yields as a function of process parameters such as temperature, enthalpy, and flow rates are being investigated. Process design studies will be performed, along with the experimental studies, to be sure that the parametric levels being studied are practical as far as process systems are concerned. The test results obtained thus far show that the high pyrolysis yields obtained in a small batch reactor can be reproduced under a range of conditions in a high throughput flow reactor. The results thus support the conclusions of the Gas Research Institute (GRI) report which projects advantages of rapid steam pyrolysis and the resulting impact on gasification economics. The results also indicate that additional advantages might be realized from the use of ultra-fine coal, CO_2 as a pyrolysis media, and the injection of alkali salts for the purpose of hot gas cleaning. These process options, as well as parameters affecting the basic pyrolysis reaction, should be investigated in order that designers of advanced gasification processes can take advantage of the benefits of rapid steam pyrolysis. 5 figures.

32468 (DOE/METC—84-8, pp 156-159) **Studies toward improved techniques for gasifying coals.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-80MC14875.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

Yields of gases and liquids obtained from the pyrolysis of raw coal in steam are to be determined in laboratory-scale equipment. Liquids are to be fractionated using SESC and the fractions analyzed by elemental analysis, gas chromatography, mass spectrometry, and high-pressure liquid chromatography (HPLC) as required to characterize the liquids. A coal injection reactor was designed, constructed, and put into operation at up to 50 atm pressure and 1000°C. This reactor proved capable of accepting up to 200 mg of coal per batch and of steam temperatures adjustable to match reactor temperature. Methods for the fractionation (SESC) and analysis (elemental analysis, molecular weight distribution, boiling point distribution, and H-NMR) have been developed and/or implemented. Survey runs have been carried out identifying a promising region for operation and establishign the need for pretreatment in order to obtain high liquid yields. Following more detailed studies, the results are to be analyzed and optimum operating conditions projected for commercial operation. It has been found that: (1) high yields of liquids are obtained in the flash pyrolysis of coal in high-pressure steam, provided that coal is first pretreated by soaking in steam at elevated pressure and low temperature. Results are presented for coal pretreated in 50 atm steam at 320° to 360°C for 30 minutes; (2) the effects of pretreatment are lost if the treated sample is exposed to ambient air before pyrolysis but are retained if the sample is retained under an inert atmosphere; (3) mean molecular weight and heteroatom content decrease with increasing pyrolysis temperature. 2 figures.

32469 (DOE/METC—84-8, pp 160-168) **Flash pyrolysis of coal with reactive and non-reactive gases.** Fallon, P.; Sundaram, M. (Brookhaven National Lab., Upton, NY). Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this task is to develop a systematic process chemistry data base for the rapid pyrolysis of coal with reactive and non-reactive gases. The results of this task serve as a basis for developing and evaluating processes for the conversion of coal to liquid and gaseous fuels and feedstocks. A highly instrumented 1-inch I.D. by 8-foot long downflow entrained tubular reactor has been constructed and is available to obtain the system chemistry information. The operating conditions can range from atmospheric to 270 atmospheres, temperatures from room to 1000°C, coal flow rates from 0.10 lb to 4 lbs/hr, and gas flow rates from 0 to 20 lbs/hr. Light gas and liquid compositions are monitored continuously with an on-line process gas chromatograph. Heavier liquids, tars, and chars are collected and mass balances made. Coal particle residence times range from approximately 0.2 sec to 20 sec. The yields and distributions of all gaseous and liquid products are determined as a function of the type of coal and process gas over a wide range of temperature, pressure, and residence times, as well as coal and gas feed rates. Material balances are made for all the major constituents of the coal used and this information, plus product yield information as a function of residence times is applied to a kinetic model of the overall reaction. The data are tabulated, correlated, and presentd in reports. New process potentials are pointed out. The more important results obtained to date are discussed. 4 figures, 2 tables.

32470 (DOE/METC—84-8, pp 169-175) **Application of a cold metal reactor wall to the entrained-bed gasification of coal.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-82MC19313.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The overall objective of the program is to evaluate the feasibility of using a water-cooled metal liner in a short residence time entrained flow coal gasifier. The specific objetives are: (1) to evaluate the slagging characteristics of a water-cooled metallic reactor wall; (2) to obtain heat transfer data on the cold wall section; (3) to evaluate the effect of the cold wall section on gasifier performance; and (4) to evaluate the threshold conditions for slag adherence to the metal wall. The test program will consist of 12 gasification tests. Two types of coal, Illinois No. 6 sub-bituminous and North Dakota lignite, will be used in order to evaluate shedding characteristics of the cold wall section with two types of coal and ash. The first two tests were run to determine the operating characteristics of the gasifier with the cold wall section in place. The next three tests were made at different oxygen-to-coal ratios with Illinois No. 6 coal. Results are discussed. Two tests are now planned to attempt to determine the threshold conditions for slag adherence to the metal wall, by changing either the coolant water flow rate or the oxygen-to-coal ratio. The next three tests will be conducted with North Dakota lignite and with three different oxygen-to-coal ratios. The last two tests will be conducted without the cold wall section in place. The coal used will be Illinois No. 6 and two oxygen-to-coal ratios used previously. This should show the effect of the cold wall section upon the performance of the gasifier. 4 figures.

32471 (DOE/METC—84-8, pp 179-182) **Testing evaluation and validation of detailed mechanistic computer codes for fluidized-bed gasifiers.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-82MC19265.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

Two large, time dependent, hydrodynamic codes have been developed by the Department of Energy to provide insight into localized phenomena, to be used in solving specific scale-up and design problems and to provide information for phenomenological models. These codes, FLAG (JAYCOR) and CHEMFLUB (S-Cubed), have been previously developed to the stage where the models were defined, the FORTRAN codes were operable on VAX and IBM computers, and limited validation studies have been performed. The purpose of this 2-year contract is to test, evaluate, and validate both of these codes. This describes the program and its justification, discusses the results from the first tasks, and describes the possible impact of the program on the development of coal gasification technology.

32472 (DOE/METC—84-8, pp 183-190) **Coal gasification research studies.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-82MC19301.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this work is to determine the effect of system pressure and system temperature on bubble characteristics in fluidized bed. Building of the pressure probes for bubble measurement is completed. The exact configuration of the pressure probe and the data acquisition hardware, including a digital computer, have been determined. Computer programs for data acquisition and data analysis have been developed and tested. Calibration and testing of the pressure probe in both two- and three-dimensional fluidization columns are also finished. Experimental data on the 12-inch diameter fluidization unit operating at atmospheric condition have been obtained. 5 figures.

32473 (DOE/METC—84-8, pp 191-198) **High-pressure fluidization cold model.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this study is to develop a data base for the effects of pressure on fluidization parameters. The High-Pressure Fluidization Cold Model Facility was designed to include a 61-cm pressure vessel equipped with 24 observation ports, a nitrogen supply system, and peripheral equipment. The pressure vessel was designed such that plexiglas fluidization models of diameters up to maximum of 40.6 cm could be inserted. Its design pressure was 6894.8 kPa. After a period of shakedown testing, which included the replacement of the original sight ports with better designed units, a series of fluidization velocity tests were performed using a 10.2-cm cylindrical model. After completion of these tests, photographic studies were conducted using a 20.3-cm two-dimensional model. Currently, tests are being conducted using capacitance (static) probes to study flow regimes and bubbling in a 20.3-cm cylindrical model. 4 figures.

32474 (DOE/METC—84-8, pp 191-205) **Hydrodynamical basis for scaling fluidization data on jet penetration and mixing relevant to fluidized-bed coal gasifiers.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81MC16440.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

This is a 2-year research effort where the major objective is to develop correlations, based on existing data, that will be useful for the scale-up of fluidized-bed coal gasifiers. The project goals are to: summarize and categorize fluidization data on jet penetration and mixing relevant to fluidized-bed coal gasifiers; review the hydrodynamical theories of fluidization relevant to jet penetration and develop nondimensional relationships describing fluidization; correlate teh data on jet penetration and mixing using nondimensional parameters from the hydrodynamic theories of fluidization. A correlation of jet penetration height, using nondimensional hydrodynamic parameters, has been developed and the sensitivity of that correlation to those parameters has been established. The Froude number is the dominant hydrodynamic parameter. However, both the gas-to-solid density ratio and the Reynolds' number have important influences upon the correlation. A comparison between the correlation, the data of several investigators, and other correlations has been made. Representative comparisons are presented. Correlations of bubble velocity and bubble/cloud geometry have been developed, using a theory of bubble motion in a fluidized bed. The correlation for bubble velocity is compared with data for both isolated bubbles and slugs, excellent agreement is demonstrated. The correlation for the relative dimensions of the cloud/bubble accurately predicts available data for isolated bubbles. 4 figures, 1 table.

32475 (DOE/METC—84-8, pp 206-214) **Evaluation of mechanistic models for coal gasification.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The prime objective of the contract is to evaluate three computer simulation models of fluidized-bed and entrained gasification reactors. The models to be tested are CHEMFLUB of System, Science, and Software (SSS) and FLAG and FLAME of JAYCOR. The models are to be tested for the soundness of their mathematical basis and numerical methods, accuracy of coding, and appropriateness of the several constitutive relations used in the models. Also, the codes are to be exercised to simulate experimental situations and results. The CHEMFLUB fluidized-bed gasification model was exercised at METC to simulate Westinghouse cold flow experiments reported by Yang and Keairns. The Westinghouse experimental setup consisted of a semi-circular transparent plexiglas column with simulated gasifier section. The experiments studied fluidization characteristics of a cenral jet injected into a gasifier section which is fluidized by background flow through char-ash separator region. The results show the bed to be sluggish and compare favorably with the experimental results in terms of jet penetration and bed expansion data. When compared with the experimental results of Yang and Keairns, the computed gas velocity distributions differ drastically both in terms of magnitude and profile shape. 8 figures.

32476 (DOE/METC—84-8, pp 215-224) **Gasification modeling support.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The purpose of this continuing study is to evaluate and utilize detailed models developed for the Advanced Gasification Project. These activities concentrated on the fluidized-bed codes, CHEMFLUB (S^3) and FLAG (JAYCOR), and the entrained codes, FLAME (JAYCOR) and PCGC-2 (BYU). This report describes the statistical analysis of a numerical simulation of bubble motion using CHEMFLUB, the Systems, Science, and Software model. 5 figures, 1 table.

32477 (DOE/METC—84-8, pp 225-237) **Prediction and measurement of entrained coal gasification processes.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81MC16518.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The general objectives of this coal gasification program are to develop a basic understanding of the physical and chemical processes involved in entrained coal gasification and to incorporate results in a model of entrained gasification processes. Specific tasks to be performed during this contract include: (1) entrained coal gasification measurements for various coals at different pressures; (2) completion and critical evaluation of the two-dimensional coal gasification model; and (3) application of the results to industrial and METC needs. The experimental gasification tests were to incorporate improved test reliability through more uniform feeding of the coal, oxygen and steam, improved measurement accuracy of the feed rates, and improved sampling and analysis accuracy. Tests with various coal types and tests at elevated pressure were to be performed. The completed two-dimensional entrained coal gasification model was to be critically evaluated, refined, and prepared for industrial and METC use. Additional velocity and turbulence data were to be collected with the Laser-Doppler Velocimeter in the cold flow jet mixing facility. Results were to be reviewed with a Technical Advisory Committee. A data book for code evaluation was to be prepared to include detailed profile data from entrained coal gasifiers, pulverized coal combustors, gaseous combustors, and cold flow jet mixing studies. Accomplishments are presented for: (1) pulverized coal gasification measurements; (2) cold flow mixing experiment; and (3) gasifier model development. 6 figures, 1 table.

32478 (DOE/METC—84-8, pp 238-240) **Utilization of the EPRI/S^3 entrained flow coal gasification model.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective is to evaluate an entrained flow coal gasification computer model (developed by Systems, Science, and Software [S^3] for the Electric Power Research Institute [EPRI]) for the prediction of transient gasifier performance using a large computer code. The EPRI entrained flow (EEF) program and three subprograms were successfully compiled on the CRAY machine. Four minor programming problems were encountered, namely: use of SEGMENTATION tree, the INCLUDE command, the PARAMETER feature, and double precision arithmetic. These problems were overcome rather easily using alternative procedures at Los

Alamos. The sample problem given in the user's manual was reproduced within 2 percent of all salient variables. At present, we are trying to run a simple; cold, ideal-flow, cylindrical jet of air into air at 1 bar pressure to compare it with results from another code called SIMMER. The latter compared very well with an analytic solution. We have no results at this time because of the EEF program goes unstable very early in the calculation.

32479 (DOE/METC—84-8, pp 241-253) **Coal gasification reactions with on-line, in situ FT-IR analysis.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81FE05122.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The goal of this program is to develop the technique to characterize a raw coal with a few simple tests and use this characterization to predict the coal's behavior in a gasifier. Accomplishments include the following: (1) acquisition of a detailed set of data for rapid and slow pyrolysis for a set of coals of varying rank. Data include yields and composition of char, tar, and gas as functions of time and temperature (up to 1300°C) at 1 atmosphere; (2) development of a pyrolysis theory capable of simulating the data using a set of coal functional group parameters which depend on rank but are independent of pyrolysis apparatus and a set of kinetic rate for each functional group which depend on the functional group but are independent of coal rank; (3) demonstration of in-situ analysis of pyrolysis gases at high temperature by FT-IR; (4) development of a swelling model which is coupled to the pyrolysis model for gas evolution and coal viscosity; (5) initial application of a tar evolution model. 7 figures.

32480 (DOE/METC—84-8, pp 254-258) **Theoretical and experimental studies of fixed-bed coal gasification reactors.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract FG22-80PC30219.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objectives of this research is to develop mathematical models to get a better understanding of fixed-bed coal gasification reactors. The specific goals of the project are: (1) develop and test a laboratory fixed-bed reactor in order to generate data for validating existing models and to determine model parameters; and (2) interpret the data using dynamic models of the gasifier in order to identify sensitive parameters. Modify the model based on the observed results. Accomplishments are: (1) a one-dimensional model to describe the steady-state and transient behavior of fixed-bed gasifiers of the Lurgi type have been developed, coded into a computer program, and tested using published data; (2) a two-dimensional model which takes into account radial variations, as well as dispersion of heat, has been developed for studying the behavior of the laboratory-scale fixed-bed reactor and is now operational; and (3) construction, testing, and operation of a laboratory fixed-bed coal gasification reactor to generate temperature and composition profiles which can be used to exercise the model developed above. 1 figure, 1 table.

32481 (DOE/METC—84-8, pp 261-272) **Development of a process for the simultaneous high-temperature removal of alkali and particulates in pressurized gasification systems.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81MC16372.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

This program is directed at performing experimental and analytical investigations, system designs, and cost estimates to ascertain the feasibility of using aluminosilicate-based getters for controlling alkali in pressurized, hot-gas cleaning systems. Its overall objective is to develop a comprehensive plan for evaluating a scaled-up verison of the gettering process as a unit operation or as an integral part of a particulate removal device. The Westinghouse program is composed of four technical tasks. These tasks are: (1) process thermodynamic projections; (2) getter selection and qualification; (3) system performance projections; and (4) program definition for concept scale-up. Tasks 1, 3, and 4 are basically analytical investigations that depend on the experimental kinetic studies to be conducted in conjunction with Task 2. Task 1 input includes phases and compounds identified by X-ray diffraction analysis of reacted getter pellets. The quantity of volatile alkali in the coal-derived fuel gas is then predicted thermodynamically. Task 3 is directed to analysis of the experimental data in three areas: kinetic modeling studies using the bench-scale and TGA system data, process modeling, and an engineering assessment of the alkali gettering system. In Task 4, input from the other tasks will be used to meet the overall objective of the program. Accomplishments for the 4 tasks are described. 4 figures, 4 tables.

32482 (DOE/METC—84-8, pp 281-291) **Low-energy process for separating hydrogen and methane in advanced coal gasification.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-80MC14386;AC21-83MC20183.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objectives are: (1) to develop coal-based sorbents for H_2/CH_4 separation which are lower cost than activated carbon and the use of which will result in a lower energy requirement than using other sorbents or using other separation processes; (2) to gather basic information on the cyclic, fixed-bed processes, and to compare them with the moving-bed processes. Modeling of temperature and pressure swing separation will be done; (3) to develop a combined H_2CH_4 separation and pollutants cleanup process based on preferential adsorption and staged desorption; and (4) to develop pressure swing separation processes for separating $H_2/CO/CH_4/CO_2/H_2S$. Adsorption and separation of the ternary system: $H_2/CH_4/H_2S$ (with 1 percent of H_2S) has been studied and the following have been found: (a) preferential adsorption and sorbent studies; H_2S and CH_4 adsorb much more strongly than H_2 on all carbons. Montana char adsorbs equal amounts of CH_4 from CH_4/H_2 mixtures as commercial activated carbons do; (b) fixed-bed cyclic process; temperature-swing separation using activated carbon and coal char effectively separates a 50/50 mixture of H_2/CH_4 into 90/10 products. A pore-diffusion model has been developed which adequately predicts the performance of temperature-swing data and has been shown to be superior than the equilibrium models; (c) combined separation cleanup process; initial experiments are being conducted to explore the feasibility of combining the separation process with the acidic pollutants scrubbing process, using the same coal-base sorbent. 6 figures, 2 tables.

32483 (DOE/METC—84-8, pp 292-300) **Calcium silicate cement sorbent for H_2S removal and improved coal gasification processes.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective is to develop commercial silicate-bearing cements for in-situ desulfurization of gases and to investigate the improved (catalytic) gasification in low and medium Btu fluidized-bed gasifiers. The preparation procedure and conditions for agglomerating ACS (agglomerated cement sorbent) pellets using a drum pelletizer have been established. The 40 mm I.D. bench-scale FBG tests using simulated gas mixtures showed that these pellets have a sulfidation capacity of about 55 to 65 percent in the temperature range of 900° to 1000°C are almost completely regenerable during cyclic use. The 1-inch I.D. FBG tests performed by our collaborator, the Foster-Wheeler Corporation, using Illinois No. 6 coal indicated that greater than 95 percent sulfur removal from the fuel gas is observed the the ACS pellet in the temperature range of 800° to 950°C and at a Ca/S ratio of 2.5 to 3.0, compared to 50 to 65 percent sulfur removal for Greer limestone under the same conditions. In order to find out the reason(s) for the enhanced gasification efficiency with the ACS pellets, two sets of tests were performed of the catalytic effect of sorbents or diluents (i.e., ACS pellet, Greer limestone and sand) on the gasification efficiency of a New Mexico coal char using the 40 mm I.D. FBG. It was found that the coal char gasification either with CO_2 gas or with O_2 gas is very much enhanced in the presence of either ACS pellets or Greer limestone over the case of coal char alone. However, little difference was found between the ACS pellet and Greer limestone in the degree of enhancement of gasification efficiency. This effect for both sorbents was significantly enhanced when a small amount of H_2S gas was

introduced to carry out the sulfidation reaction with the sorbent simultaneously. 5 figures, 1 table.

32484 (DOE/METC—84-8, pp 301-312) **Acid gas removal process.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-80MC14399.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this project is to: expand the CNG acid gas removal (AGR) process data base; design and develop improved triple-point carbon dioxide crystallizer; determine the fate of trace contaminants in the CNG process; and investigate pumping of solid carbon dioxide slurries. Briefly, the CNG process removes sulfur compounds, residual trace contaminants, and carbon dioxide from synthesis gas mixtures at moderately lower temperatures and is especially suited to medium- to high-pressure (300 to 1000 psia) gas streams containing substantial amounts of carbon dioxide. Accomplishments are as follows: (1) triple-point crystallizer construction was completed in summer 1982; (2) triple-point crystallization of carbon dioxide sharply rejects hydrogen sulfide (and other contaminants); (3) fates of trace contaminants entering CNG acid gas removal process have been determined; (4) several types of pumps for pumping triple-point slurries of solid carbon dioxide in liquid organic carriers have been evaluated; (5) improved separation of carbon dioxide from hydrogen sulfide compared to the first generation CNG triple-point crystallizer has been demonstrated; (6) path of trace contaminants within the process has been defined; no difficulty is envisioned with contaminant accumulation in the process or with contaminant removal from the crude gas; and (7) minimum positive suction head for pumping bubble point slurries of solid carbon dioxide in organic liquids has been determined, the solid carbon dioxide crystals settle rapidly in quiescent slurry, but show no tendency to agglomerate and are easily resuspended. 8 figures. 1 table.

32485 (DOE/METC—84-8, pp 313-321) **Studies in tar formation and separation in coal gasification systems.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-82MC19208.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of the research program is to investigate the problem of tar formation, control, and separation, both during gasification and from the gasifier off-gas stream, in fixed-bed gasifier systems. In the present research program, the devolatilization section alone is simulated on a laboratory gasifier, with contact between coal and a synthesis gas of appropriate composition, at suitable temperatures and pressures. Next, the product gas stream is led through cracking (catalytic and noncatalytic) and condensation (wash spray quench or indirect) units. A total of 48 runs would have been completed by the time of this paper. Some of these are summarized in Tables 1 through 4. Future runs will be carried out only with Coal No. 230 (noncaking Subbituminous B Montana Rosebud) and Coal No. 1188 (medium Volatile Bituminous Illinois No. 6). Coal No. 525 (Dietz No. 3 Subbituminous B Wyoming), however, is also satisfactory for the studies while Coal No. 997 (High Volatile A Bituminous West Virginia Coal, Pittsburgh Seam) tends to cake and, hence, will not be investigated further. Additionally, a reactor operating pressure of ~ 30 psig rather than 0 psig appears more convenient for the atmospheric pressure runs, in order to cater to pressure drops across the bed and along the lines. The chars will be weighed for all runs while tars will be collected and weighed on selected runs. The tars will be analyzed for molecular weight and composition, for selected runs. The off-gases will be analyzed for selected runs. Tar scrubbing results on some runs will also be reported. 3 figures, 4 tables.

32486 (DOE/METC—84-8, pp 322-336) **Thermal reactions of aromatics with CO.** Longwell, J.P.; Williams, G.C.; Peters, W.A. (MIT, Cambridge, MA). Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract FG22-80PC30229.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective is to study quantitatively thermal reactions of pure aromatic compounds including phenolics in the presence of CaO, including rates, extends, and stoichiometry of the conversion reactions, effects of CaO physical and chemical properties, and CaO lifetime and activity. Applications to coal gasification including tar management, improved by-product values, pollutant control, heteroatom reduction, and selective dearomatization are of interest. The effect of calcining temperature and calcining time on the activity of CaO for the pyrolysis of polycyclic aromatic hydrocarbons was studied by determining the extent of pyrolysis of 1-methylnaphthalene over the solid at a fixed temperature (550°C) and residence time (1 s). Maximum activity of the oxide was obtained at a calcining temperature between 700° and 800°C and a calcining time of at least 3 hours. Pyrolysis of 9-methylanthracene was studied between 250° and 700°C. Below 600°C, 9-methylanthracene is thermally stable over quartz but undergoes more than 80 percent conversion over CaO. At temperatures below 400°C, the conversion of this polycyclic compound over CaO is essentially constant (~ 37 percent). This is believed to be a result of the formation of a surface complex, which leads to extensive coking at high temperatures. Although coke, anthracene, and CH_4 were the major products for pyrolysis over both CaO and quartz, the vast difference in the molar ratio of CH_4 to anthracene between the solids suggests that the pyrolysis mechanism over CaO is dissimilar to that over the more inert quartz. 11 figures, 1 table.

32487 (DOE/METC—84-8, pp 337-346) **Coal gasification and tar conversion reactions over calcium oxide.** Longwell, J.P.; Peters, W.A. (MIT, Cambridge, MA). Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-81MC16026.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective is to investigate, for freshly formed coal pyrolysis tars and reaction conditions pertinent to coal gasification, the effects of CaO on: (1) the selectivity of tar cracking reactions; (2) removal of phenolic and other oxygenated compounds; (3) tar global properties including viscosity, storage stability, and coking tendency; (4) gasification rate of tar cracking products, especially carbon; and (5) production of light gases and liquids. Preliminary results of coal volatiles generation and cracking experiments indicate that CaO obtained from calcining $Ca(OH)_2$ in-situ can drastically reduce the absolute yield of tars. At 700°C, about 73 weight percent of the fresh tars, generated from 1 gm of Pittsburgh seam (No. 8) bituminous coal is reacted through secondary reaction with 0.45 gm of CaO with a 0.13 sec contacting time as compared to 19 weight percent of tar removal due only to homogeneous vapor-phase thermal cracking with a volatiles residence time of 2.2 sec. The production and yields of methane, hydrogen, and ethylene gases are also significantly increased. Overall material balances generally appear to be satisfactory. Preliminary results on effects of secondary reactions on the phenolic content of fresh pyrolysis tars (by nonaqueous thermometric titration, using acetone as the thermometric indicator) are given in Table 3. The fact that about 85 to 90 weight percent of the phenolic oxygen in the original tars is removed in the presence of CaO, indicates the strong activity of CaO for interaction with phenolic functional groups in coal tars. A detailed literature review has been performed to obtain a better understanding of the unusual thermo-chemistry of CaO with organic compounds, especially aromatics. 5 figures, 1 table.

32488 (DOE/METC—84-8, pp 347-355) **Thermal and catalytic cracking of tars and tar constituents from coal gasification processes.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective is to investigate the tar pyrolysis for the purpose of determining the operating conditions for maximizing gas and char production. Generally, inexpensive materials are screened to evaluate their effectiveness as tar cracking catalysts. A final goal is to test kinetic models of tar cracking to generate expressions for the rate of tar pyrolysis reactions. Our results were obtained by use of a fixed-bed reactor (alonized stainless steel) with an I.D. of 2.7 cm in which the catalytic materials were packed in beds of thicknesses in the range of 1 to 6.4 cm. The residence time of the tar vapor carried by helium gas varied from 0.4 to 10 seconds. When the catalytic effectiveness of various packed beds were evaluated

and compared, the bed thickness and the residence time were, in most cases, 6.4 cm and 2.4 seconds, respectively. The pyrolysis temperature has a very large effect on the tar conversion to gases, light oils (mostly BTX), and chars. It was found that both synthetic and natural zeolites having large pore sizes (≧ 0.7 nm), large surface areas and large number of strongly acidic sites are very effective catalysts for tar converison to carbon and gases. Examples are synthetic faujasites (X- and Y-types) and natural chabazite. 5 figures, 1 table.

32489 (DOE/METC—84-8, pp 356-357) **Process development studies in coal gasification.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AT03-79ET14883.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objectives of this work are the following: (1) the production of light hydrocarbons, principally C_1 through C_4 directly from coal in a single stage operation. Use of appropriate catalysts permits temperatures of the order of 500°C and pressures on the order to 1000 to 1500 psia, which are mild for coal gasification; and (2) steam reforming of aromatic compounds followed by steam reforming of coal-derived liquids. The products of this operation will be a source for molecular H_2, a source for synthesis gas (CO and H_2) or an ultimate high Btu fuel product. Coal has been successfully hydrogenated and hydrocracked to methane yields of 50 to 60 percent by weight of the coal at temperatures below 600°C and pressures below 1500 psi using an appropriate catalyst. Yields of 50 to 60 percent by weight of the coal at temperatures below 600°C and pressures below 1500 psi using an appropriate catalyst. Yields of 50 to 60 percent by weight, C_2-C_4 hydrocarbons have been obtained at temperatures below 500°C and pressures below 1500 psi using a different appropriate catalyst. The catalyst composition will be identified when the patent position has been defined.

32490 (DOE/METC—84-8, pp 395-407) **Steam reforming of aromatic hydrocarbons.** Chen, I.E.; Goyal, S.K.; Hanson, F.V.; Oblad, A.G. (Univ. of Utah, Salt Lake City). Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The specific objectives of the investigation were as follows: (1) to develop a catalyst of sufficient activity to reform aromatics; (2) to determine the conversion of simple aromatics as a function of the main variables (temperature, pressure, contact time, and steam/carbon ratio); (3) to determine the kinetics of the reforming reactions; (4) to determine the reaction mechanisms; and (5) to determine the feasibility of the steam reforming of heavy coal liquids to produce synthesis gas and, if feasible, investigate the effects of the main variables. It has been demonstrated that heavy coal liquids can be steam reformed to produce synthesis gas. A mechanism has been prepared for the reaction of steam and benzene. A catalyst has been developed which has high activity for steam reforming including aromatic hydrocarbons. An initial indication of the reaction kinetics for the reforming of benzene and SR II coal liquids have been derived from the data. The reactions appear to be first order with respect to aromatics and zero order for steam. Steam/carbon ratio does not appear to influence the steam-reforming reaction, provided the ratio is above the ratio for carbon formation. The results of this work show that catalysts can play a key role in the reactions of coal with steam. Blank runs with benzene showed that temperatures above 900°C are necessary for thermal steam reforming. With catalysts this reaction begins at 450°C. If some inexpensive route can be found to liquify coal, then with catalysts, it may be possible to achieve that long desired reaction: a one-step route to methane from coal and steam at low temperatures where this reaction is favored. 10 figures.

32491 (DOE/METC—84-8, pp 408-409) **Single stage catalytic gasification of coal to high-Btu gas.** Wiser, W.H. Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The usual procedure for converting coal to a high-Btu gas involves, as a first step, the reaction of coal with steam and oxygen, thereby oxidizing much of the carbon to CO. Energy equivalent, up to one-third of the heating value of the coal, is consumed in maintaining the system temperature (usually above 950°C) and sustaining the endothermic steam-carbon reaction. The subsequent water-gas shift reaction ($T < 400°C$) and reduction of a substantial portion of the CO to CH_4 ($T \sim 430°C$) are exothermic but cannot be used to support the steam-carbon reaction at a much higher temperature. This research follows an alternate path of further reducing the carbon in the coal to C_1-C_4 hydrocarbons by catalytically adding hydrogen while avoiding oxidation of carbon to CO. Temperatures are in the range 450° to 500°C, pressures 1000 to 1200 psig, and contact time 6 to 30 minutes. It has been demonstrated that appropriate selection of catalysts can dramatically affect the hydrocarbon product. It is not desirable to reveal the composition or specific types of activity of the catalysts until the patent position has been more fully define. Catalyst A was selected to maximize the yield of methane in the product. Catalyst B was selected to maximize the yield of C_3-C_4 hydrocarbons with sufficient liquids production to operate in solvent balance. Typical experimental results for these catalysts are presented.

32492 **(DOE/METC/SP—206) Underground coal gasification in the bituminous coal resource.** (USDOE Morgantown Energy Technology Center, WV). Mar 1984. 26p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84003082.

The goal of the US Department of Energy (DOE) Underground Coal Conversion Program is to develop technology to produce clean fuels from coal deposits that are unsuitable for commercial mining. DOE's strategy is to remove the high-risk elements of UCG by resolving technical, environmental, and economic uncertainties. This will enable industry to assume responsibility for commercialization of the technology. Thus, the elements of the program have been designed to: provide detailed design and operational data that industry can use to scale-up with confidence; provide accurate and complete cost estimates that will allow comparison between alternative processes; provide detailed environmental impact and control data to allow industry to implement projects that will meet applicable standards; verify the reliability of continuous operation of UCG processes; and show that UCG processes have the flexibility to meet a variety of commercial needs. The Underground Coal Conversion Program has successfully demonstrated the technical feasibility of UCG for subbituminous coals through a series of 13 federally sponsored UCG field tests. These tests have demonstrated both air and steam-oxygen injection, reverse combustion and directional borehole drilling to link process wells, and continuous operation for sufficiently long time periods (30 to 60 days) at high enough gasification rates (30 to 100 tons per day) to provide a good technical data base. A number of mathematical models have been developed and compared with field results to provide predictive capability. The need for extensive pre-operational site characterization has been demonstrated. 72 references, 5 figures.

32493 **(DOE/OR/03054—12) Final environmental impact statement/baseline design reconciliation. Final technical report.** (International Coal Refining Co., Allentown, PA (USA)). Feb 1983. Contract AC05-78OR03054. 83p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84013163.

The Final Environmental Impact Statement (FEIS) for the SRC-I Demonstration Plant, published in July 1981, was based on preliminary design information available at that time. After the FEIS was published, the design continued to be revised and updated, and it evolved into a more detailed Baseline Design, which was published in March 1982. This design was subsequently upgraded by means of numerous Engineering Change Proposals (ECPs). Evolution of the Baseline Design and ECPs involved many changes that were environmentally significant. This report was prepared to highlight major changes made since the FEIS was published, and to provide a foundation upon which future updating could be based. No attempt has been made to revise the FEIS, or to provide a quantitative update of its environmental analyses. Where possible, estimates of the direction and magnitude of the changes are provided and outstanding issues that require further study are enumerated. In general, although the environmental impacts of the current SRC-I plant design differ from those in the FEIS, the releases remain well below applicable standards and comparable coal power plant

releases. FEIS worst-case analyses still encompass the potential impacts of the current design.

32494 **(DOE/OR/03054—20) Internal R and D task summary report: large-scale dissolver cold-flow modeling.** Moujaes, S.F. (International Coal Refining Co., Allentown, PA (USA)). Jun 1984. Contract AC05-78OR03054. 127p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013974.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Cold-flow simulation of the SRC-I dissolvers has been performed on three columns with different height-to-diameter ratios to provide a better understanding of the fluid dynamics and operation of a three-phase gas/liquid/solid system. The experiments were conducted in 5-in.-, 12-in.-, and 6-ft-diameter columns. The effects of various parameters on gas holdup, liquid axial dispersion coefficients, solids axial distribution, and gas/liquid mass-transfer coefficients were investigated. In general, ICRC found that flow conditions such as superficial gas and liquid velocities, physical properties of the liquid such as surface tension and viscosity, and the solids loading and particle size could dramatically affect column performance by affecting gas holdup, axial liquid dispersion, gas/liquid mass-transfer coefficients, and solids distribution. This, in turn, could affect scale-up of the dissolver to demonstration plant size. 11 references, 64 figures, 14 tables.

32495 **(DOE/OR/03054—24) Revised integration documentation.** (International Coal Refining Co., Allentown, PA (USA)). Jun 1983. Contract AC05-78OR03054. 108p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013521.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Process streams and utilities interface information from the Design Baselines were compared to identify any inconsistencies that could: jeopardize process integrity; interfere with plant operability; or significantly impact the baseline cost estimates. The attached document compiles the process and utilities interface information contained in revised baselines developed by each area contractor as of December 1982 and points out discrepancies. With few exceptions, the interface discrepancies were attributable to project information upgrading inherent in the baselining effort itself. There were two major sources for discrepancy between baselines. First, essentially all baseline work was started simultaneously. Each area contractor began baselining with preliminary estimates of the requirements of the other areas. Further, start-up, shutdown, and slipstream requirements identified during baseline and P and ID development could not always be worked into the baseline of all affected areas. The second major source of discrepancies stemmed from uncertainty in technical definition at the start of baselining efforts. Most of these items have been addressed now as ECP's but understandably, they were sources of baselining inconsistencies. Two qualifications must be recognized. First, the interconnecting piping systems have not been optimized. Final line sizing will be determined during the detailed design phase of the project. To check baseline consistency, only the bases for design can be compared. The second qualification is that the utility systems must be considered preliminary. Most utility systems will undergo one or more iterations before a final optimized system is developed. While the utility distribution system can be significantly altered, the major equipment is not expected to be greatly affected by future optimization. 7 figures, 17 tables.

32496 **(DOE/OR/03054—25) Summary material balances for the 6000-TPD SRC-I Demonstration Plant.** (International Coal Refining Co., Allentown, PA (USA)). Jul 1983. Contract AC05-78OR03054. 52p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013782.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Terminal stream material balances for individual process areas of the 6000-tpd SRC-I Demonstration Plant have been developed. Based on these, overall plant summary material balances were compiled for the two normal operation cases, i.e., expanded-bed hydrocracker (EBH) at high conversion and EBH at low conversion. The summary balances, presented in this report, cover all streams in and out of each process unit, including utility, waste, and vent streams. Also, stream properties such as pressure, temperature, standard cubic feet per minute (scfm), gallons per minute (gpm), actual cubic feet per minute (acfm), molecular weight, density, and viscosity have been estimated. The terminal stream balances developed for individual process areas are based on information contained in Design Baselines as of December 1982. Numerous interface stream discrepancies exist among the individual area Design Baselines. Essentially all the Baseline design work was started simultaneously. Each Area Contractor began preparing his Baseline with preliminary estimates of the requirements for other areas. Furthermore, a given contractor could not take advantage of refinements in material balances made by the other contractors throughout the Baseline design period. Also, start-up, shutdown, and slipstream requirements that were identified during development of the Baseline and piping and instrument diagrams (P & IDs) could not always be worked into the Baselines of all affected areas. However, the attached summary balances have been developed on a consistent basis. All interface discrepancies have been corrected by appropriate stream adjustments to yield converged sets of material balances. Differences between these balances and the baseline are judged to be insignificant and to have negligible impact on the process design, cost or operability of the facility.

32497 **(DOE/OR/03054—29) Effects of accumulated solids and solvent initial boiling point on dissolver performance. Final technical report.** Skinner, R.W. (International Coal Refining Co., Allentown, PA (USA)). Sep 1983. Contract AC05-78OR03054. 166p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84013645.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Recycling mineral-rich solid residues (filter cake and Kerr-McGee ash concentrate) to the dissolver of an SRC-I coal liquefaction process is beneficial. Recycling increases the combined yield of oils plus asphaltenes, and decreases the preasphaltene yield, without increasing the hydrocarbon gas yield, without increasing the hydrocarbon gas yield. Filter cake catalyzes the preasphaltenes conversion and solvent hydrogenation reactions, indicating that dissolver solids are catalytically active. 12 references, 39 figures, 39 tables.

32498 **(DOE/OR/03054—30) Steam/fuel system optimization report: 6000-tpd SRC-I Demonstration Plant.** Vakil, T.D. (International Coal Refining Co., Allentown, PA (USA)). Jul 1983. Contract AC05-78OR03054. 88p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013522.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The design and configuration of the steam and fuel system for the 6000-ton-per-day (tpd) SRC-I Demonstration plant have been optimized, based on requirements for each area of the plant that were detailed in Area Baseline Designs of December 1982. The system was optimized primarily for the two most likely modes of plant operation, that is, when the expanded-bed hydrocracker (EBH) is operating at either high or low conversion, with all other units operating. However, the design, as such, is also operable under four other anticipated operating modes. The plant is self-sufficient in fuel except when the coker/calciner unit is not operating; then the required fuel oil import ranges from 80 to 125 MM Btu/h, lower heating value (LHV). The system affords stable operation under varying fuel gas availability and is reliable, flexible, and efficient. The optimization was based on maximizing overall efficiency of the steam system. The system was optimized to operate at five different steam-pressure levels, which are justifiable based on the plant's team requirements for process, heat duty, and power. All identified critical equipment drives will be run by steam turbines Also part of the optimization was elimination of the steam evaporator in the wastewater treatment area. This minimized the impact on the steam system of operating in either the discharge of zero-discharge mode; the steam system remains essentially the same for either mode. Any further optimization efforts should be based on overall cost-effectiveness.

32499 **(DOE/OR/03054—31) Hydroprocessing SRC. Final technical report.** Bronfenbrenner, J.C.; Garg, D.; Harris, C.F.; Znaimer, S. (International Coal Refining Co., Allentown, PA (USA)). Sep 1983. Contract AC05-78OR03054. 84p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84014151.

Catalyst activity and aging rate were studied in ICRC's process development unit (PDU) and at the Wilsonville Advanced Coal Liquefaction Facility under SRC-I Demonstration Plant hydroprocessing conditions. Similar studies using both high- and low-conversion modes were conducted by The Lummus Company. The studies determined variations in SRC conversion, hydrocarbon gas production, hydrogen consumption, and heteroatom removal. Samples of spent catalyst were analyzed to ascertain the reasons for catalyst deactivation. Finally, the ICRC PDU hydroprocessing results were compared with those generated at Lummus and Wilsonville pilot plants.

32500 **(DOE/OR/03054—32) Slurry fired heater cold-flow modelling.** Moujaes, S.F. (International Coal Refining Co., Allentown, PA (USA)). Jul 1983. Contract AC05-78OR03054. 198p. NTIS, PC A09/MF A01; 1: GPO Dep. Order Number DE84013791.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report summarizes the experimental and theoretical work leading to the scale-up of the SRC-I Demonstration Plant slurry fired heater. The scale-up involved a theoretical model using empirical relations in the derivation, and employed variables such as flow conditions, liquid viscosity, and slug frequency. Such variables have been shown to affect the heat transfer characteristics ofthe system. The model assumes that, if all other variables remain constant, the heat transfer coefficient can be scaled up proportional to D/sup -2/3/ (D = inside diameter of the fired heater tube). All flow conditions, liquid viscosities, and pipe inclinations relevant to the demonstration plant have indicated a slug flow regime in the slurry fired heater. The annular and stratified flow regimes should be avoided to minimize the potential for excessive pipe erosion and to decrease temperature gradients along the pipe cross section leading to coking and thermal stresses, respectively. Cold-flow studies in 3- and 6.75-in.-inside-diameter (ID) pipes were conducted to determine the effect of scale-up on flow regime, slug frequency, and slug dimensions. The developed model assumes that conduction heat transfer occurs through the liquid film surrounding the gas slug and laminar convective heat transfer to the liquid slug. A weighted average of these two heat transfer mechanisms gives a value for the average pipe heat transfer coefficient. The cold-flow work showed a decrease in the observed slug frequency between the 3- and 6.75-ID pipes. Data on the ratio of gas to liquid slug length in the 6.75-in. pipe are not yet complete, but are expected to yield generally lower values than those obtained in the 3-in. pipe; this will probably affect the scale-up to demonstration plant conditions. 5 references, 15 figures, 7 tables.

32501 **(DOE/OR/03054—49) Evaluation of effects of phenol recovery on biooxidation and tertiary treatment of SRC-I wastewater. Final technical report.** Mitchell, J.W.; Watt, J.C.; Cowan, W.F.; Schuyler, S.E. (Catalytic, Inc., Philadelphia, PA (USA)). Sep 1983. Contract AC05-78OR03054. 381p. NTIS, PC A17/MF A01; 1; GPO Dep. Order Number DE84013973.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Addition of phenol recovery to the wastewater treatment scheme in the Baseline Design for the SRC-I Demonstration Plant was evaluated as a major post-Baseline effort. Phenol recovery affects many downstream processes, but this study was designed to assess primarily its effects on biooxidation and subsequent tertiary treatment. Two parallel treatment schemes were set up, one to treat dephenolated wastewaters and the other for processed nondephenolated wastewaters, a simulation of the Baseline Design. The study focused on comparisons of five areas: effluent quality; system stability; the need for continuous, high-dose powdered activated carbon (PAC) augmentation to the bioreactor; minimum bioreactor hydraulic residence time (HRT); and tertiary treatment requirements. The results show that phenol recovery improves the quality of the bioreactor effluent in terms of residual organics and color. With phenol recovery, PAC augmentation is not required; without phenol recovery, PAC is needed to produce a comparable effluent. Dephenolization also enhances the stability of biooxidation, and reduces the minimum HRT required. With tertiary treatment, both schemes can meet the effluent concentrations published in the SRC-I Final Enviornmental Impact Statement, as well as the anticipated effluent limits. However, phenol recovery does provide a wider safety margin and could eliminate the need for some of the tertiary treatment steps. Based solely on the technical merits observed in this study, phenol recovery is recommended. The final selection should, however, also consider economic tradeoffs and results of other studies such as toxicology testing of the effluents. 34 references, 30 figures and 26 tables.

32502 **(DOE/OR/03054—50-App.A-Vol.2) Interim report on the genetic and animal toxicity testing of SRC-I products, intermediates, and waste materials. Appendix A. Volume 2. Microbial mutagenicity evaluations (Ames test) option IA reports.** Drozdowicz, B.Z.; Kelly, C.M. (International Coal Refining Co., Allentown, PA (USA)). Sep 1983. Contract AC05-78OR03054. 251p. NTIS, PC A12/MF A01; GPO Dep. Order Number DE84013325.

SRI International examined ICRC's 14 samples (SRC Middle Distillate, SRC solid (aqueous and saline suspensions and concentrate of water extract), extract and suspension of Kerr-McGee residue, etc.) for mutagenic activity in the standard Ames Salmonella/microsome in vitro mutagenicity assay using strains of Salmonella typhimurium. All assays were performed in the presence and absence of a rat-liver metabolic activation system. Testing was conducted in compliance with the provisions of the United States Food and Drug Administration Good Laboratory Practice (GLP) Regulations. The results are summarized in the base report.

32503 **(DOE/OR/03054—50-App.B-Vol.2) Interim report on the genetic and animal toxicity testing of SRC-I products, intermediates, and waste materials. Appendix B. Vol. 2.** Drozdowicz, B.Z.; Kelly, C.M. (International Coal Refining Co., Allentown, PA (USA)). Sep 1983. Contract AC05-78OR03054. 279p. NTIS, PC A13/MF A01; 1; GPO Dep. Order Number DE84013327.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

SRC International examined SRC products listed (10 items) for mutagenic activity at the thymidine kinase locus in L5178Y mouse lymphoma cells in the absence and presence of a metabolic activation system. For a concise summary of the results see the abstract of the main report. (LTN)

32504 **(DOE/OR/03054—52) Corrosion of fractionation towers in coal liquefaction plants.** Bagga, P.S.; Harris, C.F.; Baumert, K.L. (Air Products and Chemicals, Inc., Allentown, PA (USA)). Sep 1983. Contract AC05-78OR03054. 38p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013371.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Severe corrosion has been observed in the fractionating towers at the Wilsonville, Alabama Advanced Coal Liquefaction Facility and at the Ft. Lewis, Washington Pilot Plant. At Wilsonville, the high corrosion rate of carbon and of types 304 and 316 stainless steel occurred when the facility was processing coal with 0.15 to 0.39 wt % chloride. This corrosion was most severe in the 440 to 485°F (225 to 250°C) boiling range. The analysis of scale on coupons immersed in the tower showed a high concentration of water-soluble chloride. The analysis of organic compounds in the tower liquids revealed a large amount of acid fractions like phenols and cresols, and basic fractions like aniline. During lab experiments with liquids rich in chlorides and acid and basic fractions, a high corrosion rate was observed. Absence of one or more of these fractions resulted in negligible corrosion. Based on these observations, it is concluded that when water-soluble chlorides, basic nitrogen compounds (basic fractions), and phenols (acid fractions) are simultaneously present in the coal liquids, they exhibit a synergism that results in high corrosivity. In order to reduce the corrosion to acceptable levels, it is recommended that 904L and 317 stainless steel be used as the material of construction for the fractionation tower.

It is also recommended that a chloride removal scheme be employed; the scheme would combine removal of chlorides before they reach the tower and a small side draw from the tower. 14 references, 11 figures, 8 tables.

32505 **(DOE/OR/03054—55) RO feed pretreatment and flat cell tests for SRC-I wastewater.** Watt, J.C.; Cahill, C.J.; Cowan, W.F.; Schwoyer, W.K.L. (Catalytic, Inc., Philadelphia, PA (USA); International Coal Refining Co., Allentown, PA (USA)). Mar 1984. Contract AC05-78OR03054. 172p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84014061.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

To assess the feasibility of reverse osmosis (RO) in the SRC-I Demonstration Plant, Catalytic, Inc. conducted tests on biologically treated wastewaters generated during other studies. The efficacy of the post-bio-oxidation treatment steps, including tar acid precipitation, filtration, softening, carbon adsorption, and ozonation, was first evaluated to determine if these steps met the requirements recommended by RO membrane manufacturers. The pretreated wastewaters were then used to run 400-h RO flat cell tests. As a secondary objective, the studies were conducted to generate samples for toxicology testing, since the treated wastewaters might at times be discharged into the river. 12 references, 50 figures, 20 tables.

32506 **(DOE/OR/03054—58) Full-scale cold-flow modelling of the SRC-I slurry fired heater at Creare, Inc.** Mehta, D.C. (International Coal Refining Co., Allentown, PA (USA)). Sep 1983. Contract AC05-78OR03054. 187p. NTIS, PC A09/MF A01; 1; GPO Dep. Order Number DE84013792.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The slurry fired heater is a crucial piece of equipment in the SRC-I Demonstration Plant. The design of the fired heater has not been tested in any other plant under a similar combination of operating severity and multiphase flow. The cold-flow modelling experiments were conducted to confirm the fired heater design and to develop acceptable boundaries of flow rates for proper operation of the fired heater. The primary objectives were to identify the flow regimes, estimate pressure drops and measure heat transfer coefficients at a variety of fired heater operating conditions. The results definitively confirm the presence of a slug flow regime in the fired heater at the full range of operating conditions. Slug flow is desirable to avoid coking and excessive temperature gradients in the heater pipes and because of its relatively low pressure drop. The gas holdup predictions by the Hughmark correlation were in good agreement with the experimental results. A simplified correlation was developed to calculate gas holdup in the SRC-I fired heater pipes. The pressure drop results also confirmed that the experimental values were less than the design values. The Hughmark correlation was able to predict the pressure drop for the viscous fluids within +-20% of the measured value. The heat transfer coefficients calculated from the experiments were almost twice as high as those used in the design of the fired heater. The tests were successful based on the data developed, and the results confirm the fired heater design and indicate flexibilities in its operation.

32507 **(DOE/OR/03054—62) Liquid product characterization and compatibility studies. Final technical report.** Skinner, R.W.; Cusick, R.C.; Stawasz, W.W.; Tiedge, W.F. (International Coal Refining Co., Allentown, PA (USA); Air Products and Chemicals, Inc., Allentown, PA (USA)). Feb 1984. Contract AC05-78OR03054. 134p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013976.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This program measured the physical and chemical properties of the proposed product liquids from the SRC-I Demonstration Plant, and of their constituent streams from the first stage, hydrocracker, and coker. The liquids' storage stability and the compatibility of demonstration plant product liquids with No. 2 and No. 6 fuel oils were also determined. The analytical results were compared with ASTM fuel specifications and interpreted in terms of preferred end-use applications and upgrading requirements for the SRC-I product liquids. The program also evaluated a range of analytical procedures to determine their suitability for characterizing coal-derived fuels. SRC-I middle distillate has reasonably good storage stability but is not compatible with No. 2 fuel oil. It should be able to displace No. 2 oil in certain dedicated-use industrial boilers, even though it does not meet all the ASTM specifications. SRC-I heavy distillate has fair/poor storage stability, but is fairly compatible with No. 6 fuel oil. No stability enhancing additives have been tested. Although it cannot meet all the ASTM No. 6 oil specifications, it should be acceptable for dedicated-use industrial boilers. Combined SRC-I heavy and middle distillates are a good cutter stock for reducing the viscosity of petroleum vacuum residuum to meet the No. 6 fuel oil specifications. 12 references, 40 tables.

32508 **(DOE/OR/03054—91) Comparative toxicity of SRC-I wastewater to aquatic organisms. Final technical report.** Bailey, H.C. (SRI International, Menlo Park, CA (USA)). Jan 1984. Contract AC05-78OR03054. 57p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013977.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

SRI International performed a series of acute and chronic toxicity studies on SRC-I wastewaters using fish, zooplankton, and algae as test organisms. The tests were designed to determine the toxicity of SRC-I wastewaters to quatic organisms and based on differences in toxicity of the various water samples, to evaluate the efficacy of various wastewater treatment methods. Survival data from acute and chronic daphnid studies indicate that phenol recovery markedly reduced wastewater toxicity. In treatment processes that did not include phenol recovery, powdered activated carbon reduced toxicity more effectively than granulated activated carbon. All treated water supported algal growth in excess of that in controls, particularly those waters subjected to phenol recovery. The toxicity of each SRC-I wastewater sample was compared with that of a corresponding synthetic salt solution to determine whether the salt load was the toxic element. The wastewaters typically exhibited higher toxicity than their associated salt solutions. The effect was greatest in the daphnid chronic studies. The aquatic ecotoxicity tests were performed as part of ICRC's post-Base-line environmental R & D program. One objective of the program was to evaluate the impact of phenol recovery on effluent quality. Another objective was to assess the potential impact of wastewater discharge on aquatic organisms. The results of this study have been integrated with results from the rest of the R & D program, and are documented in ICRC's Integration Report for SRC-I Post-Baseline Environmental R & D. 7 references, 10 figures and 22 tables.

32509 **(DOE/OR/03054—96-Vol.1) Subcontracted R and D final report: SRC-I phase equilibrium and enthalpy data for coal liquefaction and solvent recovery areas. Volume 1.** Mehta, D.C.; Chu, I.C. (International Coal Refining Co., Allentown, PA (USA)). Mar 1984. Contract AC05-78OR03054. 129p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84014117.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

International Coal Refining Company instituted a 2-year program to develop new data on SRC-I coal liquids and related model compounds. Specifically, the overall program obtectives were to develop vapor/liquid equilibrium (VLE) and enthalpy data to modify the existing petroleum-based correlations and verify the designs of several pieces of process equipment in the SRC-I Demonstration Plant. The analytical characterization of coal liquid samples was performed by Air Products and Chemicals, Inc. The VLE program was subcontracted to Chromaspec Corporation and the enthalpy data were developed by Colorado School of Mines. 6 references, 19 figures, 30 tables.

32510 **(DOE/OR/03054—96-Vol.2) Subcontracted R and D final report: SRC-I phase equilibrium and enthalpy data for coal liquefaction and solvent recovery areas. Volume 2.** Mehta, D.C.; Chu, I.C. (International Coal Refining Co., Allentown, PA (USA)). Mar 1984. Contract AC05-78OR03054. 137p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84014118.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Vapor-liquid equilibrium measurements were taken for coal liquids in contact with various pre-mixed gases consisting mostly of H_2, N_2, CO, H_2S, and light hydrocarbons, as well as coal liquids in contact with H_2 and ethane mixtures to simulate SRC-I Demonstration Plant. Additionally, vapor-liquid equilibrium measurements were performed with hydrogen in contact with various pure components for correlation purposes. Temperatures ranged from 115°F to 840°F and pressures ranged from 40 psia to 2000 psia. The vapor-liquid equilibrium data obtained in this task will permit checks of the process design conditions in the hydrogen recovery section of the SRC-I Demonstration Plant and will be used in simulation studies at different processing conditions. The phase equilibrium program consists of process check points, correlation check points, and hydrogen and liquid-component K-values. The hydrogen K-values are to be used in determinations of losses and feed compositions to the Demonstration Plant's Hydrogen Purification Unit, while the methane, ethane, and propane K-values will be used in calculations involving auto-refrigeration in the same units. Water K-values and the distribution of water between the organic and aqueous phases will be used to determine water flow rates and water loading in the process solvent column. The K-values of the heavy components are to be used to determine equipment sizes and loading in the hydrogen recovery section. 50 figures, 51 tables.

32511 **(DOE/OR/03054—96-Vol.3) Subcontracted R & D final report: SRC-I phase equilibrium and enthalpy data for coal liquefaction and solvent recovery areas. Vol. 3.** Mehta, D.C.; Chu, I.C.; Kidnay, A.J.; Yesavage, V.F. (International Coal Refining Co., Allentown, PA (USA); Colorado School of Mines, Golden (USA). Dept. of Chemical and Petroleum Refining Engineering). Mar 1984. Contract AC05-78OR03054. 259p. NTIS, PC A12/MF A01; 1; GPO Dep. Order Number DE84014119.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The Enthalpy Program was a 20-month project initiated on January 18, 1982 by the International Coal Refining Company (ICRC) and under the technical direction of Professor Arthur J. Kidnay and Professor V.F. Yesavage at the Colorado School of Mines (CSM), Golden, Colorado. The objective of the program was to gather enthalpy data on representative pure model compounds, mixtures of model compounds, and selected coal-derived liquid samples furnished by ICRC. A copy of the technical agreement between ICRC and CSM is included in this report as Appendix A. This final report contains a complete description of the calorimeter and the experimental procedures used, separate data sections for each experimental task, and a copy of the technical agreement between ICRC and CSM. Data are presented for 11 coal liquid fractions. Each section of this report is organized to stand alone; thus, there are no general lists of references, tables of notation, or overall data tables.

32512 **(DOE/OR/03054—100) Extension of the evaluation of reverse osmosis for SRC-I wastewater. Final technical report.** (Catalytic, Inc., Philadelphia, PA (USA)). Jun 1984. Contract AC05-78OR03054. 72p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013634.

Reverse osmosis (R.O.) is an integral part of the zero discharge option for the proposed SRC-I Demonstration Plant. The original laboratory treatability testing program for reverse osmosis failed to demonstrate the technical feasibility of this process, due to problems with membrane fouling and deterioration. In that study (1), a high pressure (800 psi) polyether urea membrane for sea water and a low pressure (400 psi) cellulose diacetate membrane for brackish water failed to maintain reasonable TDS rejection rates during flat cell tests. The problem was particularly severe for the high pressure membrane. At the end of the original study, testing was continued on two additional low pressure membranes. One of these was a cellulose diacetate triacetate blend. The other was a new polyaramid membrane, which had only recently become commercially available. This report documents the results of all of the reverse osmosis laboratory tests. The wastewaters used in this study were effluents from bench scale, two-stage bioreactors, followed by tertiary treatment consisting of coagulation, softening, filtration, and granular activated carbon. The investigative program consisted of both immersion and flat cell tests. The results show tht the SRC-I wastewaters are difficult to treat by reverse osmosis with polyether urea or cellulose acetate membranes, and membrane failure was common. However, the new polyaramid membrane was found to be satisfactory when tested with a dephenolated feed stream. After over 1500 hours of continuous flat cell testing, it exhibited a TDS rejection rate of 95%. Based on these preliminary results, reverse osmosis does appear to be a technically feasible approach to achieve zero discharge, assuming the feed stream is dephenolated.

32513 **(DOE/OR/03054—101) Evaluation of thickening and dewatering characteristics of SRC-I wastewater treatment sludges. Final technical report.** (Catalytic, Inc., Philadelphia, PA (USA)). May 1984. Contract AC05-78OR03054. 131p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013560.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The SRC-I Demonstration Plant in Newman, Kentucky, will generate several different sludges as a result of providing extensive wastewater treatment. Because construction of this plant has been postponed indefinitely, there has been an opportunity to generate additional data pertinent to waste treatment. Accordingly, this report presents the results of a study on the thickening and dewatering characteristics of several of the wastewater treatment sludges. The study included: evaluation of chemical conditioning agents; aerobic digestion of biological sludges; gravity thickening; and the relative effectiveness of dewatering by centrifuge, vacuum filter, belt filter, and pressure filter. Sludges were tested individually and in combination. The results indicated that the biological sludge could be best dewatered by pressure filtration. The chemical sludges should be combined prior to dewatering, which should be provided by a belt filter. The tar acid sludge will be kept separate, due to its low pH, and ultimate disposal will be by incineration. The tar acid sludge was more concentrated than had been expected. As a result, thickening, rather than centrifuging, is the recommended treatment for this sludge. All sludges were tested for leachate toxicity by the extraction procedure method. The results were negative, indicating the sludges are non-hazardous in heavy metal concentrations, according to RCRA classification. The test results have identified design changes for the proposed wastewater treatment facilities.

32514 **(DOE/OR/03054—107) Biokinetic study for SRC-I wastewater.** (Catalytic, Inc., Philadelphia, PA (USA)). Jun 1984. Contract AC05-78OR03054. 177p. NTIS, PC A09/MF A01; 1; GPO Dep. Order Number DE84013780.

Biooxidation is an important part of the overall wastewater treatment system for the proposed SRC-I Demonstration Plant in Newman, Kentucky. After the completion of a Baseline Design for the plant in April 1982, various refinements were evaluated. One of these was the inclusion of a process for phenol recovery from four sour-water streams. As part of this evaluation, an extensive laboratory treatability study was conducted on wastewaters both with and without this phenol recovery step. The purpose of the study was to compare the results of different treatment schemes on different wastewaters and did not include the development of the kinetic coefficients that govern the biooxidation process. Additional treatability testing documented herein, has been performed to establish the kinetic coefficients for biooxidation of the SRC-I wastewaters. This will provide a rational basis for any subsequent changes in design. The wastewater feed used in this study was process recycle water from the Fort Lewis, Washington, pilot plant. Prior to biooxidation, it was pretreated by solvent extraction for removal of phenolics and by steam stripping for removal of ammonia and hy-

drogen sulfide. Two, 2-stage bench scale bioreactors were operated for approximately eight months, during which time they were stabilized at various steady-state conditions. Kinetic coefficients were evaluated according to the Lawrence and McCarty model, based on BOD, COD, and TOC. Nitrification, oxygen utilization, and solids settling velocities were also studied. The results showed that BOD is a poor basis for the model mainly because almost all BOD_5 was removed at all steady-state conditions. Also, the model was more accurate for steady-state conditions of lower solids retention times. The bulk of both organic and ammonia reductions occurred in the first stage reactors.

32515 **(DOE/PC/30217—T5) Pyrolysis of coal-derived fuels using the laser-powered homogeneous pyrolysis technique.** de Boer, P.C.T. (Cornell Univ., Ithaca, NY (USA). Sibley School of Mechanical and Aerospace Engineering). Mar 1984. Contract FG22-80PC30217. 57p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84012798.

Portions are illegible in microfiche products.

Detailed results are presented on the application of the Laser-Powered Homogeneous Pyrolysis Technique to hydrocarbon species. Measurements of the mean reaction temperature of the sample cell in the range 580 to 890°K were made with a chemical thermometer, using various unimolecular reactions with known rate constants. The results agree quite well with the temperature at mid-height on the centerline of the cell, as measured with a thermocouple. A set of equations was developed describing the motion and the temperature field of the strongly heated gas in the sample cell. These equations follow from the exact equations of fluid dynamics by using formal perturbation theory, with the nondimensionalized depth of the fluid as the only small parameter. Numerical solution of these equations by computer is no more complex than solution of the Boussinesq approximate equations used by previous investigators. Detailed computer solutions are obtained for a number of cases, and the results are compared with results based on the Boussinesq equations. The two sets of results differ significantly, especially for cases where much of the laser power is absorbed near the bottom of the sample cell. The agreement between computed and measured values is very good at temperatures up to about 800°K, and reasonably good at temperatures in the range 800 to 1200°K. Detailed results are reported on the homogeneous pyrolysis of toluene in the temperature range 940 to 1190°K. The decomposition rate measured agrees with that reported by previous investigators. Major product species observed are benzene and methane; additional products are ethylene, acetylene and ethane. It is concluded that the Laser-Powered Homogeneous Pyrolysis Technique can provide useful information on pyrolysis products of hydrocarbons at low to moderate temperatures.

32516 **(DOE/PC/50001—15) Advanced coal liquefaction research. Quarterly technical progress report, January 1-March 31, 1983.** (Gulf Research and Development Co., Shawnee Mission, KS (USA)). Dec 1983. Contract AC22-82PC50001. 206p. NTIS, PC A10/MF A01; 1; GPO Dep. Order Number DE84004074.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report describes progress on the Advanced Coal Liquefaction project by the Gulf Research and Development Company's Merriam Laboratory during the months of January through March 1983. The liquefaction behavior of Illinois No. 6 coal beneficiated in various ways was studied in both single-stage recycle (SRC II) and short contact time (SCT) modes of operation. The distillate yield increased as the iron level in the feed slurry increased in both modes of operation. In the SCT mode, the conversion increased at greater depths of cleaning. In the SRC II mode, the distillate yield and conversion were much higher with deep cleaning and add-back of pyrite than with conventional cleaning. Pyrite addition resulted in a significant increase in short contact time conversion of subbituminous Belle Ayr coal in both high and low quality solvents. Solvent quality itself, however, had little effect on conversion. With Loveridge coal, the hydrocarbon gas yield and conversion decreased as the residence time was reduced in the range of 3 to 8 minutes. The bottoms product was filterable only at residence times of 6 minutes or greater. Addition of a small amount of nickel to a molybdenum emulsion catalyst improved yields slightly with Belle Ayr coal in the SRC II mode. Higher levels of nickel resulted in the same oil yield as with none at all.

32517 **(DOE/PC/50041—37) Wilsonville Advanced Coal Liquefaction Research and Development Facility technical progress report. Run 244 with Illinois 6 coal.** (Catalytic, Inc., Wilsonville, AL (USA)). May 1984. Contract AC22-82PC50041. 145p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013174.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report presents the operating results for Run 244 at the Advanced Coal Liquefaction R and D Facility in Wilsonville, Alabama. This run was made in an all-distillate Integrated Two-Stage Liquefaction (ITSL) mode using Illinois 6 coal from the Burning Star mine. The primary objective was to demonstrate the effects of temperature programming an aged catalyst batch on the ITSL product slate, especially on the net C_1-C_6 gas production and hydrogen consumption. Other objectives were to demonstrate the effect of fresh catalyst addition and to age the catalyst batch for an extended run with catalyst addition and withdrawal. Run 244 began on 4 July 1983 and continued through 27 September 1983. During this period, 182.9 tons of coal was fed in 1872 hours of operation. Seven special product workup material balances and two hydrotreater balances were defined, and the results are presented herein. From 27 to 30 September, 7.4 tons of Wyodak (Clovis Point mine) subbituminous coal was fed in 79.2 hr. This special test was performed to determine TL unit and CSD unit operability and to obtain design information for coal slurry drying. Preliminary results of a run with subbituminous coal are presented herein. 4 references, 29 figures, 20 tables.

32518 **(DOE/PC/50051—T4) Development of a reference data system for the liquefaction technology data base. Final technical report, 22 September 1982-3 August 1983.** Gallier, P.W.; Boston, J.F.; Wu, P.C.; Yoon, E.S. (Aspen Technology, Inc., Cambridge, MA (USA)). 31 Jan 1983. Contract AC22-82PC50051. 165p. NTIS, PC A08/MF A01. Order Number DE84004620.

The overall objective of this project is to create a prototype reference data system, built around the ASPEN process simulation system, which will include those thermophysical properties of coal liquids necessary to calculate vapor-liquid equilibrium (VLE) and perform heat and material balance (HMB) calculations. An important emphasis of the project is applicability to coal liquids from the SRC-II process. The properties that are most often needed for VLE and HMB calculations are K-values, enthalpies and densities of both vapor and liquid mixtures. Vapor and liquid enthalpies are generally expressed in terms of departures from the ideal gas enthalpy at the same temperature. This means that a model is required for the calculation of the ideal gas heat capacities of all components present, and that other models are needed to estimate the departures as functions of temperature, pressure and composition. K-values are generally expressed in terms of liquid and vapor fugacities. Models are therefore also required to estimate these quantities as functions of temperature, pressure and composition. A variety of models and correlations are available for the calculation of the required thermophysical properties in the ASPEN process simulation system. All models and correlations of the types mentioned depend on parameters which are characteristic of the components present in a mixture. For example, the RKS equation of state uses three pure component parameters - critical temperature, critical pressure and acentric factor - and one binary interaction parameter for each pair of components.

32519 **(DOE/PC/50786—7) Arylations of coal model systems.** Smith, B.F.; Venier, C.G.; Squires, T.G. (Iowa State Univ. of Science and Technology, Ames (USA). Energy and Mineral Resources Research Inst.). 1984. Contract FG22-82PC50786. 7p. (CONF-840805—9). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84008848.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

Portions are illegible in microfiche products.

Currently, coal is converted to clean liquids or low melting solids by processes which utilize high temperature, high pressure, or both. These processes occur by thermal bond cleavages and in-

volve the intermediacy of free radicals. In a search for chemistry which could liquefy coal under milder conditions, the authors have focussed on thermally less demanding ionic reactions. Of the functional groups which commonly occur in coals, ethers are the easiest to cleave under acid conditions. Depending on the density of these linkages and their importance as crosslinks in the macromolecular structure of coals, solubilization might be greatly enhanced solely by cleaving and capping either bonds. Benzylic ethers are particularly reactive and have been implicated in the initiation of coal pyrolysis and hydropyrolysis. Arylation, the use of acids to cleave bonds in coals in the presence of aromatic rings to trap the consequent incipient carbonium ions, has a long history. This paper discusses the use of benzyl phenyl ether and l-naphthylmethyl phenyl ether and polymers related to them as models to develop and evaluate the chemistry involved in the arylations. 9 references, 1 figure, 4 tables.

32520 **(DOE/PC/50793—T7) Combined processing of coal and heavy resids. Progress report, January 16, 1984-April 15, 1984.** Curtis, C.W.; Guin, J.A.; Tarrer, A.R. (Auburn Univ., AL (USA)). 1984. Contract FG22-82PC50793. 72p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84012796.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Petroleum crudes and residua and coal have been coprocessed at typical liquefaction conditions in atmospheres of nitrogen and hydrogen and in the presence of hydrogen and a catalyst. At 400°C coal conversion in a nitrogen atmosphere was low and at the same level as the thermal coal reaction with no solvent, indicating that no transfer of hydrogen from the petroleum solvents to the coal occurred. Coal conversion increased in the presence of hydrogen; further increases in coal conversion were observed in the presence of catelyst at 400 to 425°C. The dominant factor of the increased conversion in the majority of the heavy petroleum materials was the presence of the catalyst with the 25° temperature rise being a secondary effect. Oil production from combined processing showed negative or level yields in the N_2 atmosphere, level or slightly positive yields in the H_2 atmosphere and for most petroleum solvents significant increases when a catalyst and hydrogen were both present. As in the case of coal conversion the catalyst appears to be the dominant factor in the increase with temperature having a secondary effect. Individual differences among the petroleum solvents are observed in the product distributions obtained from combined processing. Coal conversion in the H_2 atmosphere appears to be correlated with viscosity, molecular weight and Conradson Carbon number of the petroleum crude. These particular solvent characteristics do not seem as important in coal conversion when a catalyst is present. The parametric evaluation has determined optimal conditions for combined processing. Coal conversion and oil production from combined catalytic (powdered) processing compare favorably with that from tetralin with a powdered catalyst. 11 references, 6 figures, 30 tables.

32521 **(DOE/PC/60046—2) Enhanced coal liquefaction with ammonia and amines in single and binary solvent systems. Second quarterly report, December 20, 1983-March 31, 1984.** Chen, W.Y. (Gulf South Research Inst., New Orleans, LA (USA)). 5 Jun 1984. Contract AC22-83PC60046. 32p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84012288.

Research was extended to study the effects of liquefaction variables on yield structures. Experimental conditions were carefully chosen to examine the effects of temperature, solvent density and reaction time on Illinois No. 6 coal and a Wyodak subbituminous coal. Elemental analysis of a solid sample derived from Illinois No. 6 coal was also performed. While temperature is the most important variable to the amount of ammonia extract, the data also demonstrate the potential significance of using polar nucleophilic compounds in supercritical fluid extraction of coal. First, conversion to ammonia extract increases with increasing NH_3 density. The effect of solvent density on Illinois No. 6 coal is more notable than Wyodak coal. This indicates that the process could involve other limiting factors such as mass transfer and solubility. Second, in comparison with published liquefaction work, ammonia provides higher conversions than other chemically inert, non-polar, non-nucleophilic, supercritical fluids. This intimates the chemical role of nitrogen-containing compounds. Ammonia almost completely removes the sulfur in Illinois No. 6 coal. However, elemental analysis also shows 3.4 nitrogen adduction per 100 gram of coal. 27 references, 7 figures, 4 tables.

32522 **(DOE/PC/60783—2) Study of the kinetics of hydrogenation using aged catalysts. Quarterly technical progress report, 1 October 1983-31 December 1983.** Schweighardt, F.K. (Air Products and Chemicals, Inc., Allentown, PA (USA)). Feb 1984. Contract FG22-83PC60783. 24p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84006588.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Design and construction of the special high pressure autoclave reactor with catalyst basket, unique sample feed and automated sample collection system are in progress by outside contractors. Performance testing of the total reactor system will be delayed 70 days because of construction delays by Autoclave Engineers and relocation of the new high pressure safety cell required special modifications to allow for a safe operation. Chemical reactants (model polynuclear aromatic hydrocarbons) have been selected, ordered and received. Extensive chemical characterization of the reactants is underway to define purity levels. Samples will undergo recrystallization or sublimation to achieve 99.5% single isomer purity. Catalyst material has been received from J. Gough, Manager Wilsonville Coal Liquefaction Facility. Other catalyst material has been defined and requested from H. Schlinder, CE Lummus Company and Wilsonville. A number of reaction solvents for the kinetic study are under evaluation. It is anticipated that at least one perfluorinated solvent (3M Company) will be evaluated in detail under Task 2 (4th quarter FY 1984). We wish to compare and contrast mass transfer effects of hydrogenation in perfluorinated and hydrocarbon (C-16) solvents wih identical catalyst samples.

32523 **(DOE/PC/60793—2) Studies of the stabilization of coal liquids. Quarterly report of progress II.** Davies, G. (Northeastern Univ., Boston, MA (USA). Dept. of Chemistry). 1984. Contract FG22-83PC60793. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84008016.

The nature of inhibition of gum formation and viscosity increase brought about by relatively low levels of the cheap, available additive cyclohexanol has been investigated. The viscosity of fuel C containing progressively larger amounts of cyclohexanol decreases to a very broad minimum at ca. 70% w/w cyclohexanol. Comparison of the infra-red spectra of B, C, GFB2, GFC2 and their respective gums (precipitated with pentane) shows that - OH and -C = N functions are concentrated in the gums, as are the metals (determined by plasma emission spectroscopy). The V/sub OH/ and V/sub C=N/ bands of the fuels are shifted by +- (5 to 15) cm^{-1} on addition of 10% w/w cyclohexanol, again pointing to a physical additive-fuel interaction. Molecular weight measurements for gums (from B and C), GFB2, GFC2, B and C have been measured cryoscopically in nitrobenzene (K/sub f/ 7.0) and cyclohexanol (K/sub f/ 30.7). Gum averages 390 to 420 daltons, while the liquid fuel averages are in the range 300 to 345 daltons in nitrobenzene. Gums are thus precipitated from fuels by hydrocarbons because they are more polar, not because they are of high molecular weight. The measured molecular weights of B and C are lower in cyclohexanol (average 190 to 220 daltons) than in nitrobenzene. The evidence presented thus shows that cyclohexanol acts as a viscosity stabilizer and gum preventative by breaking hydrogen-bond interactions between fuel components, which would otherwise assist fuel oxidation to produce larger molecules and gum, as well by dissolving gum already present in the fuel. Manometric measurements of dioxygen uptake at 25°C on such fuel-cyclohexanol mixtures show that this additive retards the rate of fuel oxidation by dioxygen but measurable rates are still observed.

32524 **(DOE/PC/60808—2) Evaluation of intermolecular attractive forces in coal derived liquids. Quarterly report, February 1984-April 1984.** Jones, M.B. (North Dakota Univ., Grand Forks (USA)). Jun 1984. Contract FG22-83PC60808. 26p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013317.

Quantitative solubility measurements of nine model compounds and seven coal derived preasphaltene samples (four native, three derivatized by acetylation) have been carried out in twelve solvents. Plots of model compound solubility versus solubility parameter exhibited, in general, maxima of ca. 9 to 9.5 H, in agreement with literature results for coal derived asphaltenes. Similar plots for the native preasphaltene samples revealed maxima of ca. 10.5 to 11 H, in accord with reported studies. Little correlation between solubility of model compounds and either net hydrogen bonding indices or donor number minus acceptor number values of solvents was observed. General trends of increasing dissolvability of preasphaltenes with increasing net hydrogen bonding indices or increasing donor number minus acceptor number values of solvents were noted. 13 figures, 5 tables.

32525 **(DOE/PC/61256—T2) Coal conversion processes. Quarterly report, December 13, 1983-March 12, 1984.** Cobb, J.T. Jr.; Biloen, P.; Holder, G.D.; Klinzing, G.E.; Tierney, J.W. (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). May 1984. Contract FG22-83PC61256. 33p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013632.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Experimental work is continuing on four separate projects related to coal conversion processes. The direct digital control of exothermic multiphase reactions is being studied in an experimental adiabatic flow reactor. The existence of two stable steady states for the Fischer-Tropsch reaction network at the same temperature and feed condition has been verified and quantified. Various absorbents for SO_2 and NO/sub X/ are being studied. The absorption of NO_2 by methanol and N-cyclohexyl-2-pyrrolidone has been extensively examined. Preliminary data have been obtained with triethylene-tetraamine. Hindered amines will be studied next. Procedures for the preparation of liquid membranes have been tested and the incorporation of hindered amines in them will now be examined. Isotopic switching is being used to study the way in which promoters affect supported metal catalysts. With improved resolution from the mass spectrometer, early quantitative results give indications of three different surface species and of non-statistical ingrowth of ^{13}C into the product molecules. A program for the study of the extraction of coal and oil shale using supercritical fluids is being carried out. The effect of the presence of piperidine on the amount of toluene solubles produced by supercritical extraction of coal with toluene/piperidine mixture has been determined. A new kinetic model for the extraction/liquefaction of coal by supercritical toluene and THF has been developed and proven satisfactory. Bruceton coal and Hi Na lignite have been extracted with supercritical water. 3 references, 7 figures, 6 tables.

32526 **(DOE/PETC/TR—84/8) Characterization of vacuum bottoms from the P-99 coal liquefaction unit.** Lett, R.G.; Schmidt, C.E.; Finseth, D.H.; Hough, M.R.; Link, T.A.; Sprecher, R.F.; Retcofsky, H.L. (USDOE Pittsburgh Energy Technology Center, PA). 1984. 60p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84014176.

A composite sample of vacuum bottoms has been analyzed by structural sensitive techniques applicable to high molecular weight, highly functional coal-derived materials. The utilization and limitations of x-ray diffraction, infrared, high resolution and ^{13}C-CP/MAS nuclear magnetic resonance, high resolution and field ionization mass spectrometry, and electron spin resonance are discussed. Particular emphasis is given to the characterization of methylene chloride soluble fractions, isolated by a combination of mild extraction and functionality-specific procedures, in terms of heteroatom functionality, molecular weight and carbon number distributions, and mean structural parameters. This nondistillate but soluble material is primarily a complex mixture of high molecular weight polynuclear aromatic and heterocyclic components with short alkyl substituents. The vacuum bottoms are low in phenolic OH functionality compared to typical SRC-II distillates. 9 references, 25 figures, 14 tables.

32527 **(DOE/RL/01830—T21) Development of an advanced water-gas shift conversion system. Quarterly progress report, February 1-April 30, 1984.** Sealock, L.J. Jr.; Elliott, D.C. (Pacific Northwest Lab., Richland, WA (USA)). May 1984. Contract AC06-76RL01830. 42p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84014085.

Portions are illegible in microfiche products.

A new project was initiated at Pacific Northwest Laboratory (PNL) in February 1984. The project sponsored by the US DOE Morgantown Energy Technology Center (METC) has as its objective to demonstrate the use of an aqueous catalyst system for conducting the water-gas shift reaction. Design and ordering of equipment for the experimental system was the major activity during the quarter. The continuous experimental system is built around an 11 autoclave and will be operated to prove the engineering concept and to establish processing conditions required to evaluate the potential of the process. The majority of equipment items have been received or are in transit. An Operational Readiness Review (ORR) is progressing which will allow operation of the Chemical Process Development Laboratory (CPDL). The CPDL is a 25 x 25 ft square building which will house the experimental system. An ORR board has been appointed by the PNL Director of Research and several meetings have been held. An ORR plan has been drafted and is being reviewed, as is the Safety Evaluation Document for the building. Refurbishing of the CPDL is nearly complete including fabrication and installation of the plate steel barrier that houses the experimental system. Assembly and installation of the continuous, water-gas shift reactor was initiated the last week of April and is expected to be completed in May. Standard Operating Procedures for the experimental system have been written and been sent to the PNL Industrial Health and Safety Department for approval. 7 references, 4 figures.

32528 **(EPRI-AP—3439) Roles and origins of active solvents for coal liquefaction. Final report.** Morrey, J.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1984. Contract AC06-76RL01830. 56p. NTIS, PC A04/MF A01; 1 - EPRI; GPO Dep. Order Number DE84012732.

Portions are illegible in microfiche products.

In today's liquefaction processes some coals give off gas and undergo retrogressive reactions before they have dissolved completely. The use of selective solvent recycle, however, may make it possible to dissolve coal completely and at milder conditions, thus eliminating the waste production of gas and unreactive by-products. In this project, RP2147-1, researchers performed a detailed chemical analysis of eight sample coal liquefaction solvents, both distillate and resid, using several techniques. The samples, whose liquefaction behavior was known, had been subjected to various degrees of hydrotreatment and distillation before analysis. The analysis sought a relationship between solvent composition, liquefaction conversion, and yield. Researchers also examined the impact of process conditions on the effectiveness of the solvents. The objective was to improve techniques for dissolving coal by identifying the roles and origins of active solvents and solvent components. The analytic techniques employed in this project gave a good representation of the easily identified solvent components. The composition of the extremely heavy material that is the most effective solvent recycle, however, remains unknown. Results indicated the following: The least effective residual solvent contained substantial amounts of light solvent (-800°F, mono- and dimethylnaphthalenes); the most effective residual recycle had been mildly hydrotreated (pyrene was its most abundant polyaromatic hydrocarbon); the typical distillate solvent (550 to 850°F) contained large quantities of aliphatics and resembled an SRC-II fuel-oil blend after severe hydrotreatment; and the distillate solvent also had a significant hydroxyl content. 21 figures, 7 tables.

32529 **(EPRI-AP—3498) Compaction and granulation of coal liquefaction residue. Final report.** Brugan, J.M.; Kohlmann, R.F.; Munro, D.R. (Allis-Chalmers Energy and Minerals Systems Co., Oak Creek, WI (USA). Process Research and Test Center). May 1984. 33p. Electric Power Research Institute-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920408.

Coal liquefaction residue was compacted into dense ribbon flakes and subsequently granulated into a particle size distribution

suitable for use in a high solids water slurry in a gasification process. The product granules apparent density was 85 to 90 percent of the true density of the residue and they displayed high resistance to dissolution in an aged, agitated slurry. The residue or ash concentrate, as derived from the Kerr-McGee Critical Solvent Deashing Process, is a fine particulate material that hinders stability and limits solids loading in slurry process applications, thereby affecting the overall gasification efficiencies and economics. Seventy-five tons of granules were produced in two successive 15 to 18 ton per day pilot plant operations. Descriptions of the processes and equipment, material properties, and material balances for typical operations are included.

32530 **(IEA/CREAS—84/08) Cost of liquid fuels from coal. Part 3. Methanol and methanol-derived gasoline.** (IEA Coal Research, London (UK). Economic Assessment Service). Mar 1983. 119p. (EAS/E—3/81/3). NTIS, PC $60.00.

This part of the study on the cost of liquid fuels from coal deals with the production of turbine-grade methanol, and of high-octane gasoline from methanol. In methanol production, coal is gasified, purified, adjusted in chemical composition and the resulting synthesis gas converted over a suitable catalyst. The crude methanol thus formed can be distilled to turbine-grade methanol or converted to gasoline using the Mobile MTG process. Production of these fuels using both dry-ash Lurgi and Texaco gasifiers is evaluated. The former gasifier involves either reforming of the methane produced to give additional synthesis gas or co-production as SNG. Coals considered are Illinois No. 6 and Wandoan (from Queensland, Australia), representing high-sulphur bituminous coal and low-sulphur sub-bituminous coal, respectively.

32531 **(LA-UR—84-1990) Optical detection of alkali compounds.** Oldenborg, R.C.; Baughcum, S.L. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84014031.

Portions are illegible in microfiche products.

The objective of this program is to develop a laser-based optical diagnostic technique, which should be applicable to the direct monitoring of trace levels of alkali compounds within the stream of a coal gasifier. The diagnostic is based on the observation that atomic emission is detected from alkali metals upon ultraviolet photodissociation of the parent compound. From the intensity of the atomic emission, the known absorption cross section of the parent compound, and the laser fluence, the concentration of the alkali compounds can be determined over an extreme range of conditions and their chemistry can be elucidated. KCl vapor was irradiated with an ArF laser that was Raman-shifted in both H_2 and D_2. The 766.5-nm atomic potassium emission (4^2P) was observed for all excitation wavelengths between 193 and 255 nm. The relative production efficiency drops dramatically for energies below the calculated threshold wavelength of 207 nm. An absolute detection sensitivity for KCl was determined at 0.2 ppB, which is better than required for anticipated fossil fuel monitoring applications. 5 figures.

32532 **(LBL—17671) Chemistry and morphology of coal liquefaction. Quarterly report, January 1, 1984-March 31, 1984.** Heinemann, H. (Lawrence Berkeley Lab., CA (USA)). Apr 1984. Contract AC03-76SF00098. 24p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013883.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

In task 1, selective synthesis of gasoline-range components from synthesis gas, rate expressions were developed for four different iron catalysts (promoted and unpromoted). Data for all four catalysts can be correlated by a semi-empirical expression. In task 2 catalyzed low temperature reactions of carbon and water, the catalytic activity for the production of hydrocarbons from graphite and water over KOH plus a co-catalyst was investigated for several first row transition metals. NiO showed the greatest activity. Several samples of ^{13}CO, $^{13}CO_2$ and H_2O adsorbed on graphite and on catalyst-graphite systems after reaction with steam were prepared for NMR investigation. In task 3 chemistry of coal solubilization and liquefaction, rate studies of quinoline reduction to tetrahydroquinoline in the presence of the homogeneous catalysts $(phi_3P)_3RhCl$ have provided definitive evidence that benzothiophene, indole, pyrrole, carbazole, thiophene, p-cresol and dibenzothiophene enhance the initial rate of hydrogenation of quinoline by a factor greater than 1.5. P-cresol was found to enhance the initial rate of hydrogenation of quinoline (1.6 to 2 fold) in a model coal liquid with polymer-supported (2% cross-linked) $(phi_3P)_3$ RhCl. 2 references, 6 figures.

32533 **(MLM—3158(OP)) Mass flow measurement at Wilsonville Advanced Coal Liquefaction Pilot Plant using micro motion mass flow meters.** Agarwal, A.K.; Turgeon, M. (Monsanto Research Corp., Dayton, OH (USA); Catalytic, Inc., Wilsonville, AL (USA)). 1984. Contract AC04-76DP00053. 14p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013280.

Coal liquefaction pilot plants require consistently accurate measurement of coal-liquid slurry flows for both control purposes and process development information. The Micro Motion mass flow meters have been successfully utilized in this harsh environment. A low-temperature (400°F) and a high-temperature (900°F) Micro Motion mass flow meter were installed at the Wilsonville Advanced Coal Liquefaction Pilot Plant. The low-temperature mass flow meter has been operating sucessfully in the preheater feed line for the past two years. The high-temperature mass flow meter has operated successfully in the deashing solvent line and the Kerr McGee unit coal slurry feed line. Based upon the information that has been acquired concerning the operation of these mass flow meters, it appears that the Micro Motion mass flow meter can be used for the measurement of mass flows in coal liquefaction facilities. 5 figures, 2 tables.

32534 **(NE/BF—82-17) Oil from peat and biomass. Final report from the fifth stage.** Bjoernholm, P. et al. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). Sep 1982. 134p. (In Swedish and English). NTIS (US Sales Only), MF A01. Order Number DE84751014.

Microfiche only, copy does not permit paper copy reproduction.

The aim of the project has been to present conceivable process systems for direct liquefaction of peat and biomass. Batch reactor tests have been carried out and have been extended to a continous bench scale of liquefying coal, peat and biomass. Methods have been designed for analysing and characterizing the complex products from direct liquefaction. The experimental results suggest that a satisfactory dewatering effect can be obtained around 300degreeC with relatively short residence times. The mild conditions in the first step of the process make the oxygenated groups of the raw material decompose to carbon dioxide. In the second step a distillable product is obtained. The process is believed to be advantageous also for relatively dry raw materials such as wood and milled peat.

32535 **(ORNL/SGMP—84/1) Surface Gasification Materials Program. Semiannual progress report for the period ending March 31, 1984.** Bradley, R.A. (comp.). (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 138p. NTIS, PC A07/MF A01; GPO Dep. Order Number DE84013492.

The objective of the Surface Gasification Materials Program is to conduct research and development on materials for application to the specific needs of coal gasification systems. One of the goals of the program is to evaluate innovative fabrication methods which have the potential to lower costs and improve reliability and safety for gasifier vessels and components. Another goal is to conduct engineering-scale development and application of materials for coal gasification systems to ensure that the materials of construction for pilot plants and future large-scale plants can be properly selected and specified. Contents of this report include the following: (1) plant materials surveillance tests; (2) slagging gasifier refractories; (3) protective coatings and claddings; (4) ceramic fabrication/application technology; (5) advanced pressure vessel materials technology; (6) electroslag component casting; (7) production and evaluation of electroslag castings; (8) cost reduction of the electroslag casting manufacturing process; (9) quantitative microstructural characterization of steel casting; and (10) materials review and component failure analysis in support of coal gasification processes and plants.

32536 **(PNL-SA—12342) Development of an advanced water-gas shift conversion system.** Sealock, L.J. Jr.; Elliott, D.C. (Pacific Northwest Lab., Richland, WA (USA)). May 1984. Contract AC06-76RL01830. 13p. (CONF-840695—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013265.

From 4. annual advanced gasification contractors' meeting; Morgantown, WV, USA (26 Jun 1984).

Pacific Northwest Laboratory (PNL) is investigating the use of an aqueous catalyst system for conducting the water-gas shift reaction under sponsorship of the US DOE Morgantown Energy Technology Center. Reseach in the project began in February 1984 and has centered on the design and fabrication of a 1.0 liter continuous bench scale reactor system. The chemistry of the system has been documented using a batch reactor system and the pressurized, aqueous system was shown to be very effective for the water-gas shift reaction because of its low temperature operation (300°C) and because the presence of excess water in the system pushes the equilibrium far to the product side. A five percent solution of Na_2CO_3 has been the catalyst of choice, however, a wide range of base catalysts including both alkali and ammonia compounds also catalyze the reaction. Continuous gas processing kinetic tests are currently being investigated. Application of the concept for processing coal gasification synthesis gas has many potential advantages over more conventional technology including the combination of gas quenching, water-gas shift tar conversion/removal and acid gas scrubbing. 7 references, 5 figures, 2 tables.

32537 **(SAND—84-0199C) Determination of the intrinsic activity and effective diffusivity of aged coal liquefaction catalysts.** Stephens, H.P.; Stohl, F.V. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 11p. (CONF-840805—5). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84010270.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

Although severe, rapid catalyst deactivation remains a major economic impediment to the production of liquid fuels from coal by direct processing, there have been few quantitative investigations of aged catalyst intrinsic activity and effective diffusivity. This study reports a method for determining these important properties under experimental conditions that accurately model actual conditions for the processing of coal-derived liquids. The power of the technique has been demonstrated by determination of the intrinsic hydrogenation activity and effective diffusivity of catalysts obtained from the Wilsonville, Alabama coal liquefaction test facility. The values of intrinsic catalyst activity and effective diffusivity reported here are based on kinetic measurements of the catalytic hydrogenation of pyrene. Pyrene was chosen as a chemical probe of these properties because it appears to play a key role as a hydrogen transfer agent in coal liquefaction. From determination of the pyrene hydrogenation rate constants for pairs of experiments, one with powdered catalyst and the other with whole extrudates, the fraction deactivated and the Thiele modulus, which relates the intrinsic rate constant to the extrudate effective diffusivity, were determined. Experiments with fresh, aged and regenerated catalysts have allowed the contribution of deactivation due to metallic contaminants to be separated from that due to carbonaceous material, and thus has allowed the mode of deactivation for each contaminant to be determined. 13 references, 4 figures, 3 tables.

32538 **(VTT-TUTK—228) Gasification of indigenous fuels and the use of gas in commercial greenhouses.** Leppaelahti, J.; Jantunen, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Dec 1983. 39p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland.

Possibilities of using gasification technique in the energy production of commercial gardens is discussed. The efficiency of a heating station where sod peat is first gasified to fuel gas with an updraft method and then burnt in a usual flue boiler was measured experimentally. The efficiency of gasification ranged between 84 and 92%. The product gas was burnt in a boiler with a nominal efficiency of 1.2 MW. The air coefficient of the combustion of moist tarry gas was 1.10-1.24 and the flue gas losses were 5-10%. The total efficiency measured indirectly was 80-84% in the output area studied when the area of output regulation was 1:4. The annual efficiency would be 81-82% on the basis of the test run. However, it is reduced by daily shutdowns and sudden output changes typical of commercial horticulture. The rising rate of gasifier output was measured after a 12 h daily shutdown. The output of the gasifier rose on average at the rate of 16 kW/min. The full capacity could be reached within about 75 min after starting the air blow. In practice, the shutdowns are shorter and the insulation of the gasifier better and hence the rising rate of output was considered sufficient with regard to commercial greenhouses. The economy of a gas-fired heating station was studied in output classes of 1.7 MW, 3.3 MW and 6.7 MW. The gasification heating stations were dimensioned as base load stations with 0.5 MW, 1 MW and 2MW outputs. The price of heat was respectively about FIM 160/MWh, FIM 143/MWh and FIM 124/MWh. The profitability is not reached if the costs are compared with oil heating costs of greenhouses. If the values given in the publication KTM B:18 of the Finnish Ministry of Trade and Industry are taken as the investment and the technical efficiency values of oil heating, the profitiabilty is reached in size classes of 3.3 MW and 6.7 MW.

32539 **Department of Energy's 1978 underground coal conversion program.** Burwell, E.L.; Sikri, A.P.; Zukor, S.H. *Transactions of the American Nuclear Society;* **30**: 2(Win 1978).

The US has an abundance of energy resources, yet is currently facing grave energy supply problems. This results from heavy reliance on petroleum and natural gas, domestic reserves of which are dwindling, while the most abundant fossil energy resource (coal) is underutilized. Coal is the primary nonnuclear source for expanding domestic energy supplies through the year 2000. However, conventional underground and strip mining can recover only 6% of the 4.8 trillion Mt coal resource. Underground coal gasification (UCG) is one technology that can complement conventional mining by recovering the energy in unminable coal seams in the form of combustible gases. Coal is gasified underground by drilling boreholes into the coal seam and injecting air (or oxygen and steam) into the underground reaction zone. The hot product gases are forced through the coal to the exit borehole and are carried to the surface, where they are cleaned and processed for use.

32540 **(CONF-840754—1) Potential of nuclear methods for development of novel on-line sensors for coal analysis.** Herzenberg, C.L. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013432.

From 5. annual meeting of the Fine Particle Society; Orlando, FL, USA (30 Jul 1984).

A study has been conducted to identify nonstandard and novel instrumental analysis techniques and to evaluate their potential for development to provide new types of sensors for on-line analysis of coal and for other fossil energy applications. New methods from basic research, and methods used or considered for use in other industries such as mineral and basic metal industries, in petroleum and other well logging, and in biomedical applications have been examined. Particular fossil energy applications have been identified, and equipment requirements and spoolpiece and window requirements for process stream measurements, development status, obstacles to be overcome in development, and other relevant topics have been investigated. Over 60 distinct nuclear techniques (or variations on techniques) have been identified, most of which can be used to determine element concentrations in bulk materials, many of which have potentially significant applicability to coal analysis. The present paper highlights and summarizes some of the more important substantive content abstracted from an extensive and detailed report of the investigation. 9 references, 6 tables.

32541 **(CONF-840805—14) Factors influencing trace element variation in U.S. coals.** Lindahl, P.C.; Finkelman, R.B. (Argonne National Lab., IL (USA); Exxon Production Research Co., Houston, TX (USA)). 1984. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012097.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

In this paper, the authers made several broad generalizations regarding factors that influence trace element variations. They urge that in interpretative work these generalizations be applied carefully. A critical evaluation of existing trace element data would probably result in identification of anomalous values and elimination of suspect data. Several questions might be answered by such an evaluation; for example, do the two K values in the high-ash region of Figure 1 deviate signeificantly from the trend of the other data because of analytical errors or recording errors. Are they legitimate geochemical anomalies. Analytical chemists and geologists are urged to interact closely because this is one of the best ways to improve the quality of analytical methodology and data, and geological interpretation. The nature of trace element variations, for whatever cause, highlights the need to more judiciously select representative samples for reliable quantitative analyses. Statistical techniques, such as principal component analysis, should help in resolving the influence of the factors affecting trace element variations in coal. It is hoped that this paper will encourage more detailed study of factors influencing trace element variations in coals. 19 references, 3 figures, 4 tables.

32542 **(CONF-840805—15) Premium coal sample program at the Argonne National Laboratory.** Vorres, K.S. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012108.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

Portions are illegible in microfiche products.

The purpose of the Premium Coal Sample Program is to provide the coal science research community with long term supplies of a small number of premium coal samples that can be used as standards for comparison. The premium coal samples produced from each coal and distributed through this program will be as chemically and physically identical as possible, have well characterized chemical and physical properties, and will be stable over long periods of time. Coals will be mined, transported, processed into the desired particle and sample sizes, and packaged into environments as free of oxygen as possible. Humidity will also be controlled to keep the coals as pristine and in as stable of a condition as possible. Initial samples are expected to be available in fall, 1984. Samples will be made available to research personnel at a nominal replacement cost. Each recipient of samples is asked to provide either a literature reference to papers in widely circulated journals, or a copy of less widely circulated reports and papers, to be shared with other users of the samples. Listings of these references will be available on request to the author either in printed versions or via computer terminal. The Premium Coal Sample Program expects to work with other coal sample programs in providing samples and sharing information. Following the reports from the use of a number of samples, workshops are planned to facilitate sharing research results and to foster basic understanding of the chemistry and physical properties of the coal.

32543 **(CONF-8405154—5-Draft) Thermal conductivities of Wilsonville solvent and Wilsonville solvent/Illinois No. 6 coal slurry.** Wilson, J.H.; Mrochek, J.E.; Johnson, J.K. (Oak Ridge National Lab., TN (USA)). 1984. Contract AC05-84OR21400. 40p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012359.

From American Institute of Chemical Engineers spring national meeting; Anaheim, CA, USA (20 May 1984).

Portions are illegible in microfiche products.

Thermal conductivities of a Wilsonville solvent and of a slurry prepared from this solvent and Illinois No. 6 coal have been measured at temperatures from 295 up to 500 K. With increasing temperature, the thermal conductivity varied from 1.23 to 1.02 mW cm^{-1} K^{-1} (296 to 438 K) and from 1.51 to 1.02 mW cm^{-1} K^{-1} (295 to 505 K) for the solvent and the slurry, respectively. At room temperature, measurements on toluene were accurate to within 3% of literature values. 18 references, 9 figures, 7 tables.

32544 **(DOE/METC—84-8, pp 3-15) X-ray computerized tomography of coal.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-82MC19210.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

X-ray computed tomography (CT) is being used to investigate the internal structures of as-mined coal and of coal as it is being processed. In particular, experiments are planned to image the devolatilization, pyrolysis, and combustion of coal as it occurs inside a furnace mounted within a CT machine. The X-ray CT machine nominally gives an image of the electron density distribution within an object. This has not been a classical way of describing coal; and therefore, the first stages of this investigation involve the development of an understanding of the relationships between CT images and the more classical descriptions of coal, its petrography and porosity. Experimental results to date strongly suggest that the CT technique has adequate density resolution to distinguish and determine petrographically interesting species. In studying coal porosity, considerable computer programming has been necessary to obtain reasonable images of xenon in coal. However, preliminary results show that xenon does not penetrate uniformly in the coal, that the pattern of the gas flow in the direction of the bedding planes is quite different to that across the planes, and that the preferential regions for gas penetration is into regions that appear to be high in mineral matter. 2 references, 5 figures, 2 tables.

32545 **(DOE/PC/30013—F9) Data base for the analysis of compositional characteristics of coal seams and macerals. Final report, Part 9. Interaction of gases, vapors and liquids with coals and macerals at ambient temperatures: their use to characterize porosity.** Walker, P.L. Jr.; Davis, A.; Verma, S.K.; Rivera-Utrilla, J.; Khan, M.R. (Pennsylvania State Univ., University Park (USA)). May 1984. Contract AC22-80PC30013. 89p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84012698.

The interaction of Hg, He, CO_2, water, and methanol at room temperature with a wide variety of -20 mesh American coals and 45 maceral concentrates has been studied. This interaction has been used to characterize porosities in these coals and macerals. Displacement of Hg and He, from which densities of coals and macerals in these fluids were calculated, has been measured. Exposure of coals and macerals to these fluids results in little change in their structure. Hence, pore volumes calculated to be accessible to He from density data, are taken as true values. Pore volumes accessible to CO_2, water, and methanol frequently exceed those accessible to He, despite its being a smaller molecule. This is attributed to the swelling of coals in the presence of CO_2, water, and methanol due to a combination of adsorption on the walls of micropores and imbibition into the solid structure. Swelling in water and methanol was confirmed on many coals and macerals using a combination of fluid densities, as measured by use of a pycnometer, and fluid uptake, as measured gravimetrically. Swelling of coals and macerals in water and methanol increases significantly with decreasing rank. Expansion of beds of coal and maceral particles was measured in CO_2 and methanol using a dilatometer. Expansion in CO_2 increases sharply as CO_2 partial pressure (activity) is increased from 0.016 to 0.76. For coals of higher rank, expansion in CO_2 and methanol, at equivalent relative pressures, are similar. On the other hand, for coals of high volatile bituminous and lower ranks, expansion in methanol is considerably higher than that in CO_2. The swelling of coals in different fluids is expected to have a profound influence on the rheology of the fluids. This has implications when coal-liquid slurries are used in combustion and gasification processes. 33 references, 16 figures, 19 tables.

32546 **(DOE/PC/60791—2) Solid state NMR methods for coal science. Progress report, January 1-March 31, 1984.** Zilm, K.W. (Yale Univ., New Haven, CT (USA). Dept. of Chemistry). Apr 1984. Contract FG22-83PC60791. 11p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013178.

This report covers the progress made on the title project. The solid state NMR spectrometer has been completed and test results are presented. A number of alternative probe circuits have been evaluated for our solid state work. One has been found to be particularly efficient in use of decoupling power. Some progress has also been made in construction of a magic angle spinner for our probes as well. 2 figures, 1 table.

32547 **(ECN—83-174) Trace elements in imported coal.** van der Sloot, H.A.; Zonderhuis, J.; Mey, R. (Stichting Energieonderzoek Centrum Nederland, Petten). Oct 1983. 22p. (In Dutch). ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

The results of many coal samples analysed at ECN are compiled. The samples are representative for coal imported for Netherlands utility plants. Trends can be given for marine or fluvial origin of the coal. Generally there is less variability in trace elements in one load of coal.

32548 **(ECN—83-179) Combustion properties of oxidized and weathered coals in a fluidized bed.** Vleeskens, J.M. (Stichting Energieonderzoek Centrum Nederland, Petten). Nov 1983. 21p. ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

Gentle pre-oxidation of bituminous coals did not markedly influence their combustion behavior in a fluidized bed. Neither the amount of unburnt matter nor the final burnout diameter of the char particles changed through oxidation. Also, the vitrinite reflectance was the same before and after oxidation, as could be expected. Therefore, a previously reported correlation between rank and combustion efficiency is also valid for slightly oxidized coals. Natural weathering, however, showed a serious decrease of combustion efficiency. It is concluded that such deterioration is not related to changes in oxygen content or swelling properties.

32549 **(MLM—3151) Activities of isotopes of uranium, thorium, radium, and lead of Antarctic coals.** Gilbert, G.E.; Casella, V.R.; Bishop, C.T. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 11 Jun 1984. Contract AC04-76DP00053. 9p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013541.

Five coal samples from the Transantarctic Mountains of Antarctica were analyzed for the primordial radionuclides uranium-238, thorium-232, and uranium-235, the parents of the naturally occurring uranium, thorium, and actinium disintegration series, respectively. In most of the samples, the radionuclides uranium-234, thorium-230 radium-226, and lead-210 of the uranium series and radium-228 and thorium-228 of the thorium series were also measured and found to be in secular equilibrium with their parents. Activities of uranium-238, thorium-232, and uranium-235 ranged from about 0.1 to 1.0 pCi/g, 0.09 to 1.1 pCi/g, and 0.006 to 0.06 pCi/g, respectively. These results are comparable to corresponding activities reported for United States coals. 10 references, 3 tables.

32550 **(PB—84-179183) Photoacoustic microscopy of coal macerals. Annual report Jan-Dec 83.** Johnson, K.W.; Telschow, K.L.; Crelling, J.C. (Southern Illinois Univ., Carbondale (USA)). Jan 1984. 41p. NTIS, PC A03/MF A01.

See also PB83-195123.

The overall objective of the project is to develop photoacoustic microscopy as a new, in situ technique for delineating the thermal and chemical properties of coal macerals. This petrographic information is expected to play a role in the characterization of coal for any process where the properties of the coal determine the behavior of the process. To characterize coal properly, both its chemical composition and its thermal properties must be known. Photoacoustic microscopy offers a potentially useful technique for probing the thermal-conductance and thermal-elastic properties of coal macerals. Coupled with the traditional reflectance measurements, which yield information about the optical properties of macerals, photoacoustic microscopy is expected to produce a more comprehensive classification of the properties of macerals. The major result achieved has been the development of a photoacoustic/reflectance microscope capable of obtaining thermal and optical data from the same coal macerals. The data shows that there are significant differences between the thermal properties of vitrinite and pseudovitrinite macerals. The differences are especially prominent for low rank coals, such as Hi-Vol A, and gradually disappear in the higher rank coals beginning with semi-anthracite. It is shown that the photoacoustic data compliments existing reflectance data when used for coal characterization.

32551 **(STF—15A83025) Peat in Nord-Troendelag. A survey of the selection of products and the production methods.** Nilssen, E.; Groenning, A.; Karlsvik, E. (Trondheim Univ. (Norway). Vassdrags- og Havnelaboratoriet). May 1983. 106p. (In Norwegian). NTIS (US Sales Only), PC A. Order Number DE84751025.

Paper copy only, copy does not permit microfiche production.

The report discusses the possibilities for future use of the peat resources in the county of Nord-Troendelag. Different types of agricultural and fuel peat are the most interesting products. A number of different methods for taking out and drying peat are mentioned and considered. A survey of the sales possibilities for fuel peat in the county is made. Private consumers, official buildings, businesses, green houses and district heating installations would be possible consumers. 24 drawings, 9 photos, 22 tables.

32552 **(VTT-TUTK—232) Development of sampling method for milled peat.** Impola, R.; Okkonen, J. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Nov 1983. 82p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland.

The price of peat is generally determined by its energy content which again depends on the moisture of peat and the heat value of dry peat. To determine these qualities we have to take samples of peat. Sampling is now made manually. Consequently the errors caused by human factor can be disproportionate large. We can avoid systematic errors in sampling by developing automatic sampling and sample handling methods. However, as manual sampling is not to be abandoned in the near future, we have in the investigation sought optimum solutions also for this sampling method. The number of samples, volume of sample, sampling place and method and handling of samples have been evaluated. By making the manual sampling as systematic as possible we can reach better results. One object for study was the moisture distribution of the milled peat layer on a conveyor belt, primarily as a function of belt width. The differences in moisture distribution observed were so large that when samples are taken from a moving peat flow the sample must represent the cross section of the whole peat flow. When samples are taken directly from the load, it is difficult to obtain representative samples. We investigated how a sampling tube operated with compressed air functions and how reliable the peat samples were. It was found that the peat samples did not dry significantly during sampling. Sampling by compressed air can be considered one alternative when we proceed to use automatic and mechanical sampling systems. The investigation presents a proposal on manual or mechanical sampling in power plant. Mechanical sampling is the most recommendable. However, it is difficult to achieve in peat deliveries. To follow the basic principles of sampling is even in mechanical sampling almost impossible when there are several suppliers and when quality control has not been considered in plant design.

0108 Waste Management

32553 **(CONF-8405196—1) Dry scrubbing at Argonne's 20MW boiler.** Farber, P.S. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013457.

From 82. annual convention of the National Lime Association; Charleston, SC, USA (17 May 1984).

Portions are illegible in microfiche products.

Argonne has had in operation for the last two years a high-sulfur dry FGC system. (1) We have successfully demonstrated that reliable, economical, removal of sulfur dioxide at, and above, the levels dictated by the NSPS is possible. (2) It has been shown that a lime-based spray dryer can perform successfully in a retrofit

mode, removing 70% of the inlet SO_2. (3) System economics based on actual operation have been ascertained, and seem to be in line with published estimates. (4) Waste studies have indicated that there is a dependence of pH upon leachate concentration but, no concentration of elements were high enough to classify wastes from a dry scrubbing system as hazardous. 7 figures, 4 tables.

32554 **(DOE/FE/60181—23) Gasifier wastewater treatment: Phase I cooling tower assessment.** Mann, M.D.; Willson, W.G.; Hendrikson, J.G.; Winton, S.L. (North Dakota Univ., Grand Forks (USA). Energy Research Center; Radian Corp., Austin, TX (USA)). 1984. Contract FC21-83FE60181. 37p. (CONF-840828—2). NTIS, PC A03/MF A01; GPO Dep. Order Number DE84007671.

From International synfuels policies and technologies symposium; Philadelphia, PA, USA (19 Aug 1984).

The principle goal of the gasification research at UNDERC is to develop environmental data on the treatability of wastewaters from the fixed-bed gasification of lignite. Research activities are focused around the cooling tower, where the reuse of treated gasification wastewaters has not been demonstrated in this country. The objective of Phase I cooling tower testing was to evaluate the effectiveness of using minimally treated wastewater (solvent extracted and steam stripped - referred to as stripped gas liquor) as makeup to a cooling tower. Ammonia, alkalinity, phenol, and other non-hydantoin organics were removed from the cooling water by stripping and/or biological degradation. Foaming of the circulating water will be a problem using SGL as makeup and foaming control will be required. The SGL feed cooling system supported a high level of biological activity (1 to 10 million/ml). Pseudomonas aeruginosa was identified as the predominant specie in the system. Severe fouling can be expected for all carbon steel surfaces. Fouling of stainless steel was not a major problem. General corrosion rates of 10 to 24 mils/yr were measured for carbon steel in various parts of the system. Carbon steel heat exchanger tube analysis indicated pitting corrosion penetration rates of 20 to 125 mils/yr under deposits. Computer analysis also indicated a strong potential for scaling from calcium carbonate precipitation. Results from this study indicate that the use of stripped gas liquor similar to that produced by the UNDERC pilot gasifier as cooling tower makeup is limited by a number of potentially serious operating problems. This water could be used for cooling tower makeup only after additional treatment or possibly with the use of biocides, corrosion inhibitors, and other control methods. 12 references, 6 figures, 7 tables. (DMC)

32555 **(DOE/FE/60181—50) Treatment of coal gasification wastewater using rotating biological contactors.** Wernberg, K.B.; Strain, J.H.; Turner, C.D.; Gallagher, J.R. (North Dakota Univ., Grand Forks (USA)). Jun 1984. Contract FC21-83FE60181. 22p. (CONF-840749—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013302.

From 2. international conference on fixed-film biological processes; Arlington, VA, USA (10 Jul 1984).

Reuse of coal gasification process water for makeup cooling tower water requires physical, chemical and biological treatment to prevent excessive corrosion and bio-fouling in the tower. Pretreated wastewater contains about 2100 mg/l BOD, 5800 mg/l COD, 2000 mg/l TOC, 560 mg/l ammonia, 30 mg/l cyanide, 190 mg/l thiocyanate, 180 mg/l phenols, and 1700 mg/l hydantoins. Single-stage RBC treatment was effective in biotreatment of this wastewater even though feed strength was highly variable. Removals at a hydraulic loading of 1 gpd were 94% for BOD, 33.8% for COD, 33% for TOC, and 100% for phenols. Ammonia, thiocyanate, cyanide and hydantoins were not removed to any significant degree in this system. 6 references, 10 figures, 4 tables.

32556 (DOE/METC—84-8, pp 358-367) **Treatment of coal gasification process wastewater.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objectives of this program are to assess treatment requirements and develop control strategies for wastewater from coal gasification processes in order to ensure the availability of effective and economical environmental controls. The series of investigations reported here provides information useful in the design of physicochemical wastewater treatment operations and the incorporation of these units in an integrated train for the treatment of coal gasification process wastewaters. The investigations discussed include: (1) a study of the effect of solvent extraction on the operation of a biological treatment system and subsequent polishing steps; (2) a determination of the effectiveness of the ozonation of biologically treated wastewater; and (3) a study of the use of wet air oxidation for the treatment of these wastewaters. The wastewater treatment program at PETC has provided data from bench-scale evaluations of various wastewater treatment unit operations and processes documenting the effectiveness of these environmental controls and providing useful information for the design of large-scale facilities. 3 figures, 3 tables.

32557 (DOE/METC—84-8, pp 368-380) **Environmental studies - fixed-bed gasification.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective is to: (a) operate a wastewater treatment system, including a cooling tower simulation unit, in a manner approximating that intended for the Great Plains Gasification Associates (GPGA) commerical plant; (b) determine the environmental and process consequences of using minimally pretreated wastewater in cooling tower; and (c) provide for contingency testing of an activated sludge treatment step, if required. The initial wastewater treatment process being studied, consists of tar/water separation, phenol extraction, ammonia stripping with concentration in the cooling tower, and disposal in incinerator. An optional treatment step is biological treatment with possible addition of powdered activated carbon. The effluent treated in the pilot plant is from gasification of the same lignite as being used by GPGA, the difference being that GPGA gasifiers are dry bottom Lurgi while UNDERC uses a slagging unit. The first coolig tower test was initiated on March 31, 1983, and was completed May 26, 1983. Results are discussed. Preliminary conclusion is that minimal treatment of UNDERC-SFBG wastewater is inadequate for use as feed to the cooling tower. 4 figures, 5 tables.

32558 (DOE/METC—84-8, pp 381-385) **Fixed-film fluidized-bed bioreactors for biooxidation of coal converison wastewaters.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The program to develop and evaluate the fixed-film, fluidized-bed bioreactor for treatment of coal gasification wastewaters consists of the following major tasks: design and construct a laboratory-scale bioreactor system, develop a synthetic feed for initial studies, establish a suitable culture of fixed-film microorganisms, and determine appropriate conditions for steady-state operation of the bioreactor; (2) assess the performance of the bioreactor in terms of degradation of phenolics and develop mathematical models for process evaluation, reactor design, and scale-up studies. Compare performance with conventional biooxidation systems using published data. Validate initial conclusions using complex and/or real wastewaters; (3) design and construct a 1-gpm system and evaluate performance with field tests or with real wastewaters transported to Oak Ridge National Laboratory. Typical operating data of bioreactor performance are presented in Table 1. Results show that effluents with phenol concentrations < 1 mg/L can be obtained in this reactor with influent phenol in the 30 mg/L range. This result and kinetic batch studies indicate that higher phenol concentrations could probably be reduced to <1 mg/L by using a longer residence time. 2 tables.

32559 **(EPS—3-WP-82-4) Characterization and treatability of drainage samples from coal piles at steam electric power stations.** (Environment Canada, Ottawa, Ontario. Environmental Protection Service). 1982. 159p. Environment Canada, Environmental Protection Service, Ottawa, Ontario.

A literature review of the nature and characteristics of drainage water from outdoor coal stocks indicated that in eastern Canada the drainage was frequently highly acidic, with elevated

concentrations of dissolved iron and heavy metals; western Canadian coals, which contain less sulphur, produced a drainage water with lower amounts of metals and trace elements, a more neutral pH, but higher suspended solids contents. Coke pile drainage, by contrast, was slightly alkaline with appreciably lower concentrations of both organic and inorganic substances. Samples from coal piles at 5 coal-fired generating plants and 2 coke plants at steel mills were analysed to assess their susceptibility to treatment. The most cost-effective treatment for drainage water from eastern coal piles consisted of pH adjustment with lime and the addition of an anionic polyelectrolyte as a coagulant aid. Successful treatment of western coal pile drainage involved the addition of either lime or calcium chloride as the primary coagulant, addition of polyelectrolyte being required occasionally to improve settling.

32560 (INIS-mf—8861, pp 389) **Experiences with zirconium dioxide measuring cells for oxygen concentrations in flue gases.** Siemer, K. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

Solid-electrolyte analyzers are increasingly applied for O_2 analysis in flue gases. The measuring probe is often installed in the flue while the electronic components can be as far as 100 m away. ZrO_2, a ceramic material, is electrically conductive at temperatures beyond 600°C. At these temperatures, oxygen ions move freely in the crystal lattice. By separating two gas volumes by a small ZrO_2 plate with porous platinum electrodes and heated to more than 600°C, a voltage U can be measured between the electrodes. This voltage U, as described by the Nernst equation, is a function of temperature and of the oxygen partial pressures.

32561 (INIS-mf—8861, pp 389) **Measuring methods in a flue gas desulfurization plant.** Ronig, H.W. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

A flue gas desulphurisation plant (Scholven F) is described, i.e. circuits, methods of measurement and measuring instruments. Experiences with different measuring systems are presented.

32562 (IS-T—1095) **Granulation of nomagnetic fly ash-coke mixtures.** Feisel, B.C. (Ames Lab., IA (USA)). Jun 1984. Contract W-7405-ENG-82. 119p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013912.

Portions are illegible in microfiche products; Thesis.

The granulation of different nonmagnetic fly ash-coke mixtures with subsequent heat treatment and reaction was investigated. Conclusions of this study are: (1) adjustment of the pan granulator machine variables produced a variety of granule sizes, but did not provide adequate granule strength for these mixtures; (2) percent addition of additives to increase granule strength was found to exceed that which would make their use economical; (3) granule strength increased with increasing firing temperature in an inert or an oxidizing atmosphere; (4) firing in an oxidizing atmosphere produced granules of much greater strength than firing in an inert atmosphere; (5) granule strength increased with increasing firing time in an inert or an oxidizing atmosphere; (6) unfired and inert fired granules were determined to be homogeneous throughout with respect to carbon and other major elements; (7) carbon content decreased with increasing firing time in an oxidizing atmosphere until finally dropping to nearly zero; (8) granule strength increasing linearly with granule size; (9) granule strength increased with decreasing particle size of the feed mixture; (10) a sintering mechanism by which particles melt at the points of content and small pores are closed accounted for the increased granule strength upon firing; (11) granules fired in an oxidizing atmosphere were found to consist of an outer shell lacking in carbon particles which increased with firing time; (12) granules were quite porous before and after firing; (13) chlorination performance of granules was as good as that of loose mixtures of fly ash and coke; (14) carbon to ash ratio was not a controlling variable over the range studied for the powder or the granule chlorinations; and (15) granule strength was found to decrease with the degree of conversion, but was still sufficient for maintaining bed integrity and for handling. 80 references, 42 figures, 10 tables.

32563 **(PB—84-158724) Mccallum study area: resource and potential reclamation evaluation. Final report.** (Water and Power Resources Service, Denver, CO (USA)). Sep 1983. 307p. (R—26-79). NTIS, PC A14/MF A01.

See also PB84-158716. Sponsored in part by Geological Survey, Denver, CO.

The purpose of this investigation was to collect baseline data for establishing reclamation objectives and lease stipulations. The report includes data on climate, biological and cultural resources, physiography, geology, coal resources, soil overburden, vegetation, and hydrology. The study area is within Moffat County in Colorado.

32564 **(PB—84-161470) Development of criteria for extension of applicability of low emission, high efficiency coal burners. Annual report Sep 77-Sep 78.** Brienza, A.; Chen, S.; Heap, M.; Lee, J.; Nurick, W. (Energy and Environmental Research Corp., Irvine, CA (USA)). Feb 1984. 192p. NTIS, PC A09/MF A01.

See also PB82-197153.

The report gives results of the first year's effort on this contract. Experimental studies were conducted at three scales to determine the influence of coal properties on NOx emissions. In addition, the use of sorbents to reduce SOx emissions from coal flames was investigated. Bench-scale (0.1 million Btu/hr) investigation concentrated on studies to define the effect of coal characteristics on fuel nitrogen conversion. Based on these investigations, the total coal nitrogen content does not appear to be the primary variable controlling fuel NO production in pulverized-coal flames. Experiments were conducted with research-design low-NOx burners at two scales (12.5 and 100 million Btu/hr) using three coal types. Under optimum conditions, the NOx emissions, typically below 200 ppm (dry at 0% O_2), were only slightly dependent on coal characteristics. Preliminary investigations assessed the use of the low-NOx burner design to reduce NOx and SOx emissions by adding sorbents to the coal before the pulverizer. Limestone added this way gave 50, 70, and 80% reductions in SO_2 emissions at calcium/sulfur molar ratios of 1, 2, and 3, respectively.

32565 **(PB—84-162890) Experimental and engineering support for the CAFB (Chemically Active Fluid-bed) demonstration: residue disposal/utilization. Final report 1979-82.** Peterson, C.H.; Ulerich, N.H.; Newby, R.A.; Keairns, D.L. (Westinghouse Research and Development Center, Pittsburgh, PA (USA)). Feb 1984. 124p. NTIS, PC A06/MF A01.

The report gives results of an investigation of the disposal and utilization of spent sulfur sorbent from the Chemically Active Fluid-bed (CAFB) process. Lignite ash with a minimum of 10% CaO can be used as a replacement for sand or medium aggregate or as a partial replacement for light aggregate in cement block manufacturing with higher strengths (14.68 to 26.82 MPa) than standard mixes, 4.62 to 5.62 MPa at 28 day cure tests. This indicates that the cement content of the mix may be reduced when CAFB residue is used. Disposal tests indicate that pH, calcium, and sulfate in the leachate are primary environmental concerns. Some lignites and coal may produce levels of trace materials (e.g., selenium, iron, and manganese) that exceed regulations. Any appreciable sulfide in the spent sorbent must be converted to sulfate before disposal. Fine particle size, possibly as small as -44 micrometers, appears necessary for complete conversion of the calcium sulfide to calcium sulfate in completely sulfided sorbent. Cementitious compounds may be formed under CAFB operating conditions, thus aiding disposal and reducing leachates from the spent sorbent.

32566 **Adsorption-enhanced biogasification of coal conversion wastewater.** Harper, S.R.; Cross, W.H.; Pohland, F.G.; Chian, E.S.K. (Georgia Inst. of Tech., Atlanta). *Biotechnology and Bioengineering Symposium;* No. 13, 401-420(1983). (CONF-830567—).

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

Activated carbon adsorption has been observed as instrumental in maintaining environmental conditions conducive to biological conversion of coal-gasification wastewater. The relationship between adsorption and biodegradation was studied in a series of

reactors and in a singular reactor to which fresh carbon was added periodically. The potential for improved biological conversion of the relatively refractory wastewater has been demonstrated and preliminary data have been extended to suggest design and operational strategies. 10 references, 9 figures, 8 tables.

This study is one of several commissioned by the Bonneville Power Administration (BPA) to estimate the economic value of the environmental costs and benefits of different electricity-generating resources. In it we described and quantify the environmental costs and benefits of coal-fired generators, using the plant in Boardman, Oregon, as the basis for our estimations. The Boardman plant uses pulverized coal to produce steam for generating electricity. It is nominally rated at 550 megawatts. This study assumes a 70% load factor and an annual production of 3373 x 10^6 kWh. Cooling water comes from a 1400-acre cooling pond; coal comes from Wyoming in 100-car unit-trains every two days. The estimated service life of the plant is 40 years. We developed a socioeconomic-environmental model to assess the final physical impacts of each of the initial impacts resulting from the fuel cycle. The analysis of environmental effects comprises four steps: (1) identify all the potential environmental impacts stemming from the entire fuel cycle associated with the plant; (2) determine which effects warrant detailed economic analysis; (3) complete the economic analysis for the effects selected in step 2; and (4) estimate the extent to which the results of the case study apply to other potential plants using the coal-fuel cycle. 102 references, 5 figures, 10 tables.

32568 (EPRI-CS—3182-Vol.1, pp 2.1-2.12) **Utility perspective on NO/sub x/ control.** Goodman, C.H. (Southern Co. Services, Inc., Birmingham, AL). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

The status of legislative and regulatory activities that could require further NO/sub x/ emission reductions from existing and/or new coal-fired power plants are reviewed. Revised ambient air quality standards, visibility protection requirements, revisions of New Source Performance Standards, application of Prevention of Significant Deterioration requirements, and acid deposition legislation will be discussed. When possible, comments will be made concerning the need for investing R & D resources in further NO/sub x/ control research. 4 figures.

32569 (EPRI-CS—3182-Vol.1, pp 4.1-4.22) **Status of NO/sub x/ controls for Riley Stoker wall-fired and turbo-fired boilers.** Lisauskas, R.A.; Rawdon, A.H. (Riley Stoker Corp., Worcester, MA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Large pilot scale and full size field data are presented on a new low NO/sub x/ retrofit burner design for pulverized coal wall-fired boilers. NO/sub x/ reductions of 50 to 60 percent have been achieved with this retrofit burner on three large (greater than 300 MW) utility boilers. An update of Turbo furnace NO/sub x/ controls is also given. NO/sub x/ field results are presented on the effects of underfire air and variable direction coal spreaders. In addition, the results of pilot scale burner aerodynamic tests are discussed, and the effects of staged combustion on furnace heat transfer are predicted. 9 references, 20 figures, 2 tables.

32570 (EPRI-CS—3182-Vol.1, pp 8.1-8.22) **Long term optimum performance/corrosion tests of combustion modifications for utility boilers.** Ferraro, J.M.; Natanson, P.S.; Vaccaro, R.M. (Exxon Research and Engineering Co., Florham Park, NJ). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Field testing is being conducted to evaluate emissions and corrosion at coal-fired utility boilers designed to meet New Source Performance Standards. This work, an extension of similar programs sponsored by the EPA, is intended to evaluate the long term emissions and corrosion effects of combustion modifications instituted primarily for NO/sub x/ control. The work effort of this program is being accomplished in several phases. The first phase consists of preparation and performance of a detailed test matrix designed to provide a thorough characterization of combustion modification (overfire air, low excess air, etc.) techniques applicable to each unit. This results in recommended low NO/sub x/ operating conditions for long term testing. Then, during the long term testing, major emphasis is placed on quantitative measurement of furnace tube wall corrosion under low NO/sub x/ firing conditions. This is accomplished through evaluation of short term (corrosion probe) test results as well as scheduled long term water wall tube thickness measurements inside the boiler. Other work performed during the long term test period has included Level 1 environmental assessment testing with physical, chemical, and biological analysis of various effluent streams. Flue gas analysis includes measurement of NO and NO/sub x/, CO, CO_2, O_2 and SO_2/SO_3. Particulate grain loading, size distribution and precipitator capture efficiency are also being evaluated. In addition, several 30-day continuous monitoring tests (NO/sub x/, O_2, CO, CO_2) will be performed at each unit. This paper discusses the results and status of work performed thus far. 7 references, 6 figures, 8 tables.

32571 (EPRI-CS—3182-Vol.1, pp 9.1-9.15) **Analysis of long-term NO emission data from pulverized coal-fired utility boilers.** Cherry, S.S. (KVB, Inc., Irvine, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Long-term NO emission monitoring data obtained from nine pulverized coal-fired utility boilers were analyzed. These data were in the form of hourly-averaged NO, O_2(or CO_2) and load with NO and O_2/CO_2 being measured by certified continuous emission analyzers. The analyses were compared to the emissions limitations enumerated in both the 1971 and 1978 New Source Performance Standards (NSPS). The comparison with the 1978 NSPS showed that seven of the nine boilers would have produced no periods of excess NO emissions on a 30-day rolling average basis. In addition, the same seven boilers would have complied with the 1978 NSPS NO/sub x/ Performance test requirements. Recommendations are made to more fully analyze the operation of two of these boilers to establish if their mode of operation could be adopted by other boilers. These boilers use permanently installed CO monitors to allow operation at the lowest practical excess air to achieve either low NO emissions or better fuel efficiency.

32572 (EPRI-CS—3182-Vol.1, pp 14.1-14.38) **Status of Japanese technical development for coal combustion NO/sub x/ control.** Nakabayashi, Y.; Miyasaka, T.; Mouri, K. (Electric Power Development Co., Ltd., Tokyo, Japan). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

The Electric Power Development Co., Ltd. reviewed NO/sub x/ combustion control R & D for coal-fired power plants at two previous NO/sub x/ Symposia. This third presentation mainly describes the first year operational results of the Matsushima Thermal Power Station (500 MW x 2 units) which was designed based on the results of our R & D program. The paper also concerns the

NO/sub x/ control design of the Takehara Thermal Power Station, unit No. 3 (700 MW) which is currently under construction and scheduled to start operation in March 1983. The infurnace DeNO/sub x/ process that is being developed by the Japanese boiler manufacturers as a new low-NO/sub x/ combustion technology is also briefly discussed. 8 references, 27 figures, 9 tables.

(Energy and Environmental Research Corp., Irvine, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Data is presented from a series of bench scale experiments in both gas and coal fired reactors to investigate the effectiveness of the reburning process for NO/sub x/ control. The results indicate that a reduction of 50 percent is possible using both gas and coal as the reburning fuel in agreement with Japanese studies. However, for reburning fuels containing high levels of fuel nitrogen, excessive quantitites of reburning fuel can cause an increase rather than a decrease in emissions. Coal properties also affect carbon burnout under reburning conditions. Further investigations are required to establish the impact of mixing rates and coal types on the reburning process and to determine the times and temperatures which must be achieved in practice for optimum NO reduction. 7 references, 11 figures, 1 table.

32575 (EPRI-CS—3182-Vol.1, pp 17.1-17.19) **Fuel staging for pulverized coal furnace NO/sub x/ control.** Kelly, J.T.; Pam, R.L.; Suttmann, S.T. (Acurex Corp., Mountain View, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

A 16.1-kW idealized subscale combustor was used to define the NO/sub x/ emission control benefits of fuel staging. NO/sub x/ control is achieved by injecting coal, as well as combustion air, at two locations in the combustor. The NO/sub x/ and combustion product gases from the first-stage flame are mixed with fuel and air in the second stage and reburned. The fuel fragments, fuel nitrogen components, soot and char produced by the reburning interact with the previously formed NO/sub x/, reducing it to low levels within a fraction of a second. This combustion modification approach has lowered NO/sub x/ by over 70 percent from baseline levels. Current test results show that second-stage stoichiometry is a dominant process variable, and that effective NO/sub x/ reduction requires that the second stage be operated fuel rich. First- and third-stage stoichiometries and fuel fraction injected into the second stage were less important to the process, as long as the second stage was operated under fuel-rich conditions. Based on the test results of this study, process variable regimes were identified where fuel staging has a distinct advantage in controlling NO/sub x/ emissions over classical staging. These are cases where the first stage is operated fuel lean and the second stage is operated fuel rich. 7 references, 8 figures, 2 tables.

32576 (EPRI-CS—3182-Vol.1, pp 19.1-19.17) **Review of in-furnace NO/sub x reduction and SO/sub x/ reduction by sorbent injection.** Breen, B.P.; Gabrielson, J.E. (Energy Systems Associates, Tustin, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

The technological development of the process known variously as in-furnace NO/sub x/ reduction, reburning, and/or fuel staging is discussed. a review of past work where NO/sub x/ that had been formed in flames was subsequently eliminated by reacting with fuel is included. Work on gasifiers, combined cycles employing gas turbines with fired boilers, experimental burners, boiler simulator, a full-scale utility boiler, and cement kilns has contributed to the understanding. Various United States and foreign organizations have made contributions to the development of the process. Practical aspects of furnace design impact the pollutant reduction technologies because of limitations due to heat transfer surface, volume, and temperature requirements. How in-furnace NO/sub x/ reduction can be adapted to cyclone, tangential, and opposed-fired boilers is discussed, along with the potential impacts of individual boiler design factors and fuel characteristics. In-furnace NO/sub x/ reduction has been experimentally measured with pulverized coal, oil, or gas used as the additional fuel. Possible implementation techniques are discussed. Coal is, by far, the most economical fuel, but may restrict the technique because of primary coal transport, injection difficulty, carbon carryover, or a limited amount of NO/sub x/ reduction achieved. 9 references, 7 figures.

32577 (EPRI-CS—3182-Vol.1, pp 20.1-20.18) **Dry additive process for the reduction of SO_2 emission in brown coal fired boilers.** Hein, K.R.G. (Rheinisch-Westfaelisches Elektrizitaetswerk AG, Essen, Germany). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

A flue gas desulfurization process using dry calcium-based materials as additives with the fuel has been proposed based on the results of combustion trials with Rhinish brown coals. The applicability of the process was evaluated in a brown coal fired utility boiler (175 ton/hr steam production) over several years. The first results of this project were published in 1978 (1) and 1981 (2). In the meantime, a detailed research program has been carried out in order to reduce the amount of additive necessary to provide a given SO_2 reduction. 3 references, 11 figures.

32578 (EPRI-CS—3182-Vol.1, pp 21.1-21.21) **Operation and performance report of the Steinmueller low NO/sub x/ SM-burner and its potential towards utility boiler SO/sub x/-control via sorbent injection.** Chughtai, M.Y.; Michelfelder, S.; Leikert, K. (L & C Steinmueller GmbH, Gummersbach, Germany). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Following the successful pilot plant tests the combustion equipment of a 700 MW coal fired power station was changed to staged mixing burners (SM-burners). Both, to ease the retrofit and to safely allow the execution of a measuring program as retrofit burners a modified version of the experimentally optimized SM-burner design was used for the boiler. In spite of the narrower operational limits of the modified SM-burner the goal of a 50 % NO/sub x/ reduction was met in the boiler demonstration tests. Furthermore a burner load dependent automatic secondary/tertiary air flow control system developed to guarantee a safe burner operation at low NO/sub x/ levels over a wide turn down ratio, was introduced successfully. In the past 42 months of operation neither short term nor long term performance problems due to low NO/

sub x/ operation could be detected. Earlier successful experiments with Calcium-based sorbent addition to lignite for SO_2 absorbtion during combustion initiated a further development step for the SM-burner concept towards its application for an in situ desulfurization process. A prototype de NO/sub x/-de SO/sub x/ SM-burner has been successfully tested on a pilot scale at the International Flame Research Foundation with high calorific value fuels as coal, heavy fuel oil and natural gas. Presently a demonstration program is under way to define the potential problem areas to be taken account of in the process application for coal fired steam generators. 11 references, 9 figures.

(Acurex Corp., Mountain View, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

A tangentially fired, pilot-scale combustor is being used to determine the potential of a low-NO/sub x/ air-on-wall combustion modification technique to simultaneously reduce SO/sub x/ emissions through a dry sorbent injection technique. The pilot-scale facility has been designed to simulate fuel/air mixing and bulk gas heat transfer events characteristic of full-scale tangentially fired utility boilers. The results from the initial phase of the program, baseline NO/sub x//SO/sub x/ testing, are described in the paper. The baseline testing discussed here was carried out under the conventional tangential burner configuration. The gas temperature profile measured in pilot scale is shown to agree satisfactorily with full-scale data. Also, NO/sub x/ emisson levels from the pilot-scale facility are in excellent agreement with those of full scale. Dry sorbent injection tests were conducted to show the effect of SO/sub x/ reduction as a function of sorbent injection concentration, excess air, furnace load, sorbent injection location, sorbent type, and coal type. The trends observed in the dry sorbent injection tests are consistent with past studies. Actual SO/sub x/ reduction levels achieved are also similar. The effect of overfire air addition on dry sorbent injection is briefly discussed. 21 references, 17 figures.

(Combustion Engineering, Inc., Windsor, CT; Electric Power Research Inst., Palo Alto, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

A four-phase program under EPRI sponsorship to determine the engineering and economic feasibility of dry sorbent injection for control of sulfur dioxide emissions has been completed. A survey of available literature on dry sorbent injection for sulfur control was performed which was supplemented by laboratory ash fusion temperature tests of selected coals at several Ca/S ratios. The information generated from these studies formed the basis for an engineering feasibility and an economic impact analysis for both new and retrofit utility boiler applications. An analysis of sixteen case studies was performed relating Ca/S and coal sulfur content to boiler design and dry sorbent system costs. The analysis showed that dry sorbent injection is feasible from an engineering point with levelized costs of 1 mills/kWh to 14 mills/kWh depending on the coal sulfur content and the Ca/S molar ratio. 11 figures, 4 tables.

32581 (EPRI-CS—3182-Vol.1, pp 24.1-24.15) **IERL-RTP research on sulfur capture in LIMB.** Borgwardt, R.H.; Gillis, G.R.; Roache, N.F. (Environmental Protection Agency, Research Triangle Park, NC; Northrop Environmental Services, Inc., Research Triangle Park, NC). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

EPA's in-house laboratory studies of gas/solid reactions that are expected to contribute to sulfur capture in the limestone injection multistage burner (LIMB) is discussed. The research is aimed at an improved understanding of variables that determine the rate of reaction and ultimate conversion of limestone when injected into the reducing or oxidizing zone of the burner. Current work is focused on reactions which may occur in the first stage of the LIMB to form CaS. Initial results of bench-scale studies using differential and entrained-flow reactors are presented, including the reaction of H_2S with $CaCO_3$, the calcination of $CaCO_3$ to CaO, and the reaction of H_2S with CaO. 7 references, 14 figures.

(Environmental Protection Agency, Research Triangle Park, NC; Radian Corp., Austin, TX). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Nitrogen oxide (NO/sub x/) emissions from stationary sources may be reduced by 80 to 90 percent through the application of selective catalytic reduction (SCR) of NO/sub x/ with ammonia (MH_3). For the most part, SCR has been developed and commercially applied in Japan. In the interest of evaluating SCR technology in the US, EPA has sponsored pilot-scale tests of two SCR systems treating flue gas from coal-fired boilers. The processes tested were the Hitachi Zosen process and the Shell Flue Gas Treatment (FGT) process, which also removes sulfur dioxide (SO_2). The results of those tests show that both processes tested are technically capable of reducing 90 percent of the NO/sub x/ in flue gas which contains the full particulate concentration from a coal-fired boiler; however, the performance of the Shell process was generally below this level. A sampling program conducted during the pilot plant tests showed no adverse secondary emissions from application of the SCR processes; however, high NH_3 and sulfur trioxide (SO_3) emissions are a concern due to their potential for causing operational problems in downstream equipment. Cost projections, which are based on pilot plant results, show that the Hitachi Zosen process combined with a conventional flue gas desulfurization process should cost less than the Shell process for control of both NO/sub x/ and SO_2 emissions. 3 references, 2 figures, 7 tables.

(KVB, Inc., Irvine, CA; Electric Power Research Inst., Palo Alto, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Ammonia-based selective catalytic reduction (SCR) has been proposed as a means of reducing NO/sub x/ emissions from coal-fired utility boilers well below current federal standards. EPRI is conducting a technical evaluation of the SCR process on a 5000 scfm pilot-scale facility at the EPRI Arapahoe Test Facility. The

pilot-scale system treats a 5000 scfm slipstream of flue gas (2.5 MWe equivalent) from Arapahoe Unit 4 which fires a western low sulfur coal. In addition to the SCR reactor, the system includes a regenerative air heater to assess impacts on air heater performance. The results obtained during a one-year test program are presented. These include: (1) the process performance (NO/sub x/ removal); (2) impacts of secondary emissions, including ammonia, SO_3, and ammonium/sulfate compounds; (3) impacts of increased SO_2 levels; (4) impacts on the air preheater due to deposit buildup; and (5) evaluation of the SCR process requirements, including the ammonia injection controls, and the performance and maintenance of flue gas monitoring systems. 9 figures, 3 tables.

32585 **(VTT-TUTK—231) Emission inventory of coal, peat and oil-fired power plants.** Pohjola, V.; Hahkala, M.; Haesaenen, E. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Oct 1983. 58p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland.

Measurements were carried out of the emission of SO/SUB/2, NO/SUB/x fly ash, heavy metals and radioactive elements from eight power plants and district heating plants burning coal, peat or heavy fuel oil. In addition PAH-emissions were measured in the case of one coal-fired and three peat-fired plants, and the following emissions were also measured from one peat-fired plant: total hydrocarbons, aldehydes, benzene, toluene, xylene as well as the metals lead, cadmium and mercury in the gaseous phase. The mutagenicity of the stack gases was investigated using stack gas samples from one coal-fired, one oil-fired and three peat-fired plants. Samples were taken from the fuel and from both bottom ash and fly ash for elemental anlysis. Elemental concentrations of imported coal and fuel oil as well as of the peat fuel were monitored over an extended period of time. The results obtained indicated that the SO/SUB/2 emissions per unit of fuel energy in the case of oil were 2-3 times greater than the corresponding emissions from coal and as much as 6-9 times greater than from peat. Emissions of nitrogen oxides from the burning of coal were on average double those from peat and threefold in comparison with the corresponding emissions from oil. Characteristic fly ash emission from the combustion of coal was about three times greater than from peat burning. Fly ash emissions from the burning of fuel oil were about half those from coal when the fly ash collection efficiency in conjunction with coal burning was 99%. Characteristic emissions of heavy metals were greatest in the combustion of coal, with the expection of vanadium and nickel of which the greatest emissions were from oil. PAH-emissions were similar in the combustion of both coal and peat. Slight mutagenicity of the stack gases from coal- and peat-fired power plants was demonstrated.

32586 **(CSIRO-DAG-GCM—53) CSIRO horizontal borehole inclinometer - description and operation.** Gravina, J.; Carson, G.H. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Applied Geomechanics). 1983. 18p. Commonwealth Scientific and Industrial Research Organisation, Div. of Applied Geomechanics, Mount Waverley, Australia.

This report describes a prototype horizontal borehole inclinometer probe, signal conditioning, and control unit. The probe is designed to operate inside AQ size (35 mm internal diameter) drill rods, has a range of +/- 40 degrees and a sensitivity of 5 minutes of arc. The novel, remote controlled, self-orientating feature of this probe enables convenient tracking of vertical displacements in horizontally drilled boreholes. In addition, the hand-held battery driven control and monitoring system has been designed as intrinsically safe for use in hazardous methane environments, making the instrument particularly suited to surveying gas drainage holes in coal mines, during the drilling process.

32587 **(PB—84-163005) Geophysical techniques for coalbed evaluation. Final report Apr 82-Dec 83.** Kern, J.W.; Sinha, A.K.; Sookram, V. (Dresser Petroleum Engineering Services, Houston, TX (USA)). Dec 1983. 111p. NTIS, PC A06/MF A01.

Methane produced from coalbeds is a potentially significant source of natural gas. The determination of gas potential will be aided if geophysical logging can determine the gas production potential of reservoirs. The purpose of this work was to define geophysical logging methods for identifying and evaluating the methane content of coals. The work was organized into the following tasks: (1) identify the instruments which define coal and coalbed methane characteristics; (2) define the expected utility of these instruments; (3) develop algorithms to assess the methane content of coalbeds; (4) coordinate logging test programs through GRI; and (5) perform field tests on wells of opportunity for verification of log interpretation methods.

32588 **(PB—84-172352) Clay-mineral assemblages in Upper Cretaceous shales in the Torreon Wash and Star Lake coal areas, southeastern San Juan Basin, New Mexico. Open file report (final).** Bodine, M.W. Jr. (New Mexico Inst. of Mining and Technology, Socorro (USA)). Dec 1983. 76p. NTIS, PC A05/MF A01.

This project was undertaken to characterize the mineralogy and chemical composition of clay mineral assemblages in Upper Cretaceous shales in the southeastern part of the San Juan Basin in northwestern New Mexico and to determine their relations with episodes of coal deposition. The shales represent a range of depositional environments from marine, through near-shore mixed marine and continental, into fluvial and aeolean continental. Coal accumulation in the Torreon Wash and Star Lake areas occurs in both mixed marine and continental and fluvial continental facies.

32589 **(ACIRL-PR—83-10) Experience from initial longwalling at West Cliff Colliery.** Schaller, S. (Australian Coal Industry Research Labs. Ltd., North Ryde). Oct 1983. 57p. Australian Coal Industry Research Labs. Ltd., North Ryde.

As part of a current project conducted by Australian Coal Industry Research Laboratories Ltd. (ACIRL) to investigate feasibility design and operation aspects of longwall mining, field research was carried out at West Cliff Colliery. This report contains an analysis of the results obtained from geotechnical monitoring during a total 650 m retreat of Longwall 1. The initial geomechanical environment was established by monitoring stress changes and deformation developments in the roadways and chain pillars, and loads arising from massive overburden strata on chock-shields of 900 tonne capacity. The problems associated with high methane emissions (of the order of 50 to 150m/SUP/3/min) were greatly reduced by the existing gas predrainage system. (7 refs.)

32590 **(ACIRL-PR—83-11) Experience with initial longwalling at John Darling Colliery.** Schaller, S. (Australian Coal Industry Research Labs. Ltd., North Ryde). Oct 1983. 65p. Australian Coal Industry Research Labs. Ltd., North Ryde.

Strata response in and around Longwall 1, operating in the borehole seam, John Darling Colliery, was investigated. Brittle fracture behaviour of the roof was encountered in the gate roads. Installation and operation of two leg shields of 450 t capacity, used for the first time in Australia, was successful. Within the limitations imposed by the tectonic zones, confining the width of Longwall 1 Block to 67 m, the average longwall production was 20,000 t/week. A record production of 7806 t was achieved during one particular day and advance of 12 m in one shift. Other main features of the operations were: 1. Subsidence at the surface of less than 5% of the extraction height (of 2.4 m) proved to be no hazard to longwalling under the sea bed. 2. Yield pressures of 50 MPa were frequently recorded being the result of dynamic roof loads developed when the supporting units were moved forward. 3. The roof was sound along the face line with the Westfalia shields maintaining the settling and increased hydraulic pressures reliably. (5 refs.)

32591 **(CSIRO-DAG-GCM—51) Dual-channel microseismic monitor for use in gassy coal mines.** Carson, G.H.; Gravina, J.; Arnold, L.N. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Applied Geomechanics). 1983. 47p. Commonwealth Scientific and Industrial Research Organization, Div. of Applied Geomechanics, Mount Waverley, Australia .

This report details the current state of development and application of a prototype dual-channel microseismic monitoring unit. This intrinsically safe unit was designed for installation at the mine face in coal mines subject to outbursts of gas and coal. The rate of microseismic emissions resulting from stress redistributions within the geological materials into which the probes of the monitor are mounted, can be analysed for characteristic signatures which may warn of an impending failure of the material. The principle of operation of the monitor, its current electronic design and the characteristics of its performance are considered in some detail. The means of collecting, recording and analysing the data are set out along with some exemplifying results from a field experiment. Some consideration is given to the next stage of development of the equipment. (3 refs.)

32592 **(CSIRO-DAG-GCM—52) Multi-stage probe for monitoring coal seam gas pressures and flows.** Skarajew, W. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Applied Geomechanics). 1983. 7p. Commonwealth Scientific and Industrial Research Organisation, Div. of Applied Geomechanics, Mount Waverley, Australia.

The measurement of gas pressures and/or flows in coal seams is an essential step in the planning of coal seam gas drainage schemes. Gas drainage can help to reduce the risk of outbursts in coal mines and may represent a potentially significant source of energy. This report describes the design, construction, and proof testing of a multi-stage probe for monitoring gas pressures and flows in coal seams.

32593 **(CSIRO-DAG-TR—40) Load transfer behaviour between steel reinforcement and cement based grout.** Cox, R.H.T.; Fuller, P.G. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Applied Geomechanics). 1977. 31p. Commonwealth Scientific and Industrial Research Organisation, Div. of Applied Geomechanics, Mount Waverley, Australia.

Pullout tests have been performed on single high tensile steel wires and prestressing strands embedded in columns of cement-based grout. The investigation demonstrated the significance of the grout strength and the embedment length, surface condition and external geometry of the reinforcement on the load transfer between the reinforcement and the grout. The stiffness of the grout reinforcement system under load is found to be influenced by both the surface condition of the reinforcement and the grout strength until relative movement between the reinforcement and the grout has taken place at all points along the embedded length. At this stage the load transfer also becomes dependent upon the external geometry of the reinforcement and its embedment length. As the relative displacement between the reinforcement and the grout increases, the grout strength remains a major parameter in the load transfer and the importance of the surface condition of the reinforcement diminishes.

32594 **(CSIRO-DAG-TR—41) Plug and collar anchor to transmit load from a strand to a thrust plate.** Fuller, J.G.; Cox, R.H.T. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Applied Geomechanics). 1977. 53p. Commonwealth Scientific and Industrial Research Organisation, Div. of Applied Geomechanics, Mount Waverley, Australia.

A need exists for the provision of a simple device to be attached to the steel reinforcement on long bolts or dowels in order to support exposed rock in the backs (roofs) of temporary underground openings. An anchorage device for use with 12.5 mm diameter prestressing strand has been developed for this purpose. Details of the anchor design and operating principles are described and the performance of anchors of slightly different design is compared and discussed. Load transfer between 75 and 135 kN is possible with this anchorage system and support can be maintained for relative movements between the rock and reinforcement of up to 120 mm.

32595 **(DOE/FE/00016—T39) Longwall dust control field tests.** (Foster-Miller, Inc., Waltham, MA (USA)). 14 Jun 1984. Contract AI01-81FE00016. 15p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012952.

Following are highlights of the observations and conclusions drawn from the certain field tests: The use of Kaiser's wing curtain significantly reduced the average air velocity around the face corner, particularly when the gob curtain was removed (Kaiser's existing procedure). The velocity reduction will result in a lessened tendency for headgate cutout dust to be blown directly into the walkway negatively impacting the operator's exposure. Dust will be more effectively channeled around the face corner and downstream past the shearer body. At shield No. 10, average air velocities were within 15 percent of each other over all four of the curtain configurations tested. This indicated that curtain usage had a minimal effect on airflow levels along the face for Kaiser's given condition of gob consolidation. The high air velocity (spot) readings occurring just downstream of the installed wing curtain were due to leakage through gaps in the curtain around the stageloader. The volume of leakage was not significant, but proved to be helpful in sweeping the downstream headgate region clean of contaminants and preventing recirculation. Kaiser's curtain system design has proven to be very rugged, practical and effective and would be suitable for use in many coal mines. Used in conjunction with the semipermanent stageloader curtain, the wing curtain can remain in position for nearly 30 to 40 feet of face advance before needing to be repositioned. The stageloader curtain itself could be mounted directly to the stageloader for automatic advance with headgate equipment. This would only be feasible if the headgate roof horizon was consistent. Kaiser currently hangs the curtain independently and repositions it as required.

32596 **(PB—84-159375) Development of coal-gas production simulators and mathematical models for well test strategies (computer models for single- or two-phase flow of methane and water in heterogeneous coal seams to a single, vertical production well connected to a finite conductivity vertical fracture). Topical report Aug 81-Oct 82.** Ertekin, T.; King, G.R. (United States Steel Corp., Monroeville, PA. Research Lab.). Jul 1983. 493p. NTIS, PC A21/MF A01.

Prepared in cooperation with Pennsylvania State Univ., University Park, Dept. of Mineral Engineering.

A series of unique, computer-based, finite-difference models for the production of methane from coal seams by vertical wells are presented along with FORTRAN source codes. Included in this series are single-phase (gas), one-dimensional; two-phase (gas-water), one-dimensional; and two-phase (gas-water), two-dimensional models for a single vertical production well. The two-phase, two-dimensional model allows for a single, infinite- or finite-conductivity, vertical fracture extending radially from the wellbore. The natural fracture network (butt and face cleat) of the coal seam has been identified with a porous network and assigned an effective porosity and absolute permeability. A time-dependent source term, based on a first order kinetic model and a Langmuir equilibrium sorption isotherm is used to describe gas desorbing from the coal matrix into the porous network.

32597 **(PB—84-159441) Water infusion - an effective and economical longwall dust control. Report of investigations/1983.** Cervik, J.; Sainato, A.; Baker, E. (Bureau of Mines, Pittsburgh, PA (USA). Pittsburgh Research Center). 1983. 21p. (BM-RI—8838). NTIS, PC A02/MF A01.

Library of Congress catalog card No. 83-600307.

This Bureau of Mines report describes the technology for infusing water into a longwall panel and reports the results of a recent demonstration in the Lower Sunnyside Coalbed that achieved dust reductions averaging 58 pct. Because water infusion increases moisture content of the coalbed, face air velocities in excess of 500 ft/min (2.5 m/s) are possible, further diluting dust levels before dust entrainment occurs. An economic analysis shows a 23-pct reduction in operating costs when coal production is increased by changing from unidirectional mining to bidirectional mining with water infusion.

32598 (PB—84-159508) Laboratory testing of compressed-oxygen self-rescuers for ruggedness and reliability. Report of investigations/1983. Kyriazi, N.; Kovac, J.; Duerr, W.; Shubilla, J. (Bureau of Mines, Pittsburgh, PA (USA). Pittsburgh Research Center). 1983. 24p. (BM-RI—8839). NTIS, PC A02/MF A01.

Library of Congress catalog card No. 83-18972.

The Bureau of Mines subjected three commercial compressed-oxygen self-contained self-rescuers to a series of laboratory treatments designed to simulate various environmental conditions in underground coal mines. The environmental treatments consisted of extremes of temperature and of shock and vibration. The tests were designed to predict the ability of the self-rescuers to withstand those environmental stresses without causing a decrease in wearer protection. A critical concern was internal damage to an apparatus that would cause it to malfunction or seriously degrade its performance without any obvious external signs.

32599 (PB—84-159540) Control of longwall gob gas with cross-measure boreholes: Upper Kittanning Coalbed. Report of investigations/1983. Campoli, A.A.; Cervik, J.; Schatzel, S.J. (Bureau of Mines, Pittsburgh, PA (USA). Pittsburgh Research Center). 1983. 24p. (BM-RI—8841). NTIS, PC A02/MF A01.

Library of Congress catolog card No. 83-600321.

The cross-measure borehole technique is being studied by the Bureau of Mines as an alternative to the use of surface gob boreholes as a means of controlling methane in gobs during longwall mining. Small-diameter holes are drilled from underground locations into strata overlying the mined coalbed. When the roof strata are fractured by the mining operation, a partial vacuum applied to the boreholes draws the methane out of the fractured strata and prevents it from entering the mine ventilation system. Tests in the Upper Kittanning Coalbed showed that 50 pct of the methane produced by the longwall mining operation was captured by the cross-measure boreholes. Borehole inclination and penetration into the gob are two important borehole parameters that affect the performance of the cross-measure borehole system.

32600 (PB—84-164250) Ergonomic principles of colliery control room design and layout. Mason, S.; Simpson, G.C.; Best, C.F. (Institute of Occupational Medicine, Edinburgh (UK)). May 1983. 50p. (TM—82/8D). NTIS, PC E04/MF E04.

This report deals only with hardware design. Although the advent of computer-based systems has emphazised the need for a careful consideration of ergonomic factors, the installation of such systems is extremely costly and the development process lengthy. It is not uncommon, therefore, to find in all industries a transition period where computer-based systems are introduced alongside conventional instrumentation for the control and monitoring of other operations. This report includes, therefore, a number of sections covering the ergonomic principles of conventional control room instrumentation as well as those relating to computer systems. The aim of this report is to provide information specifically for a given area in order to enable ergonomic considerations to be included in the design process without the necessity of involving ergonomists.

32601 (PB—84-166180) Noise control of rubber-tired front-end loaders used in surface mining. Open file report 13 Apr 79-31 May 83. Dixon, N.R.; Thompson, A.R. (Bolt, Beranek and Newman, Inc., Cambridge, MA (USA)). Jun 1983. 54p. NTIS, PC A04/MF A01.

The objectives of this program were to assess and demonstrate retrofit noise control technology for front-end loaders. The treatments had to be practical, cost-effective, and able to be easily installed by mine personnel. Two loaders, a Caterpillar 988 and an International H-400B, were chosen for the program and the noise sources and acoustic paths that contribute to the operator's noise exposure were identified. Retrofit noise control treatments were designed and installed on the loaders, and noise reductions of more than 10 dBA at the operator position were achieved on both machines. The retrofit packages are low cost and have been field tested in two mines for more than 2 yrs. The results of the program were communicated to the mining industry through a series of noise control workshops and a field manual. The workshops were given in nine States across the United States and more than 440 manuals were distributed to attendees. An audiovisual slide presentation was also developed that summarizes the program.

32602 (PB—84-166370) Influence of rock discontinuities on coal mine subsidence. Open file report 29 Sep 80-10 Sep 83. O'Connor, K.M.; O'Rourke, J.E.; Carr, J. (Woodward-Clyde Consultants, Walnut Creek, CA (USA)). 10 Sep 1983. 130p. NTIS, PC A07/MF A01.

This report documents the process of literature review, site selection, instrument installation, data acquisition, and preliminary data reduction performed to evaluate the influence of rock mass discontinuities on coal mine subsidence. A system of surface, subsurface, and mine level instrumentation was installed at the Armco No. 7 Mine in Montcoal, WV, where the overburden ranged from 630 to 1,040 ft thick. Survey monuments, borehole pressure cells, full profile borehole inclinometer-extensometers, mine level extensometers, stressmeters, and tape extensometer convergence stations were installed to monitor displacements and stress changes. Final design of the instrumentation system was based on (1) review of available information, (2) field mapping and analysis of areal photography, (3) drilling, and (4) borehole geophysics. The report contains the complete graphed data of stress and displacements accompanying the longwall mining of a 4,800-ft-long by 480-ft-wide coal panel.

32603 (PB—84-173756) Development and analysis of slurry transport systems in longwall mining of coal. Open file report 30 Sep 81-21 Sep 82. Yegulalp, T.M.; Knight, R.C.; Marchi, N. (Columbia Univ., New York (USA). Trustees). 30 Sep 1982. 128p. NTIS, PC A07/MF A01.

A preliminary systems analysis of coarse-particle coal slurry pipelines as a haulage method for longwall mining systems was performed. Two exhaustive literature surveys on state-of-the-art longwall mining and slurry transport technologies were prepared. Two representative longwall systems were designed, one with conventional haulage and one with slurry haulage. The two systems were then compared on the bases of cost, safety, and reliability. It was concluded that for the case of a two-face longwall mine, a coarse slurry transport system does not have a clear-cut cost advantage over a conventional (conveyor-hoist) system. However, indications were that a cost advantage could occur under different analytical conditions such as (1) a larger scale mine, (2) if intangible benefits were quantified, and (3) if new generation technology rather than currently available technology were applied to the study.

32604 (TCCR—84-003) Evaluation of coal winning technology - an assessment of the National Coal Board's technological developments. Jones, A.D.W.; Quinn, J.J.; Woolley, K.M. (National Coal Board, London (UK). Technical Change Centre). Jan 1984. 93p. National Coal Board, Technical Change Centre, London, England.

This report is the outcome of a study of the state of technology and its application within the NCB, and concentrates on the technology of coal winning at the face line on longwall faces using shearing machines. Productivity is studied in terms of output per machine shift, and the improvement at the coal face resulting from technological developments is compared to that elsewhere below ground. At the face, output improvements are assigned to changes in the dimensions of the coal face worked by the shearer, and to greater labour and management efficiency. Improvements of roof supports, better controlled shearers, and greater available power at the face have helped to increase productivity. The study showed that improvements at the coal face and surface since 1976 have not been matched by improvements elsewhere below ground, but this is a result of the NCB's allocation of its development effort. To reallocate some resources would be one method of improving total productivity. The report describes the technological developments in coal winning, and covers aspects of health and safety, costs, productivity data, and research and development. (6 refs.)

32605 (ANL/ER-TM—84-1-Vol.2) Freight Network Modeling System. Volume II. Freight Network Equilibrium Model: Version 4.1 User's Guide and Programmer's Guide. (Argonne National Lab., IL (USA)). Apr 1984. Contract W-31-109-ENG-38. 184p. NTIS, PC A09/MF A01; 1; GPO Dep. Order Number DE84013273.

Portions are illegible in microfiche products.

This volume contains an explanation of how to use the Freight Network Equilibrium Model, Version 4.1 (FNEM-4.1). It does not, however, contain any explanation of the model's theoretical basis, which is covered in Volume I, or of the use of preprocessor programs to prepare the data files, which is covered in Volume III. The User's Guide (Sec. 3 of this volume) includes thorough descriptions of all necessary input data, as well as an interpretation of the output. A small, but comprehensive, test problem is used to illustrate nearly all features of the model and to provide specific examples of the input/output. The Programmer's Guide (Sec. 4) is intended for use by the systems professional. The overall program logic of FNEM-4.1 is outlined, and for each subroutine the argument list, calling sequence, purpose, and method are summarized. Important variables and arrays are defined, error messages are discussed, and listings of actual job control language are presented.

32606 (ANL/ER-TM—84-1-Vol.5) Freight Network Modeling System. Volume V. Flexible Network Definition Software User's Guide. (Argonne National Lab., IL (USA)). Apr 1984. Contract W-31-109-ENG-38. 44p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013445.

This volume is a user's guide for the flexible network definition software that allows the user to manipulate the basic data files to design a network suitable for a particular study. The flexible-network software allows the user to automatically define study regions of any size (county to multi-state) and to use different levels of transportation network detail within each region. This allows the user to model a completely detailed transportation network in the regions of primary interest while modeling movements to and from these regions on an aggregate network in the surrounding regions, thus reducing computational requirements. Because of this flexibility and the numerous support data bases, the flexible network definition capability makes it easy to set up the Freight Network Equilibrium Model (FNEM) or the Shortest Path Analysis and Display (SPAD) program for a new study. The network data bases include data on the rail, highway, water, and pipelines systems in the United States. FNEM is a predictive model that simulates the decisions of both shippers (buyers and sellers of goods) and carriers (rail, truck, and barge operators) and takes into account the competition for transportation facilities and congestion delays caused by all freight movements. The Model produces as output detailed routings, cost estimates, and delay estimates for all shipments and total traffic levels on all facilities.

32607 (DOE/ET/10598—T1) Simplex coal and biomass gasification process. Phase II-C. Demonstration of Bepex briquetting process properties of commercial Simplex briquettes. Arbo, J.C.; Schon, S.; Schulz, H.W. (Columbia Univ., New York (USA). Fossil Energy Lab.). 31 Mar 1979. Contract AS01-77ET10598. 69p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013689.

Portions are illegible in microfiche products.

The technical feasibility of adapting the high-speed rotary press to the production of Simplex briquettes was successfully demonstrated. More than 50,000 2" X 2" pillow-shaped briquettes were produced comprising six Simplex formulations of immediate interest to the Phase II-D Simplex Development Program. The operating results confirm that the briquetting operation can be implemented commercially at an economic cost. The commercially produced batches of briquettes were characterized and evaluated by subjecting representative samples to a battery of mechanical tests which had been previously developed to determine the structural integrity and caking propensity of Simplex briquettes in the environment they will encounter in gravitating through the shaft furnace during gasification. The test results are presented and discussed in Part I of this report. Part II documents the formulations and raw materials employed in producing the six batches of briquettes for the semi-continuous, steady-state runs to be conducted in Phase II-D. The entire briquette inventory was shipped to the Fossil Energy Laboratory at Columbia. During the experimental operation of the Bepex rotary press it was observed that the productivity of this machine could be substantially improved if the feed mixture were precompacted to counteract the fluffy nature of the RDF. The Bepex management indicated that an effective precompaction device could be designed and constructed at a cost of $50,000. Given such an improved feed mechanism, it was estimated that the productivity of the rotary press might be increased three to five-fold. 11 figures, 10 tables.

32608 (IS-M—462) Sulfur species leached from pyrite during oxidative desulfurization of coal in alkaline solutions. Stephenson, M.D.; Wheelock, T.D.; Markuszewski, R. (Iowa State Univ. of Science and Technology, Ames (USA)). 1983. Contract W-7405-ENG-82. 4p. (CONF-830807—15). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012135.

From International conference on coal science; Pittsburgh, PA, USA (15 Aug 1983).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The results indicate that thiosulfate, sulfite, and sulfate are the principal soluble sulfur species produced when coal-derived pyrite leached with a hot alkaline solution containing dissolved oxygen. The distribution of soluble sulfur species in the leachate was found to depend on leaching temperature, oxygen partial pressure, leachant composition, and time of contact. At lower temperatures and oxygen partial pressures and with a short time of contact between the leaching solution and pyrite, the leachate sulfur species were dominated by thiosulfate. However, the leachate also contained significant amounts of sulfite and sulfate. When the temperature, oxygen partial pressure, or time of contact were increased, the proportions of thiosulfate and sulfite decreased and the proportion of sulfate increased. It was observed also that reacted pyrite particles catalyzed the oxidation of thiosulfate to sulfite and sulfate. Consequently when pyrite was oxidized in a stirred reactor for 1 h at elevated temperature and oxygen partial pressure, most of the dissolved sulfur appeared as sulfate and very little as thiosulfate or sulfite. 10 references, 4 figures, 1 table.

32609 (NCB-YRL—16418) Potential for sulphur reduction by coal preparation of the R.O.M. coal at Prince of Wales Colliery, North Yorkshire Area. (National Coal Board, Rotherham (UK). Yorkshire Regional Lab.). Nov 1983. 7p. National Coal Board, Yorkshire Regional Lab., Rotherham, England.

This report gives the results of an analysis of the float and sink characteristics of the R.O.M. coal from the Prince of Wales Colliery, North Yorkshire. This colliery was chosen because of its high sulphur content coal, as part of a national exercise in connection with the acid rain investigation.

32610 (NCB-YRL—16434) Distribution of pyrite and its liberation by crushing in the washed coal at Kellingley Colliery, North Yorkshire Area. (National Coal Board, Rotherham (UK). Yorkshire Regional Lab.). Nov 1983. 25p. National Coal Board, Yorkshire Regional Lab., Rotherham, England.

As part of an investigation into the occurrence of pyrite and its liberation by crushing, the washed coal products from Kellingley Colliery were subjected to a detailed study of the distribution of pyritic sulphur in the coal both before and after crushing.

32611 (NCB-YRL—16443) Potential for sulphur reduction by coal preparation of the R.O.M. coal at Manton Colliery, South Yorkshire Area. (National Coal Board, Rotherham (UK). Yorkshire Regional Lab.). 1983. 8p. National Coal Board, Yorkshire Regional Lab., Rotherham, England.

This report gives the results of an analysis of the float and sink characteristics of the R.O.M. coal from the Manton Colliery, South Yorkshire. This colliery was chosen because of its high sul-

phur content coal, as part of a national exercise in connection with the acid rain investigation.

Portions are illegible in microfiche products; EFP-81.

The Danish energy policy is to substitute oil fuels by coal, at least in larger industrial enterprises. The purpose of this investigation is to plan the future coal consumption, to calculate models for coordinated transportation systems and to establish coal quality requirements and handling equipment siting. The supply model comprehends: supplies, unloading, handling, storage and domestic transportation of coal. Coal quality required,Price loco Danish harbor etc. are considered. Gurnace equipment and corresponding coal comminution, flexibility and demand,And the now-existing infrastructure of coal distribution are analyzed. There is proposed a handling system of four coal qualities, covering any possible demand. For every coal-type there are given technical, economic and environmental data in a catalogue. A random average-size county has been chosen as an example and 9 various system proposals of coal handling and distribution for industrial purposes and district heating systems. Train, truck and ship transport costs have been compared for the assumed four coal-types and storage costs and safety (self-ignition prevention) evaluated. The simulated model proves usefulness of a control distribution network for coal supplies.

EFP-81.

The third volume of system investigation in coal transport problems consists of data sheets for 9 different solutions of combined coal-terminals/transport networks. Prices for presumed coal quantities,Wear-off and maintenance of technical means are evaluated. Socio-economic factors are considered in relation to the present supply situation.

32615 **(PB—84-166172) Noise control techniques for the design of coal preparation plants. Open file report Jun 80-Sep 82.** Rubin, M.N.; Thompson, A.R.; Cleworth, R.K.; Olson, R.F. (Roberts and Shaefer Co., Chicago, IL (USA)). Dec 1982. 136p. NTIS, PC A07/MF A01.

Prepared in cooperation with Bolt Beranek and Newman, Inc., Cambridge, MA.

The purpose of this work was to document the currently available noise control techniques that can be incorporated into new coal preparation plants during the design stage. This was accomplished by reviewing previous experience, conducting an extensive literature search, visiting operating coal preparation plants, and contacting various equipment manufacturers. The treatments addressed include equipment substitution, changes in plant layout, and retrofit treatments for existing equipment.

32616 **(PB—84-171347) Feasibility study of in-mine coal preparation facilities. Open file report 23 Sep 81-30 Sep 82.** (Dames and Moore, Park Ridge, IL (USA)). Oct 1982. 115p. NTIS, PC A06/MF A01.

Prepared in cooperation with Roberts and Schaefer Co., Chicago, IL.

This work examined the feasibility of in-mine coal preparation. The work included a survey of previous investigations and a preliminary analysis of the economic and technical feasibility on a selection of representative sites and degrees of cleaning. The preliminary analysis determined that in-mine preparation systems can be applied using currently available technology. The most likely mines for application will have shaft or slope access and be deeper than 500 feet. The refuse disposal systems technically feasible are (1) pneumatic placement of coarse refuse in room-and-pillar panels or longwall faces, (2) mechanical placement of coarse and fine fractions in room-and-pillar panels, and (3) hydraulic placement of fine fractions in room-and-pillar panels. The economic feasibility is much more dependent on the refuse disposal system than on the preparation system. It is estimated that the capital cost of an in-mine preparation and disposal system would be $6.00 per clean ton and the operating cost would be $1.24 per clean ton for a 1-million-clean-ton-per-year mine.

32617 **(CONF-840801—8) Theory of fine particle formation in coal combustion.** Ahluwalia, R.K.; Im, K.H.; Chuang, C.F. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 27p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84007524.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

A theoretical model of evolution of submicrometer ash particles in coal combustion has been formulated. The model describes the condensation of mineral matter vapor by solving the population balance equation which includes terms for homogeneous nucleation, heterogeneous nucleation (particle growth rate) and particle agglomeration. The homogeneous nucleation rate is calculated from modified classical nucleation theory, particle growth rate from conducting mass and energy balance on a droplet, and particle agglomeration is considered to be caused by Brownian motion. The condensation calculations are driven by the gas phase equilibrium chemistry of Na-K-S-Cl-Ca-Mg-Fe-Si-H-O-N-C system. As dictated by the equilibrium chemistry of coal combustion, at proper conditions of pressure and temperature, the model treats Na and K to condense out as Na_2SO_4 and K_2SO_4, Ca as CaO, Mg as MgO, Fe as FeO/Fe_2O_3, and Si as SiO_2. The model is partially validated by comparison against available laboratory data on ash nucleation in a laminar flow furnace. The model predicts an inverse relationship between the particle number density and initial concentration of mineral matter vapor. The number-averaged size of the particles, however, is found to be directly proportional to initial vapor concentration. 11 references, 6 figures.

32618 **(CONF-840805—13) Viscosity of synthetic coal ash slags.** Vorres, K.S.; Greenberg, S. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012093.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

A series of 21 synthetic coal ash slags were studied. It was observed that: (1) plots of the logarithm of viscosity versus temperature showed one or two straight line segments, indicating Newto-

nian behavior in the temperature range studied; (2) plots of the logarithm of the reciprocal of viscosity versus reciprocal of absolute temperature also showed one or two straight line segments, indicating one or two mechanisms were operative over the temperature range; (3) for three series, varying in SiO_2 content, those with the greatest SiO_2 content had the highest viscosities; (4) within a series of given SiO_2 content, those members with the highest Al_2O_3 content had the highest viscosity; (5) for slags exhibiting a transition in behavior, the transition temperature could usually be associated with a ternary eutectic temperature in the phase equilibrium diagram for the most closely related ternary system; and (6) many of the slags probably had a solid phase precipitating from the liquid phase during the cooling period before the transition temperature. 6 references, 6 figures, 2 tables.

32619 **(DOE/CS/40037—T17) Pulverized coal firing of aluminum melting furnaces. Final report.** Stewart, D.L. Jr.; Dastolfo, L.E. Jr.; DeYoung, D.H. (Aluminum Co. of America, Alcoa Center, PA. Alcoa Technical Center). Apr 1984. Contract AC07-78CS40037. 277p. NTIS, PC A17/MF A01; GPO Dep. Order Number DE84013093.

Significant progress has been achieved in the development of a desulfurizing coal combustion process by the Aluminum Company of America (Alcoa) in a research program funded by the United States Department of Energy. Conceptually, high sulfur coal is burned with additives in a staged cyclone combustor, such that sufficient sulfur to obviate products of combustion (POC) scrubbing is retained in the slag by-product. Bench scale studies conducted during the program have shown that 70% of the sulfur (2.65% sulfur coal) reports to the slag at equilibrium through a 25% addition of iron ore to the coal. Results obtained correlate with published data for similar slag at higher temperatures. In pilot scale combustion tests, equilibrium levels of coal sulfur were retained by the slag (11 to 14%). Equilibrium sulfur capture was limited by low particulate retention and operating temperature higher than optimal. Cost estimates for implementation of the process are included in this report. 28 references, 39 figures, 58 tables.

32620 **(DOE/FC/10614—T4) Fundamental combustion studies of low-rank coal slurries. Quarterly technical progress report. No. 1, March 1-May 31, 1984.** Germane, G.J.; Smoot, L.D. (Brigham Young Univ., Provo, UT (USA). Combustion Lab.). 15 Jun 1984. Contract AC18-84FC10614. 42p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013290.

This contract for fundamental combustion studies of low-rank coal slurries was initiated March 1, 1984. Slurries to be studied will be primarily those produced from steam-dried lignite processed by the Grand Forks Project Office. Contract work includes virgin coal and slurry characterization, slurry spray and atomization measurements, detailed mapping of combustion products and pollutants for low-rank coal slurries in a laboratory reactor, and comparison of results with computer model predictions and data obtained under similar conditions from combustion of high-rank coal-water mixtures. 14 references, 15 figures, 2 tables.

(Foster Wheeler Development Corp., Livingston, NJ (USA)). Jun 1984. Contract AC22-81PC40268. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013203.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The objective of this program is to examine slags formed as a result of firing coals with varying concentration levels, size distribution, and orientation of pyrite with regard to mineral matter in the coal in a laboratory furnace. The program tasks are: (1) selection of eight candidate coals; (2) chemical characterization of the coal samples and identification of the pyrite size, distribution, and orientation with respect to other mineral matter and concentration levels; (3) testing of the candidate coals in a laboratory furnace; (4) chemical and physical characterization of the slag and fly ash samples created by the impurities in the coal sample; (5) influence of coal beneficiation on furnace slagging; and (6) analysis of data and identification of parameters influencing the contribution of pyrite to slagging problems. Results of analysis of two coals, Illinois No. 5 Gallatin County, Illinois and Lower Kittaning Clarion County, Pennsylvania, are presented. Examination of the morphology of furnace slag deposited in the 100 lb/hr combustor, as well as industrial furnace, revealed reocurring crystals of iron of pyrite origin on the surface of the deposit. The cubic, octahedron and cubic/octahedron crystals are similar in size and structure to pyrite crystals occasionally found in coal. To characterize the morphology of pyrites within the coal samples of Illinois No. 5 and Lower Kittaning coals were examined using SEM and EDAX analysis. Results are presented of the types of minerals found. 10 figures, 3 tables.

32622 **(DOE/PC/50254—T7) Investigation of vaporization and devolatilization of coal/water mixtures. Seventh quarterly report, November 1, 1983-January 31, 1984.** Solomon, P.R.; Hamblen, D.G.; Markham, J.R. (Advanced Fuel Research, Inc., East Hartford, CT (USA)). 18 Jun 1984. Contract AC22-82PC50254. 25p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013179.

Portions are illegible in microfiche products.

The objective of this program is to develop the capabilities to predict the vaporization and devolatilization behavior of coal/water mixtures under conditions appropriate for spray combustion. The program is currently collecting data in an entrained flow coal reactor which has a fixed position, coal/water slurry spray injector and a movable product extractor. This reactor is being used to study the vaporization and pyrolysis of coal/water slurries. FT-IR is used for the analysis of the product gases, tars and chars to determine species evolution kinetics and kinetics of secondary reactions such as steam-char reactions, cracking, soot formation, char gasification, cenosphere formation and particle swelling, and char reactivity. Pyrolysis data for ARC prepared coal/water slurries were collected in the reactor system at furnace temperatures between 900 and 1500°C. The major physical effect of the water when slurry droplets are studied is agglomeration of coal particles to produce large char particles. The agglomeration appears to increase with increasing temperature but can be controlled under some conditions by using a coal which has reduced swelling behavior. There is evidence suggesting that the large agglomerates which have been observed are produced by collisions within the transfer tube through which the droplets enter the furnace. FT-IR techniques are being used to measure particle temperatures during pyrolysis and combustion. Measurements were made of char particle temperatures at several oxygen concentrations in the secondary gas. Measurements were also made to compare particle temperatures with and without water. The primary effect of the water appears to be to disburse the particles better, leading to higher heating rates. 1 reference, 15 figures.

32623 (EPRI-CS—3182-Vol.1, pp 5.1-5.22) **Foster Wheeler's low NO/sub x/ combustion program status and developments.** Vatsky, J. (Foster Wheeler Energy Corp., Livingston, NJ). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Foster Wheeler Energy Corporation has developed, and is continuing to advance the state of the art of, internally staged low NO/sub x/ burners. These produce low emission levels without using overfire air or tertiary air ports. Currently, the standard commercial offering is the Controlled Flow/Split-flame burner which consistently achieves NO/sub x/ levels 60% below turbulent burner emissions in both retrofit and new unit operation. A fuel-staging burner concept, investigated in the mid-70's but not commercialized, is now being evaluated for its potential to enhance the NO/sub x/ performance of the commercial burner. Internally staged burners are advantageous because flame shapes are similar to those of older turbulent burners, thereby allowing high capacity low NO/sub x/ burners to be used. Field experience has now been obtained over the capacity range which has been the historical norm for pulverized coal firing: 35 to 300 million Btu/hr. 13 figures.

32624 (EPRI-CS—3182-Vol.1, pp 6.1-6.14) **Fossil steam generator NO/sub x/ control update.** Barsin, J.A. (Babcock & Wilcox Co., Barberton, OH). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Since the third NO/sub x/ Control Seminar of 1980, additional information has been gathered concerning actual NO/sub x/ emissions from fossil-fuel power plants equipped with B & W Dual Register Burners/Compartmented Windbox furnace systems. These systems use a wide range of both bituminous and subbituminous coals. The field results, from actual units firing coal and oil, have demonstrated NO/sub x/ reduction of up to 60 percent compared to units without NO/sub x/ control. B & W's future low-NO/sub x/ R & D direction is summarized as well as the laboratory work done on the High Nitrogen Liquid Fuel burner (HNLF). Also, the most recent laboratory-facility additions (a new 5 x 10^6 Btu/hr furnace, atomization facility and laboratory ashing furnace) are described. These additions will permit more extensive small-scale work. Retrofit concepts for the pre-NSPS coal-fired units, both cyclone and pulverized coal, are presented. Furthermore, a summary is given of B & W's future low-NO/sub x/ R & D direction for meeting the increasingly restrictive NO/sub x/-emission levels. 5 references, 9 figures.

32625 (EPRI-CS—3182-Vol.1, pp 7.1-7.9) **Status of tangential firing low NO/sub x/ technology.** McCartney, M.S.; Collette, R.J. (Combustion Engineering, Inc., Windsor, CT). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Since 1971, the firing systems that C-E has used to meet NSPS have remained unchanged. Although overfire air (OFA) has been supplied on all C-E units since 1971, it is needed, in most cases, to meet only the 1979 NSPS. Thus, units designed today to meet the current standards have the benefit of eight years of operating experience. To maintain an orderly transition in fuel firing system design, C-E has two major, parallel programs to meet lower NO/sub x/ levels on both new and existing boilers in the 1980's. The first program, which is being developed with the EPA, is the Low NO/sub x/ Concentric Firing System (LNCFS). The second is the PM burner developed by Mitsubishi Heavy Industries (MHI) and licensed by C-E for application in the US and Canada. 6 references, 7 figures.

32626 (EPRI-CS—3182-Vol.1, pp 10.1-10.37) **NO/sub x/ emissions control with the distributed mixing burner. Part I. Field evaluation on an industrial size boiler.** Folsom, B.; Abele, A.; Reese, J.; Vatsky, J. (Energy and Environmental Research Corp., Irvine, CA; Foster Wheeler Corp., Livingston, NJ). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

The distributed mixing burner (DMB) is a low NO/sub x/ pulverized coal burner for wall-fired applications. It consists of a circular burner with outboard air ports. Low NO/sub x/ emissions are achieved by injecting a portion of the combustion air through the ports so that the circular burner operates under reducing conditions. An overall oxidizing environment is maintained in the furnace to minimize slagging and corrosion. Field operation of the DMB is being evaluated on a 98 Kg/hr (215,000 lb/hr) four-burner industrial-size boiler. This part presents the results of baseline field tests with the original equipment burners and research furnace tests of a prototype DMB. Field tests of the DMB are in progress. Field operating industrial and utility furnaces have a wide range of thermal environments and utilize burners with a wide range of heat release capacities. Both of these factors can affect burner performance and in particular NO/sub x/ emissions. This part discusses tests of several DMBs in three research furnaces. The tests covered a wide range of burner scales and thermal environments. Implications for applications to field operating equipment cre discussed. 9 references, 12 figures, 6 tables.

32627 (EPRI-CS—3182-Vol.1, pp 11.1-11.25) **Evaluation of tangential fired low NO/sub x/ burner.** Takahashi, Yasuro; Sengoku, Tadamasa; Nakashima, Fumiya; Kaneko, Shozo; Tokuda, Kimishiro. (Mitsubishi Heavy Industries, Ltd., Tokyo, Japan). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Mitsubishi Heavy Industries (MHI) was contracted by the Electric Power Research Institute (EPRI) and the Electric Power Development Corporation (EPDC) to evaluate and to confirm the advanced low-NOx burner technology to minimize NOx emissions from tangential fired pulverized coal boilers in United States. The advanced low-NOx burner technology used, named low-NOx PM burner technology, has been developed by MHI in response to stringent NOx emission regulations in Japan. The four coals selected for the low-NOx PM combustion test provide a wide range in coal properties which are typical of US utility usage. The coals include: (1) low sulfur Eastern bituminous coal; (2) high sulfur Midwestern bituminous coal; (3) high nitrogen, low sulfur Western subbituminous coal; and (4) Texas lignite. From the combustion tests of the low-NOx PM burner using the 4 ton/hour (nominally 12.5 MW) pulverized coal fired test furnace with the US typical four coals, the excellent low NOx performance was proved with stable and good combustion conditions (low unburnt carbon). And, the applicability of the low-NOx PM burner for tangential-fired pulverized coal utility boilers was confirmed. 7 references, 24 figures, 4 tables.

32628 (EPRI-CS—3182-Vol.1, pp 11.26-11.43) **Feasibility study of a low-NO/sub x/ retrofittable firing system with US coals.** Kokkinos, A.; Donais, R.E.; McCartney, M.S.; McElroy, M.W. (Combustion Engineering, Inc., Windsor, CT; Electric Power Research Institute, Palo Alto, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

A feasibility study for application of the PM firing system to new and retrofit tangentially fired utility boilers has been completed. The study has shown that the PM firing system is applicable to existing and new utility boilers. The ease and costs of installation are proportional to the level of NO/sub x/ emissions guarantee required. 1 reference, 8 figures, 2 tables.

32629 (EPRI-CS—3182-Vol.1, pp 12.1-12.25) **Low-NO/sub x/ firing system for tangentially coal-fired utility boilers: preliminary testing.** Kokkinos, A.; Lewis, R.D.; Borio, R.W.; McCartney, M.S.; Ferraro, J.M.; Keele, K.E. (Combustion Engineering, Inc., Windsor, CT; Exxon Research & Engineering Co., Florham Park, NJ; Utah Power & Light Co., Castledale, UT). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

A full scale utility demonstration of Combustion Engineering's Low-NO/sub x/ Concentric Firing System (LNCFS) is currently being conducted at Utah Power & Light's 420 MWe Hunter No. 2 boiler with EPA sponsorship. This paper represents the results of the recently completed baseline and post-modification testing. A preliminary analysis of the results has shown that NO/sub x/ emissions can be reduced from baseline emission levels of 460 to 480 ppM (corr. to 3% O_2) and 360 ppM with overfire air to levels of 240 to 260 ppM with overfire air following the LNCFS modification. Additional testing is planned to further optimize the emissions reduction capabilities of the system and to determine the long term effects of low-NO/sub x/ operation on boiler performance. 13 references, 16 figures, 2 tables.

32630 (EPRI-CS—3182-Vol.1, pp 13.1-13.13) **Economic and engineering analysis of arch-fired furnaces.** Vatsky, J.; Cichanowicz, J.E. (Foster Wheeler Energy Corporation, Livingston, NJ; Electric Power Research Inst., Palo Alto, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

The majority of arch-fired steam generators are used to fire difficult to burn fuels such as anthracite and coke. However, there are twelve units in the Wisconsin Electric Power Co. system (WEPCo) which fire bituminous coal. Since these units were all built prior to 1960 and are significantly lower in NO/sub x/ emissions than other units, the Electric Power Research Institute (EPRI) contracted with Foster Wheeler Energy Corp. (FWEC) to evaluate the emissions performance of these units, perform an engineering evaluation of the design, and prepare cost estimates for new 500 MW units designed to achieve minimum NO/sub x/. Emissions data from the WEPCo units was taken by KVB, Inc., under a separate EPRI contract. This evaluation is summarized and the NO/sub x/ predictions and cost estimates are provided. 7 figures.

32631 (EPRI-CS—3182-Vol.1, pp 18.1-18.23) **In-furnace control of NO formation in gas- and oil-fired utility boilers.** Radak, L.J.; Weir, A. Jr.; Morton, B.G.; Mansour, M.N.; Smith, L.L.; Kerho, S.E. (Southern California Edison Co., Rosemead; KVB, Inc., Irvine, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

An advanced combustion process termed In-Furnace Control of NO Formation (ICNF) has been developed and patented by the Southern California Edison Company and investigated in conjunction with KVB, Inc., to assess its effectiveness in reducing NO emission from gas- and oil-fired utility boilers. This novel combustion process provides reductions in NO emissions by controlling the combustion stoichiometry in the different regions within a boiler furnace. The ICNF process is defined by two discrete combustion stages. In the first combustion stage, either natural gas or oil is burned under fuel-rich stoichiometry in order to control both thermal and fuel NO formation. The second combustion stage employs generally natural gas in either a fuel-rich or fuel-lean stoichiometry. In most applications, the fuel supply to the second combustion stage is less than 30 percent of the total fuel supply to the boiler. By properly selecting combustion stoichiometry and fuel type, a significant reduction in NO emissions is achieved. The ICNF combustion process was demonstrated in a 45 MW and 175 MW face-fired utility boilers. In each case, the advanced combustion process provided NO emission levels below those obtained with the use of conventional combustion modification techniques. The percentage reduction in emissions achieved by the ICNF process was found to vary depending upon the boiler design and, more importantly, the NO emission characteristics of the gas and oil fired burners used in a specific boiler. 12 references, 12 figures.

32632 (EPRI-CS—3182-Vol.1, pp 25.1-25.25) **LIMB testing: the use of dry sorbents to reduce sulfur oxide emissions from pulverized-coal flames under low-NO/sub x/ conditions.** Case, P.L.; Heap, M.P.; Payne, R.; Pershing, D.W. (Energy and Environmental Research Corp., Irvine, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

The problem of limestone sorbent injection into multistaged burner (LIMB) pulverized-coal flames to reduce sulfur dioxide emissions is discussed. Also described are studies conducted at both pilot and bench scale. Pilot scale tests were conducted in two research furnaces firing at up to 20.5 MW, with a prototype distributed mixing burner. With limestone injection, sulfur dioxide captures of 3C to 40 percent were obtained for Ca/S molar ratios of 2. Test data show that burner design, coal type, and mode of sorbent injection all influence the sulfur capture process. Thermal environment in the combustion has a significant impact on sorbent utilization, depending upon the location of sorbent injection. Under conditions of low NO/sub x/ operation two modes of sulfur capture are possible: capture under fuel-rich and fuel-lean conditions. A series of bench scale studies were carried out to determine the parameters controlling capture in these two modes. Under fuel-lean conditions, the thermal history of the sorbent dictates sulfur capture. Under fuel-rich conditions, sulfur is retained in the coal in the fuel-rich region and regeneration of gaseous sulfur during second-stage burnout is possible. Rich-zone stoichiometry had an impact on sorbent utilization in the bench scale studies; utilization was low under highly staged conditions ($SR_1 < 0.7$). The effect of sorbent and fuel type was investigated. Five sorbents were used: two calcites, one marl, one dolomite, and one hydrated lime. Under all of the conditions investigated, the dolomite had the highest utilization. Three fuels were used: bituminous coal, lignite coal, and propane doped with SO_2. Fuel type has an impact on sulfur capture and was not entirely attributable to thermal effects. 9 references, 13 figures, 2 tables.

32633 **(SAND—84-8628) Simultaneous in situ measurement of the size, temperature and velocity of particles in a combustion environment.** Tichenor, D.A.; Mitchell, R.E.; Hencken, K.R.; Niksa, S. (Sandia National Labs., Livermore, CA (USA)). Jan 1984. Contract AC04-76DP00789. 42p. (CONF-840801—6). NTIS, PC A03/MF A01; GPO Dep. Order Number DE84007186.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

An in situ method for measuring simultaneously the size, temperature and velocity of pulverized fuel particles is described. Particle size is obtained by imaging a moving, incandescent particle onto a coded aperture and observing the transmitted light. A specially designed aperture yields a double-pulse signal in response to a passing particle. The ratio of the heights of the two pulses yields a measure of particle size that is independent of temperature, emissivity and refractive index. Particle temperature is obtained simultaneously by measuring the transmitted light in two wavelength bands and applying ratio (two-color) pyrometry to these signals. Velocity is measured from the same signals by transit timing. The system is operated as a single particle counter to generate the joint distribution of particle size, temperature and velocity. Since this method uses optical imaging, it is limited to applications where the particle size range of primary interest is 10 μm or larger, and the number density does not exceed $10^4/cm^3$. In addition to this constraint, the minimum particle size and temperature that can be measured is determined by shot noise in the optical detection process. The system is evaluated in a flow reactor using size-classified pulverized fuel particles. 9 references, 4 figures, 4 tables.

32634 **Coal-water slurry combustion in industrial gas turbines.** Lew, H.G.; Rieke, K.L.; Toof, E.J.L. (Westinghouse Electric, Concordville, PA). *Modern Power Systems;* **4**: No. 5, 33-39(May 1984).

A program aiming to evaluate coal-water mixture (CWM) combustion in a low emission staged rich-lean combustor for gas turbine use is being carried out by Westinghouse Electric funded by the Department of Energy's Morgantown Energy Technology Centre. The feasibility of burning CWM in this way has been demonstrated, and no operational problems have come to light. 4 references, 7 figures, 2 tables.

The National Coal Model (NCM) is designed to forecast coal production, consumption, and prices and to analyze coal-related public policy issues. It generates equilibrium solutions through a linear program formulation which balances the supply and demand for coal at minimum cost. The model has a high degree of resolution with 30 supply regions, 35 demand regions, up to 40 possible coal types and six consuming sectors. The model is capable of making both short-term and long-term annual projections under a variety of policy scenarios because it is data driven. This means that users of the model have the capability of changing such factors as region specifications, assumed inflation rates, or assumed growth rates in electricity sales though modifications in the data base; such factors are not a part of the model's structure. This built-in flexibility and high degree of resolution will allow users to address public policy issues with a great deal of precision because the model can be tailored for the analysis to be done. In addition, the model offers analysts the capability of performing the sensitivity analyses needed to gauge the uncertainty surrounding a forecast.

32637 **(EANSW-ESP—29) Coal in New South Wales.** (Energy Authority of New South Wales, Sydney (Australia)). 1982. 52p. Energy Authority of New South Wales, Sydney, Australia.

A history of the coal industry in New South Wales is given and historical data, up to the year 1980, on production, sales, feedstock and prices are presented. The data are mainly presented in tabular or graphical form.

32638 (EPRI-CS—3182-Vol.1, pp 26.1-26.25) **Economics of SCR post combustion NO/sub x/ control processes.** Damon, J.E.; Scheck, R.W.; Cichanowicz, J.E. (Stearns-Roger Engineering Corp., Denver, CO; Electric Power Research Inst., Palo Alto, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

The capital and operating costs of the Selective Catalytic NO/sub x/ Reduction (SCR) process as applied to US coal fired utility boilers have been items of considerable interest and controversy in recent years. Several studies have been issued by various entities which identify the costs of the SCR systems as they apply to US utility boilers. However, due to differences in design criteria, economic premises and scopes of supply, these studies indicate a wide range of costs. Three such studies are reviewed in order to reconcile these cost differences by establishing equivalent scopes of supply, design criteria and economic factors for each report reviewed. The operating and capital costs were then adjusted accordingly. The result is a cost comparison in which the SCR system cost differences as reported in the three studies are identified and explained. Updated capital costs and operating costs both in 1/1/83 dollars are reported in this paper. In addition other factors which could significantly increase these updated costs are reported. 3 references, 3 figures, 8 tables.

32639 **(IEA/CREAS—84/07) Organisation and structure of the Pacific steam coal trade.** Gaskin, M. (IEA Coal Research, London (UK). Economic Assessment Service). Oct 1983. 88p. (EAS-G—4). NTIS, PC $50.00.

The report examines the modern steam coal trade between the Pacific Rim countries; it focuses on institutional structure, the organization and commercial practices of the trade - including contract arrangements - and the functioning of the regional market. Questions of risk and risk handling are discussed, also the nature and degree of competition, including the significance of bilateralism, the formation of price, information flows and the effects of government intervention on market operation. The report concludes with a review of problems and prospects in the Pacific trade and with recommendations for improved market function.

32640 **(NP—4770196) Peatlands as an energy source in Finland.** (Suoseura, Helsinki (Finland)). 1982. 137p. NTIS (US Sales Only), PC A07/MF A01. Order Number DE84770196.

32641 **Fair market value of federal coal.** Gulley, D.A. (Columbia Univ., New York, NY). *West Virginia Law Review;* **86**: No. 3, 741-771(Spr 1984).

The author discusses the issue of raising public revenues through the sale of leases to mine federally owned coal. Dealing as it does with the government's role as a land lord, this subject raises issues not commonly aired in public finance discussion. The article describes the current public controversy, provides a framework for understanding the value of mineral estates, and discusses the recent history of federal policy. He concludes that the term "fair market value" obscures the fact that the price of energy reserves is at issue. When the government sets a price for its coal reserves, it sets in motion a chain of reactions that help shape the extent to which the public resource is used. 77 references, 3 figures.

(Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Mar 1984. 36p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751771.

Portions are illegible in microfiche products.

Within the framework of this research project a central installation for cooling underground mining areas was developed. The system is constituted by one coolant circuit (cold water) extending from the surface through the underground mine air coolers. The required pressure reduction in the coolant circuit is brought about by a Pelton turbine. The capacity gain of the turbine is led to a pressure pump linked mechanically to the former; the pump returns the heated-up coolant to the surface. It is possible to return slightly over 50% (based on efficiency) of the cycling coolant to the surface by combining turbine and pump. The advantages of this method against pressure heat exchanger systems is to be seen both in lower capital expenditure (utilization of standard items) as well as in lower energy expenditure (reuse of water from the coolant circuit).

32643 **(CONF-8403131—1) Toxicologic responses to a complex coal conversion by-product: mammalian cell mutagenicity and dermal carcinogenicity.** Cunningham, M.L.; Haugen, D.A.; Kirchner, F.R.; Reilly, C.A. Jr. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013434.

From EPA symposium on short-term genetic bioassays in the evaluation of complex environmental mixtures; Chapel Hill, NC, USA (27 Mar 1984).

Portions are illegible in microfiche products.

In the present study, we measured mutagenicity and cytotoxicity in hamster and human cells in vitro and tumorigenicity in mouse skin in vivo. The Chinese hamster ovary cell/hypoxanthine guanine phosphoribosyl transferase (CHO/HGPRT) assay has proven useful in estimating the mutagenic activity of pure compounds but has been used only to a limited extent with complex mixtures. The human teratocarcinoma cell line, designated P_3, used in these studies has recently been adapted for use in mutagenesis assays of individual compounds but has not previously been used to evaluate mutagenesis by complex mixtures. In this report, we compare the responses of the hamster and human cell lines and the

mouse skin to chemical class fractions of a complex organic by-product condensate (tar) of coal gasification. The composition of this complex tar is chemically similar to that of petroleum-derived tars and products of fossil fuel combustion. By testing basic, acidic, and neutral chemical class fractions of the complex tar, we demonstrated that the predominant genotoxic components were present in the neutral fraction as measured both in the CHO/HGPRT and dermal carcinogenicity assays. The human P_3 cells were less sensitive for mutagenesis and cytotoxicity than were the rodent cells. Furthermore, fractionation and bioassay provided evidence for interactive effects that indicate the importance of combining chemical characterization and toxicologic evaluation of complex mixtures. 25 references, 1 figure, 2 tables.

32644 **(PB—84-164367) Active man-cooling: a feasibility study. Final report.** Nicholl, A.G.McK.; Martin, R.; Graveling, R.A. (Institute of Occupational Medicine, Edinburgh (UK)). Dec 1983. 93p. (TM—83/16). NTIS, PC E06/MF E06.

There is a small but increasing number of men in the British mining industry working in thermal conditions at or above those at which some form of remedial action could be considered to be required. Various approaches have been investigated. Individual personal cooling using some form of cooled garment has been employed successfully in a number of industries but has not been investigated for general mining work in climatic conditions appropriate to the moderately hot, humid conditions typical of British mining. Of the other personal cooling systems which have been employed, externally connected water-cooled garments appear to offer the best potential. In order to extend the options available to the industry in combatting the effects of hot working conditions on the workforce, the present project was therefore established to examine the feasibility of using such an approach in mining conditions.

32645 **(PB—84-172303) Performance criteria guideline for three explosion protection methods of electrical equipment rated up to 15,000 volts AC. Open file report 15 Aug 81-1 Dec 82.** Linley, L.J.; Luper, A.B. (National Aeronautics and Space Administration, Las Cruces, NM (USA). White Sands Test Facility). Dec 1982. 64p. NTIS, PC A04/MF A01.

The Bureau of Mines, U.S. Department of the Interior, is reviewing explosion protection methods for use in gassy coal mines. This performance criteria guideline is an evaluation of three explosion protection methods of machines electrically powered with voltages up to 15,000 volts ac. A sufficient amount of basic research has been accomplished to verify that the explosion-proof and pressurized enclosure methods can provide adequate explosion protection with the present state of the art up to 15,000 volts ac. The routine application of the potted enclosure as a stand-alone protection method requires further investigation or development in order to clarify performance criteria and verification-certification requirements. An extensive literature search, a series of high-voltage tests, and a design evaluation of the three explosion protection methods performed at the White Sands Test Facility indicate that the explosion-proof, pressurized, and potted enclosures can all be used to enclose up to 15,000 volts ac, if the performance criteria and verification-certification requirements recommended in this guideline are implemented.

32646 **(PB—84-182765) Methodology development for mine life safety system evaluation. Open file report 1 Jan 80-28 Feb 82.** Nutter, R.S.; Smith, N.S.; Voltz, W.R.; Klinkhachorn, P.; Tuthill, D.F. (West Virginia Univ., Morgantown (USA). Dept. of Electrical Engineering). 6 Jun 1982. 429p. NTIS, PC A19/MF A01.

A methodology was developed for qualitative safety hazard evaluation and quantitative reliability analysis of mine monitoring and control systems. Detailed application of these techniques were made to two commercial monitor-control systems and to a microprocessor-based system. A controlled environmental test was conducted on a set of one of the commercial system's outstations. A software reliability evaluation methodology was also developed and applied.

0170 Legislation And Regulations

32647 **Energy independence through increased utilization of American coal: goal of the 98th Congress.** McClure, J.A. (United States Senate, Washington, DC). *West Virginia Law Review;* **86**: No. 3, 687-703(Spr 1984).

The 98th Congress has considered a number of coal-related bills in an effort to improve the nation's chances of achieving energy independence. Some of the requests for legislation were contradictory, calling for both more and less regulation and more and less competition. An overview of coal-related legislation covers leasing, transportation, research and development, taxes, the environment, exports, and synfuels. Congress must resolve issues in each of these areas if the domestic and international use of coal is to expand. 93 references.

32648 **Federal coal-leasing policy; and the Bisti Badlands Wilderness proposal. Oversight hearings before the Subcommittee on Mining, Forest Management, and Bonneville Power Administration and the Subcommittee on Public Lands and National Parks, House of Representatives, Ninety-Eighth Congress, First Session.** Washington, DC; Government Printing Office (1984). 891p.

Hearings held in Santa Fe, New Mexico and Washington, DC brought testimony from public officals, representatives of mining industries, environmentalists, Indians, and interested citizens and organizations on a proposal to lease public lands in the San Juan Basin for coal mining and a bill (H.R. 1575) designating the Bisti Badlands Wilderness. At issue was the Department of Interior's (DOI's) plan, already in evidence in the Powder River sale, to change the procedure for coal leasing to make these lands more readily available to private industry. Despite New Mexico's economic problems, state officials and concerned citizens generally opposed the type of resource management offered by DOI. There was preference for a slower, phased approach to leasing while transportation, environmental, and other problems are resolved. Additional statements and communications follow the testimony of over 100 witnesses.

Portions are illegible in microfiche products.

Methods for lithological processing of seismic data have been developed, which make applicable the methods of Real-Amplitude-Processing also for land-data. For high data quality the correction methods allow a reliable compensation of the coupling effects. The programs have been integrated in an existing processing system. Data of different methods and different regions of seismic measurements have been processed.

Results of a comprehensive research effort to identify, investigate and quantify factors which influence CO_2 flood performance are presented. Results of static equilibrium phase behavior experiments for mixtures of CO_2 with Wasson crude and Wasson oil containing varying amounts of solution gas are reported for three temperatures, 90, 105 and 120°F. Analysis of the resulting phase diagrams suggests a simple correlation for minimum miscibility pressure (MMP) based on the vapor pressure of CO_2, extrapolated if necessary for temperatures above the critical temperature of CO_2. Results of phase behavior experiments with the same oil and CO_2 contaminated with nitrogen are also reported, and a simple procedure for estimating the effects of changes in system temperature or contamination of the CO_2 on MMP is offered. Results of detailed measurements of phase compositions in CO_2-hydrocarbon systems are presented. The theory of the effect of CO_2-crude oil phase behavior on displacements in an ideal porous medium is tested by predicting the performance of slim tube displacements from independently measured phase behavior and fluid property data obtained with the continuous multiple contact experiment. The quantitative agreement between prediction and experiment is good enough to suggest that the essentials of CO_2-crude oil phase behavior can be modeled with a small number of pseudo-components. Modifications to the simulator to model effects of dendritic and trapped saturations are described. Calculated composition paths for both secondary and tertiary displacements indicate that microscopic limitations to mixing, due to heterogeneity of the rock or to the presence of water, adversely affect local displacement efficiency. 126 references, 170 figures, 28 tables.

32651 **(DOE/BETC—83/4) Contracts for field projects and supporting research on enhanced oil recovery and improved drilling technology. Progress review No. 36 for quarter ending September 30, 1983.** Linville, B. (ed.). (National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA)). Mar 1984. 72p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84012024.

Progress reports for the quarter ending September 30, 1983, are presented for field projects and supported research for the following: chemical flooding; carbon dioxide injection; thermal/heavy oil; resource assessment technology; extraction technology; environmental and safety; microbial enhanced oil recovery; oil recovery by gravity mining; improved drilling technology; and general supporting research.

32652 **(DOE/ET/12084—T2) Carbon dioxide for the recovery of (residual) crude oil. Final report.** Doscher, T.M.; El Arabi, M.; Gharib, S.; Oyekan, R. (University of Southern California, Los Angeles (USA). Dept. of Petroleum Engineering). Mar 1983. Contract AT03-76ET12084. 38p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013450.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The original plan of the work was altered with the agreement of the various contract officers from that of emphasis on the use of additives in improving the efficiency of carbon dioxide to a plan for developing a thorough understanding of the mechanism and basic efficiency of carbon dioxide as a recovery agent for residual crude oil. As this program proceeded, the results obtained from the physical model studies were not those anticipated from prior theoretical studies and laboratory experiments which had not been physically scaled. This required that the work be continued to no more than define and establish as unequivocally as possible the actual mechanism by which carbon dioxide might recover some of the reputed hundreds of billions barrels of residual oil in reservoirs in the United States. Only in this way could a proper evaluation of the potential of the process be defined and hopefully, subsequently, improved. The work has now been completed and leads to the conclusion that the recovery of residual oil by carbon dioxide depends on solution of the carbon dioxide in the oil and the displacement of the resulting solution by the continuing gas drive, or, alternately, a substitute water drive. The efficiency of the process will depend on the diffusion of carbon dioxide into the residual oil prior to the breakthrough of the latter and the residual oil phase saturation to the concurrent gas drive. 17 references, 16 figures.

32653 **(FRNC-TH—1461) About unilateral problems degenerated from the theory of two-phase flow in porous medium. Application to G. Chavent's modelling of techniques of secondary exploitation of petroleum deposits.** Gagneux, G. (Besancon Univ., 25 (France)). Apr 1982. 150p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84751740.

Portions are illegible in microfiche products.

This work proposes a theoretical study of two-phase flow in porous medium. The theory is more particularly explained in the case of forced displacments, in a porous medium, of a fluid by another, non-miscible, incompressible, and it can be applied in the case of enhanced recovery by water injection in petroleum deposits ("water flooding"). This modelling introduces, in the most general case, a coupled problem involving a parabolic variational inequation (or quasi-variational), doubly non-linear, degenerated, and a family of elliptic equations, the unilateral constraint coming from the fact a well effect is taken into account. The problem can be described by a group of equations and inequation; the two first parts try to show the existence of a solution of the degenerated problem. The last part leads with the general study of the oil-water unidirectional displacement; the existence of a solution is established.

32654 **(GA-A—17555) Recovery of heavy oil and tar sands using a high-temperature nuclear steam supply.** Quade, R.N.; Rao, R. (GA Technologies, Inc., San Diego, CA (USA)). Apr 1984. Contract AT03-84SF11963. 9p. (CONF-840804—25). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012571.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

In this paper, the application of the HTGR to enhanced oil recovery is explored using a typical California heavy oil field (Midway-Sunset) and a tar sands field (Maverick County, Texas) as two examples. Cost comparisons are made with available alternates, centralized coal, jumbo boilers for heavy oil, and an atmospheric fluidized bed (AFB) for tar sands. 10 references, 7 figures, 5 tables.

32655 **(IFP—31-431) Study on the available fuel during co-current in-situ combustion.** Abbas, R.M.J. (Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison). Sep 1983. 144p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84751733.

Portions are illegible in microfiche products.

The chemical reactions for the thermal recovery of heavy oils are studied. Oxidability of two crude oils is studied by effluent gas analysis: porous samples impregnated with oil are heated in an air flow. Effect of pressure on oxidation is low. For a better simulation of hydrodynamic and thermal phenomena, during the approach of the in-situ combustion front, oxidation is also studied with a previous isothermic displacement by cold water, hot water and steam in a special cell, a satisfactory evaluation of available fuel for co-current combustion is obtained but experiments are long and difficult. The effects of gas flow rate, temperature, time, oil and clay content on oxidation are determined by pyrolysis tests which are faster and more simple. A method of operation is proposed for the determination of the quantity of fuel and air necessary for a given couple oil-rock.

32656 **(NP—4750999) Petroleum and gas reservoir models, EFP 81. Technical status report 1981-05-01 to 1982-02-28.** Pejtersen, V.S.; Wuertz, J.; Bech, N.; Reffstrup, J.; Frandsen, P.E.; Winther, A. (Risoe National Lab., Roskilde (Denmark)). 1982. 174p. (In Danish). NTIS (US Sales Only), MF A01. Order Number DE84750999.

Microfiche only, copy does not permit paper copy reproduction.

Computerized simulation of petroleum-gas deposits recovery permits to achieve better recovery yield and processing efficiency. Utilization of hydrocarbons in chalk reservoirs in the Danish part of the North Sea resulted in development of many computerized models available commercially. A project of heat storage in ground water reservoirs is established in collaboration between Risoe National Laboratory and the Dept. of Energy Technology at the Technical University. Computerized models simulate fluid flow and

temperatue in porous media, 2- and 3-dimensional models for black oil are tested. Simulation of Gorm field has given useful experience.

32657 **(STF—28A83008) Effect of stimulation by surfactants on the pressure gradient around an injection well.** Hafskjold, B. (SINTEF, Trondheim (Norway)). Mar 1983. 28p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751029.

A 1-dimensional, radial reservoir flow model has been used to study the effect of stimulation by use of surfactants on the pressure drop around an injection well. The model applies to injection of seawater in the oil zone of a reservoir. The case of incompressible steady-state flow has been considered. The calculations revealed that the pressure drop around the injection well for a particular case is reduced by about 50 percent because of stimulation. The injection well in the model is stimulated by displacing the residual oil around the well into the reservoir. This is achieved by utilizing the capability of surfactants to reduce the interfacial tension between oil and water by a fact of two or four orders of magnitude. 10 drawings, 3 tables.

Diesel fuel-, gasoline-, and heating oil-range materials prepared from coal, shale, and petroleum are found to exhibit similar toxicological properties in studies to date. Benzo(a)pyrene content, the weight distribution of bioactive chemical fractions, bacterial mutagenicity, and skin tumorigenicity are found comparable for several refined products. 15 references, 3 tables.

32659 **(STF—15A82041) Studies of flames from various accidental release geometries. Flame size and radiation measurements.** Hustad,J.; Soenju,O.K. (SINTEF, Trondheim (Norway)). Jun 1983. 71p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751024.

Measurements of flame geometry, thermal radiation flux, flame temperature, total heat transfer rate to bodies submerged in the flame, lift-off heights and blow-out limits are made on large turbulent diffusions flames up to flame heights of 8 m and heat releases of 7.5 MW. Various fuel release nozzle geometries have been used. In particular, circular tubes and rectangular channels with aspect ratios up to 8000 have been tested. Vertical propane and methane flames as well as horizontal propane flames have been investigated. Approximate correlations and scaling laws have been established for flame height and flame diameter as function of the Froude Number. Further, approximate correlations for radiation flux distributions and flame lift-off heights have been obtained. 28 drawings, 17 tables.

32661 **(DOE/FE—0039) Naval Petroleum and Oil Shale Reserves. Annual report of operations, fiscal year 1983.** (USDOE Assistant Secretary for Fossil Energy, Washington, DC. Office of Naval Petroleum and Oil Shale Reserves). 1983. 27p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013544.

Naval Petroleum Reserve No. 1 (NPR-1) in California and Naval Petroleum Reserve No. 3 (NPR-3) in Wyoming continued to be operated at their maximum efficient rates of production during FY 1983. The Government-owned portion of Naval Petroleum Reserve No. 2 in California continued to be leased to private operators as it has been for over 50 years, with the Government receiving a royalty share of production from the leases. All of the Government's share of crude oil produced at the Petroleum Reserves during FY 1983 was sold to the Department of Defense, while natural gas and natural gas liquids were sold competitively on the open market. FY 1983 revenues from the three Naval Petroleum Reserves totaled over $1.5 billion in general receipts and Windfall Profit Taxes. Program expenditures totaled approximately $220 million. The drilling of new wells continued to be an important factor in maintaining the production of NPR-1 and NPR-3 at maximum efficient rates, and it is expected that the primary drilling phase will be concluded in FY 1984. None of the three Naval Oil Shale Reserves has been developed on a commercial scale, and activities concerning these Reserves now focus on identifying potential problems that might restrict development should economic or strategic conditions make it desirable to tap these oil shale resources. Overall, the Naval Petroleum and Oil Shale Reserves program continues to benefit from excellent management, and effective and economic field operations.

32662 **(PB—84-174036) Assessment of the energy balances and economic consequences of the reduction and elimination of lead in gasoline.** (Concawe, The Hague (Netherlands)). 1983. 45p. (CONCAWE—11/83R). NTIS, PC E04/MF E01.

This report gives details of a study carried out at the request of the EEC Working Group: Evolution of Regulations - Global Approach (ERGA). The study assesses the impact of reducing or eliminating lead in gasoline and considers the ultimate situation, ten to fifteen years after the introduction of unleaded gasoline, when only unleaded gasolines are being manufactured. Computer models of refineries incorporating the latest refining technology are used to predict the optimum octane number for unleaded gasoline which will minimize total energy consumption. The report explores the variation of this optimum as the parameters of the base case are varied. The report also comments on the accompanying changes in gasoline composition and the way this will influence automotive exhaust emissions. (Copyright (c) CONCAWE Den Haag December 1983.)

32663 **Strategic stockpile acquisitions and the current world oil market.** Curlee, T.R. (Oak Ridge National Lab., TN). *Energy Policy;* **12**: No. 2, 216-219(Jun 1984).

Recent legislation requires that the US government increase the Strategic Petroleum Reserve at a rate of 300,000 bbl/day; however, under certain circumstances that rate can be lowered to 220,000 bbl/day. It is speculated that the Administration will opt for the lower rate because of recent trends in the world oil market and in the US economy. This communication argues, however, that a rapid stockpile acquisition rate of at least 300,000 bbl/day is called for. While recent trends in the world oil market change the nature of the vulnerability problem, these trends do not necessarily imply that the long-run oil vulnerability problem is less severe. Further, given that there is a need for larger strategic stocks in the long run, the present depressed market conditions suggest that stocks should be accumulated at a rapid rate while these conditions continue. 10 references.

32664 (EPRI-CS—3182-Vol.1, pp 31.1-31.26) **Thermal DeNO/sub x/ demonstration project.** Dziegiel, H.T.; Aure, T.B.; Anderson, D.W. (Los Angeles Dept. of Water and Power, CA). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

To gather information for pending regulatory proceedings, the Los Angeles Department of Water and Power undertook in 1978 a demonstration of Exxon Research and Engineering Company's patented Thermal DeNO/sub x/ process. In this process, ammonia is injected into the boiler flue gas where the gas temperature is between 1600° F and 2200° F. The ammonia reacts with the NO/sub x/ to form nitrogen and water. A full-scale Thermal DeNO/sub x/ System was installed on Haynes Generating Station, Unit 4, which is a 235 MWe oil- and gas-fired unit in May 1982. The Thermal DeNO/sub x/ System uses a piping grid located in the flue gas stream just downstream of the secondary superheater to inject a mixture of ammonia vapor/compressed air. The grid is subdivided into six zones with independent ammonia injection controls for each zone. A one-year test program on both fuel oil and gas is planned. Initial testing at full load on fuel oil has shown NO/sub x/ reductions between 40 and 50 percent with ammonia breakthrough less than 65 ppM. 3 references, 14 figures, 3 tables.

32665 **(PB—84-168293) OHMSETT (Oil and Hazardous Materials Simulated Environmental Test Tank) test series 77: Global Oil Recovery Skimmer, Veegarm Skimming Arm, Kebab 600, Wylie Skimmer and the Skim-Pak Cluster. Final report Jan 80-Jun 81.** Borst, M. (Mason and Hanger-Silas Mason Co., Inc., Leonardo, NJ (USA)). Mar 1984. 102p. NTIS, PC A06/MF A01.

This report covers the performance testing of five oil spill recovery devices at the Oil and Hazardous Materials Simulated Environmental Test Tank in Leonardo, New Jersey. The GOR Skimmer was tow tested in harbor chops, regular waves, and calm water at tow speeds through 2 knots to determine the effectiveness of modifications made to the device since it was last tested. The performance was consistently lower after the modifications in all conditions. The Hydrovac Veegarm was the most exhaustively tested skimmer in this program.

32666 **(STF—15A83030) Equipment for incinerating oily mass. PFO-project No. 2302.** Aasen, D. (SINTEF, Trondheim (Norway)). May 1983. 52p. (In Norwegian). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751026.

Portions are illegible in microfiche products.

Oily mass collected from shores during oil spill removal is considered dry burnt in a suitable incinerator. The market was searched in order to find a commercial type of oven suited for modifying into a mobile incinerator for oil pollution control. The search was negative as to commercial types of ovens. However, a smaller test burner of the rotary kiln type,Was found in a Norwegian firm. The kiln was later tryed out on oily mass and a specific solution with combined incineration of mud and mass has been planned for and recommended to the employer. The incinerator will have a capacity of 200 l oily mud or mass per hour. The rotary kiln principle is recommended and tested in similar Canadian projects. Experiences from them are a substantial basis for our recommandations. 15 drawings, 19 photos, 6 tables.

32667 **(FRNC-TH—1327) Experimental and theoretical study of a two-phase flow in vertical and near-horizontal pipes. Application to petroleum engineering.** Genin, R. (Paris-6 Univ., 75 (France)). Dec 1980. 139p. (In French). NTIS (US Sales Only), PC A06. Order Number DE84750798.

Paper copy only, copy does not permit microfiche production.

Very few deposits deliver only oil or natural gas. In the majority of production wells, the two phases are simultaneously blown off, and often water complicates the problem for the flow becomes a three-phase flow. In most cases, the two phases (gas and liquid) are delivered in the same pipe to the terminal. The study presented in this report concerns the pipeline between the FRIGG deposit situated in the North Sea, and, the North-East coast of Scotland. The first part of the paper gives a description of the line and sets the main problems. An experimental study and a theoretical analysis in the upright part of the line are presented in the second part. The experimental study leads to study an annular flow in all the parts of the line. The mean thickness of the liquid film being small, laws having a good physical behaviour when the liquid presence factor tends to zero are formulated; it's an asymptotic two-phase flow model. Some comparisons with other experimental results in steady-state conditions, and with other calculation models are presented and discussed. A fifth part deals briefly with unsteady-state two-phase flow. In conclusion, the configuration of the flow is known, for the tested flow rates in the vertical and near-horizontal parts of the line. The transition to the flow with droplets is well specified for high flow rates. The asymptotic model gives good results for the liquid fraction volume and the pressure drops in the case of FRIGG; its extension to the case of CONOCO allows to think of hopeful possibilities of extrapolation. The linear filling pattern gives a convenient mean for transient flow estimates; the case of the MARLIN line shows it can be applied to other flow patterns with some chances to get favourable results.

Abstract in French.

The thermal stabilities of five aviation turbine fuels were examined employing the Jet Fuel Thermal Oxidation Tester (JFTOT) and an optical absorbance method based on the Phillips 5 ml bomb

test. No correlation was observed between the ranking of the fuels by the two methods.

32671 **(BMFT-FB-T—83-321) Analysis of heaviest crude oils and hydropyrolysis products.** Shalhoub A.; Neumann, H.J. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Dec 1983. 52p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751286.

Portions are illegible in microfiche products.

The project has three objectives: 1. Development of an analysis method for heaviest crude oils and hydropyrolysis products, 2. Characterization of heaviest crude oils from tar sands, 3. Investigation of hydropyrolysis products. We have developed an analysis method, and we have analysed several samples. The results show the differences between crude oils and distillation residues on the one hand and heaviest oils on the other, and they give an explanation for the unexpected poor results of the hydropyrolysis of the heaviest crude oils: The heaviest oils have high contents of asphaltenes up to 20%, but low contents of petroleum resins. The ratio asphaltenes : resins is high, between 5 and 10. The asphaltenes and the resins have high medium relative particle masses, the asphaltenes > 10.000, the resins up to 2.000. The acid number of the resins is higher than these of the asphaltenes, the basic number is lower. The petroleum resins are free from heavy metals. The maltenes have high contact of hetero compounds up to 25%. In the distillation we have an enrichment of the distillation redisue in asphaltenes and a decrease in petroleum resins.

32672 **(IFP—31-115) Solubility of hydrocarbons in the compressed natural gas. Application to petroleum migration in sedimentary basins.** Nogaret, E. Portions are illegible in microfiche products.

Study of migration in gaseous phase is this thesis object. Principal characteristics of petroleum and natural gas origin and migration are recalled in the first chapter; the high-pressure device, used to study the behaviour of mixtures oil-gas under pression of 1-100 MPa and temperature of 20-150°C, is described in the second chapter. Results of gaseous phase composition experiments in the case of light oil and natural gas or methane mixtures are presented. These equilibriums modeling has been based on some simple thermodymanic laws and on experimental results. In a third chapter, the model presented describes, with a reasonable precision, the composition of phases together with heavy hydrocarbon fluid mixtures. In the fourth chapter, gas-condensate pool characteristics are recalled, where petroleum is dissolved in gas; then the thermodynamic model has allowed to evaluate oil-gas mixture behaviour in source-rocks and in reservoirs, in the case of a "theoretical" sedimentary basin. Regions where petroleum migration in gaseous phase is possible can then be located. In the last chapter, Mahakam delta basin is studied. This basin and the petroleum fields are briefly described; behaviour of oil-gas mixture in the source-rocks, together with the composition of the oil having possibly migrated in gaseous phase, are, there also, tentatively evaluated. These theoretical results will be compared to many observations made on those fields.

32673 **(NTNF/B—1840.08733) Fractional distillation of North Sea oil. Final report for NTNF-KS.** Glasoe, Oe.; Steinert, O. (SINTEF, Trondheim (Norway)). Mar 1981. 31p. (In Norwegian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751023.

This work contains experimental investigations of physical data of crude oil samples from five different North Sea reservoirs. Average boiling point, relative specific weight and the corresponding molecular weight is determined as well as the composition of hydrocarbons in each fraction by chromatographic analysis. Equation systems are developed with the experimental data as base and values for average boiling point, relative specific weight, molecular weight and the characterization factor for each fraction are calculated. These values are evaluated with the aim of generally characterizing North Sea oil. 12 drawings, 24 tables.

32674 **(ORNL/TM—9196) Chemical characterization and toxicologic evaluation of airborne mixtures. Chemical and physical characterization of diesel fuel smoke.** Jenkins, R.A.; Holmberg, R.W.; Wike, J.S.; Moneyhun, J.H.; Brazell, R.S. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 72p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013112.

Diesel fuel No. 2 (DF2) used in the vehicle engine exhaust smoke system (VEESS) has been chemically and physically characterized. A battery of fractionation procedures was used, including elemental analysis, inductively coupled plasma, uv/visible and infrared spectrometry, high performance liquid chromatography (HPLC), gas chromatography and GC/MS. The best overall characterization was provided, by HPLC, which yielded four major fractions (saturated hydrocarbons, 70 percent; substituted benzenes, 16 percent 2-ring aromatics, 12 percent; and 3-ring aromatics, 2 percent) and one minor fraction (polar aromatics, 0.2 percent). These fractions were further analyzed by GC/MS. No single component accounted for more than about one percent of the DF2. The major effect of aerosolization of the DF2, in a generator designed to simulate the military deployment of VEESS smoke, was partitioning of constituents between the vapor and the liquid particulate phase on the basis of their relative volatility. No significant levels of constituents not found in the unaerosolized DF2 were observed in the liquid phase of the smoke generated from it.

The Western Gas Sands Subprogram (WGSS) is a multidisciplinary research effort within the US Department of Energy program on Unconventional Gas Recovery. The subprogram, managed by DOE's Morgantown Energy Technology Center, is directed towards the development of tight (very low permeability) lenticular gas sands in the western United States. The purpose of the subprogram is to demonstrate the feasibility of economically producing natural gas from low-permeability reservoirs. The subprogram has two broad goals: (1) to reduce the uncertainty of the reservoir production potential and (2) to improve the extraction technology. With input from the gas industry, universities, and geologic and engineering consulting firms, the WGSS was broadened to include more fundamental research and development. Consequently, for the last five years it has focused on improving diagnostic instrumentation, geophysical and engineering interpretation, and stimulation techniques. Integrated geologic studies of the three priority basins containing tight sands and selected by DOE as research targets have also been pursued as part of this new effort. To date, the following tentative conclusions have evolved: Permeability of the tight gas sands can be as much as three to four orders of magnitude lower than conventional gas deposits. Nineteen western geologic basins and trends containing significant amounts of tight gas have been identified. Gas resources in the priority geologic basins are Piceance Basin, 49 tcf., Uinta Basin, 20 tcf., and Greater Green River Basin, 136 tcf. The presence of natural micro-fractures within the production zone of a reservoir and the effective propped length of hydraulically-induced fractures are the critical parameters for successful development of tight sand resources. 8 figures.

32676 (UCRL—53535) Mechanical properties of multiwell MWX-1 sandstone and siltstone at high pressures. Lin, W. (Lawrence Livermore National Lab., CA (USA)). Apr 1984. Contract W-7405-ENG-48. 24p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013333.

Portions are illegible in microfiche products.

Mechanical properties of siltstone and sandstone samples from two depths in Multiwell N# 1 (MWX-1) in Colorado are reported. The overburden pressure was estimated at 49 MPa for the siltstone cores from 1994-m depth and 59 MPa for the sandstone cores from 2405-m depth, respectively. The measured properties include tensile strength, peak and residual compressive strength, stress-strain relations under triaxial compression to 100 MPa confining pressure, and hydrostatic compressibility to 850 MPa confining pressure. Both rocks are virtually isotropic with respect to these properties. The siltstone is weaker than the sandstone under both tensional and compressive loadings. The sandstone is stiffer than the siltstone under triaxial cylindrical compression. However, the siltstone is stiffer than the sandstone under hydrostatic compression at pressures below 50 MPa. Above 50 MPa the sandstone becomes stiffer than the siltstone. 8 references, 10 figures, 4 tables.

The Multi-Well Experiment, sponsored by the Department of Energy, has two overall objectives: (1) characterize low-permeability lenticular gas sands and (2) develop and evaluate technology for the production of natural gas from them. The third well of the experiment was drilled between June and August 1983 at a site in the Rulison Field, seven miles southwest of Rifle, Colorado. This report represents the as-built data and results from that well. 11 figures, 11 tables.

32678 (DOE/EIA—0130(84/04)) Natural gas monthly, April 1984. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Jun 1984. 146p. NTIS, PC A07/MF A01; 1 - GPO; GPO Dep. Order Number DE84013536.

Portions are illegible in microfiche products.

Dry gas production during April 1984 was estimated at 1428 billion cubic feet (Bcf), 13.7% above April 1983 dry gas production. Consumption of natural gas during April 1984 was an estimated 1415 Bcf, 2.1% above the April 1983 level. Compared to the previous March, residential consumption in March 1984 was up 16.4%, commercial consumption was up 13.5%, industrial consumption was up 25.4%, and electric utility consumption was down 1.0%. The volume of working gas in underground storage reservoirs at the end of April 1984 was 21.9% below the April 30, 1983 level. The average wellhead price of natural gas in February 1984 was $2.63 per thousand cubic feet (Mcf). In February 1983, the average was $2.64 per Mcf. In April 1984, the average residential price of natural gas was $5.98 per Mcf. The comparable price in April 1983 was $6.04 per Mcf. The average wellhead price for natural gas purchases projected for May 1984 by selected interstate pipeline companies was $2.72 per Mcf.

32679 (DOE/EIA—0489) Competition and other current issues in the natural gas market. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). Jun 1984. 115p. NTIS, PC A06/MF A01; 1 - GPO; GPO Dep. Order Number DE84013669.

32680 (SAND—84-1086C) Application of a new multiple fracturing technique to enhance gas production in Devonian shale. Cuderman, J.F. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 6p. (CONF-830903—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013213.

From IEEE international conference on computer-aided design; Santa Clara, CA, USA (12 Sep 1983).

A new multiple fracturing technology has been applied in stimulating a Devonian shale gas well. In this new technique, propellants are used to obtain controlled pressurization of the wellbore to produce multiple fractures. The pressurization is controlled by suitable choice of propellants having different burn rates. The pressure risetime is the most important parameter governing fracture behavior. Methods are presented for specifying both the risetime and propellants to achieve it for Devonian shales. The Devonian shale stimulation was conducted in a 1040 m deep well in Meigs Co., Ohio. The experimental installation and hardware used are described together with results which include an increase in production from 190 m^3/day to 623 m^3/day. 7 references, 5 figures, 1 table.

0310 Legislation And Regulation

32681 (DOE/PE—0054-Exec.Summ.) First report required by Section 123 of the Natural Gas Policy Act of 1978. Executive summary. (USDOE Assistant Secretary for Policy, Safety and Environment, Washington, DC). Jul 1984. 7p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013785.

Section 123 of the Natural Gas Policy Act of 1978 (NGPA) requires the Department of Energy to submit two reports on the natural gas market to the President and Congress. This is the first report. This report examines the current conditions in the natural gas market and analyzes the future effects of three alternative natural gas policies in terms of prices, supply, demand, competitive conditions, market forces, and market equilibrium. The report concludes that gas prices will not rise significantly or fly up after January 1, 1985, when partial decontrol becomes effective under the NGPA. The report also concludes that current federal regulations have inhibited the gas market from responding efficiently to changing market conditions and that the entire Nation would benefit from comprehensive deregulation legislation in the following ways: (1) economic benefits of $33.6 billion to $48.7 billion as a result of greater efficiency, higher domestic gas production, and lower payments for gas and oil imports; (2) recovery of an additional 27 trillion to 48 trillion cubic feet of domestic low-cost, old gas supplies that would not be produced under the NGPA; (3) lower consumer prices for natural gas - $0.56 per thousand cubic feet lower in 1985 than under the NGPA, and $0.27 to $0.45 per thousand cubic feet lower from 1986 to 1995 than under the NGPA; (4) higher levels of both domestic gas consumption and domestic gas production than under the NGPA; and (5) greater flexibility in the gas market to

adjust to changing circumstances, thereby preventing the recurrence of shortages and surpluses.

32683 (PB—84-159912) Venting requirements for high efficiency gas-fired heating equipment. Final report. DeWerth, D.W.; Connelly, S.M. (American Gas Association Labs., Cleveland, OH). Sep 1983. 179p. NTIS, PC A09/MF A01.

A vent simulation model was developed to calculate the capacity of vent connectors used with high efficiency (condensing) gas appliances. 45 vent capacity tables are presented for vent diameter from 1.5 to 12 inches, vent temperatures of 100 and 200F, appliance inputs from 10,000 to 10,000,000 Btu/hr, vertical heights of 0-100 ft. and horizontal distances of 0-100 ft. These tables can be used by manufacturers to design vent systems for high efficiency appliance designs and by codes and standards authorities to check installations. The tables show vent system pressures required for proper venting and whether condensation will occur within a specific vent system. The report also presents venting guidelines for materials of construction, condensate handling, insulation, and system consideration for use when venting high efficiency appliances.

32684 (PB—84-177708) Refinery heater fiber burner demonstration program. Final report Oct 81-Dec 83. Schreiber, R.J.; Gotterba, J.A.; Kesselring, J.P. (Alzeta Corp., Mountain View, CA (USA)). Dec 1983. 106p. (R—83-701-100). NTIS, PC A06/MF A01.

This report discusses feasibility of using the Pyrocore burner, manufactured by Alzeta Corporation, in gas-fired refinery heaters. This low-NOx, radiant burner can address the needs of those oil refineries that wish to enhance the emissions and thermal performance of their heaters and furnaces.

32685 (DOE/LC/10350—1616) Formation, deposition, and drainage of mist in porous media with application to oil shale retorting. Goren, S.L. (California Univ., Berkeley (USA). Dept. of Chemical Engineering). Jun 1984. Contract AS20-80LC10350. 201p. NTIS, PC A10/MF A01; 1; GPO Dep. Order Number DE84009254.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The research is aimed at developing the technological base for understanding and ultimately modeling the physical processes which control droplet size and droplet deposition within oil shale retorts. Two types of experiments were performed for this study: (1) size distributions of oil mists formed by condensation of oil vapor in an inert carrier gas were measured for a wide range of cooling rates and vapor concentrations thought to be typical of retorting conditions. Most experiments were conducted using a steady state tubular condenser which simulates a typical channel through a packed bed. Some unsteady-state experiments were conducted using an initially cold bed of shale rock and following the size distribution of the mist with time as the thermal front propagated through the bed; (2) capture efficiencies of oil mists in packed beds were measured for a wide range of droplet sizes, and gas velocities thought to be typical of retorting conditions. Both clean beds and beds with simulated liquid loading were used. 50 figures.

32686 (SAND—83-2603) Oil yield losses in non-uniform in situ oil shale retorts. Tyner, C.E. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1984. Contract AC04-76DP00789. 23p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013483.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Oil yield losses within an in situ oil shale retort can be categorized as either sweep inefficiencies or local yield losses. It is well established that rubble bed non-uniformities can contribute directly to sweep inefficiencies. However, the high local yield losses observed in recent field tests have suggested that these nonuniformities may also decrease local oil yield through increased oil coking, cracking, and combustion. To distinguish oil yield loss mechanisms caused by non-uniform permeability distributions from those caused by other factors (particle size, grade, or operating conditions), a series of pilot retorting experiments was conducted with permeability contrast as the only experimental variable. In these experiments we observed, as a function of increasing permeability contrast, increasing delays in heating (and thus retorting) within the less-permeable zones. This resulted directly in increased oil combustion and cracking losses (11 to 23% versus 5% for a uniform base condition) due to increased overlap of retorting and combustion fronts. We also observed under these conditions corresponding decreases in thermal efficiency and char utilization. Finally, two-dimensional retort modeling calculations have been completed which agree well with the experimental results and help illuminate the important mechanisms causing increased oil loss. These data, together with analyses from recent field experiments, have demonstrated conclusively that local oil yield losses (not just sweep inefficiencies) can be introduced or worsened solely by permeability contrasts. Conversely, it appears that local yield as well as sweep efficiency may be significantly improved by creating more uniform rubble beds. 18 references, 19 figures, 5 tables.

32687 Simulated in situ retorting of Michigan Antrim oil shale. Bartke, T.C.; Duvall, J.J.; Martel, R.A. *Transactions of the American Nuclear Society;* **30**: 7-8(Win 1978).

The Laramie Energy Technology Center (formerly the Laramie Energy Research Center) has been engaged in oil shale technology research for many years. As part of a continuing in situ research effort, retorting characteristics of mine-run Antrim oil shale and crushed, sieved, Antrim oil shale (-0.127 m, +0.0032 m) have been examined in the 10-ton (9,000-kg) retort (TTR) and the controlled-state retort (CSR), respectively. Antrim shale is a local name for the black Devonian-type shales that underlie much of lower Michigan in deposits that range from about 60 to 110 m thick. The organic material is held in a true shale, illite, and yields oil in the range of 3.3 x 10^{-5} to 4.2 x 10^{-5} cu m/kg. The TTR is a lined steel vessel that is 1.4/sup -m/ id x 3.7 m high. After loading the shale into the retort, combustion is initiated with a methane burner. When a combustion zone at about 800 F is established, air or a combination of air/recycle gas is passed through the retort. Retorting advance rate, heating rate, and maximum temperature depend on oxygen concentration in the input gas and on superficial gas velocity. Product oil is collected in a tank below the retort.

32688 (AD-A—138575/6) Alternate fuels combustion research. Interim report 19 May 80-20 Feb 83 on phase 2. Gratton, M.; Sampath, P. (Pratt and Whitney Canada, Mississauga, Ontario). Oct 1983. 197p. NTIS, PC A09/MF A01.

This report presents the results of the Can Combustor Test Phase (Phase II) of the Alternate Fuels Combustion Research Program. The effects of variations in fuel properties on the performance characteristics of a small can combustion system were determined. Fifteen different fuels were used, encompassing a wide range of chemical and physical properties. The tests covered current specification, broadened specification and alternate source (shale and tar sands derived) fuels. Combustor rig tests were performed to determine the effects of fuel properties on stability, low temperature light-offs, gaseous emissions, smoke emissions, metal temperatures and radiation heat loads. Attempts were also made to characterize fuel nozzle contamination and carbon formation, but these tests were somewhat inconclusive. Based on test results from can combustor tests, a test plan was formulated for testing PT6 and JT15D reverse-flow annular combustors.

0407 Health And Safety

32689 (PB—84-165794) Electrical installations in oil shale mines. Open file report 21 Sep 81-13 Aug 83. Gillenwater, B.B.; Kline, R.J.; Paas, N. (Foster-Miller, Inc., Waltham, MA (USA)). Aug 1983. 165p. NTIS, PC A08/MF A01.

This report presents recommended guidelines and regulatory changes applicable to electrical installations in underground oil shale mines. These recommendations are based on information gathered from oil shale operators, government agencies, and other knowledgeable sources familiar with existing plans for mining systems and electrical installations, and on present understanding of the problems and hazards associated with oil shale mining. Additional discussions of specific electrical problems related to oil shale mining include ground fault current levels, permissible electric wheel motors, permissible batteries and electric starting systems, intrinsically safe instrumentation, and applicability of existing test standards.

32690 (UCRL—15609) Public health risks from an oil shale industry. Perry, B.W.; Gratt, L.B. (IWG Corp., San Diego, CA (USA)). Apr 1984. Contract W-7405-ENG-48. 14p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013222.

Public health inhalation risks associated with a hypothetical one million barrels-per-day shale oil industry have been estimated for both individual carcinogens and all air pollutants as modeled by a surrogate. The populations at risk which were considered are the local oil shale region and the entire continental United States. The lifetime cancer risks from As, Cd, Cr, Ni, PAH and radiation are less than 10^{-7} occurrences per person per year. The air pollution surrogate, sulfate as a measure of all air pollution exposure, yields a result of 10^{-5} deaths per person per year with large uncertainties. Based on the sulfate surrogate model, the public mortality estimate associated with the refining of imported high sulfur oil which could be replaced by shale oil is significantly larger than the public mortality estimate associated with oil shale production. The dispersion models, health dose-response models, and key uncertainties are discussed. Public health risks associated with oil shale solid waste leachates are considered. Results of a peer review of the analysis and research needs are also presented. 53 references, 3 figures, 5 tables.

32691 (UCRL—15610) High risk groups in oil shale workforce. Gratt, L.B.; Perry, B.W.; Marine, W.M.; Savitz, D.A. (IWG Corp., San Diego, CA (USA); Colorado Univ., Denver (USA). Dept. of Preventive Medicine and Biometrics). Apr 1984. Contract W-7405-ENG-48. 13p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013225.

The workforce risks of a hypothetical one million barrels-per-day oil shale industry were estimated. The risks for the different workforce segments were compared and high risk groups were identified. Accidents and injuries were statistically described by rates for fatalities, for accidents with days lost from work, and for accidents with no days lost from work. Workforce diseases analyzed were cancers, silicosis, pneumoconiosis, chronic bronchitis, chronic airway obstruction, and high frequency hearing loss. A comparison of the workforce groups under different risk measures (occurrence, fatality, and life-loss expectancy) was performed. The miners represented the group with the largest fatality and the most serious accident rate, although the estimated rates were below the average industry-wide underground mining experience. Lung disease from inhalation exposure of about the nuisance dust threshold limit value presents a significant risk for future concerns. If future environmental dust exposure is at the 100 $\mu g/m^3$ alpha-quartz level, safety improvements in the mining sector are of prime importance to reduce the oil shale worker's life-loss expectancy. 11 references, 1 figure, 11 tables.

32692 (UCRL—15611) Risk of dust-induced lung disease in oil shale workers. Marine, W.M.; Savitz, D.A.; Gratt, L.B.; Perry, B.W. (Lawrence Livermore National Lab., CA (USA)). Apr 1984. Contract W-7405-ENG-48. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012677.

Portions are illegible in microfiche products.

Risks of non-neoplastic lung diseases for future US oil shale worker dust exposures were estimated. In the absence of an active industry, health effects rates from surrogate industries were utilized. The risk of chronic bronchitis, chronic airway obstruction, and pneumoconiosis was quantified from British coal worker data. The risk of occupational silicosis in oil shale miners was estimated using Peruvian metal mines and Vermont granite worker data. Ten percent SiO_2 composition of the dust in the respirable range from oil shale mining and crushing was used. Risk estimates were calculated at the nuisance dust threshold limit value (TLV) of 5 mg/m^3 and at the current SiO_2 TLV of 100 $\mu g/m^3$. Silicosis was the dominant pulmonary health effect, but at the 5 mg/m^3 dust level, pneumoconiosis, chronic bronchitis, and chronic airway obstruction are also important risks. Designing oil shale facilities to meet the nuisance dust TLV may not provide adequate protection to the future generations of workers involved in oil shale extraction and processing. 32 references, 1 figure, 4 tables.

32693 (GJBX—4-84) Calibration and performance of a high-resolution gamma-spectroscopy system. Dechant, G.; Donivan, S. (Bendix Field Engineering Corp., Grand Junction, CO (USA)). Jun 1984. Contract AC07-76GJ01664. 37p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84012792.

One of the primary analytical techniques for the determination of radionuclides is high-resolution gamma-ray spectroscopy. The system used by the Analytical Chemistry Laboratory of Bendix Field Engineering Corporation (Bendix) in support of the U.S. Department of Energy Grand Junction Area Office consists of four Ge(Li) detectors operated under computer control. Quantifying the nuclides of interest is accomplished by comparing the intensities of gamma-ray photopeaks in the samples with those in certified standards after correcting for self-absorption. The success of this method depends on how well the equipment can be calibrated. This document presents a general description of the calibration techniques used by Bendix for their high-resolution gamma-ray spectroscopy system. Complete descriptions of operating procedures and software documentation are contained in separate manuals. 11 references, 5 figures, 8 tables.

32694 (INFO—0066(Rev.1)) Radiation protection as part of occupational health and safety in the regulation of uranium mines in Canada. Dory, A.B. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). 9 Feb 1982. 11p. (CONF-820295—1-Rev.1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84702047.

From Saskatchewan safety council meeting; Saskatoon, Saskatchewan, Canada (9 Feb 1982).

The author establishes that radiation exposure is one of the health hazards of uranium mining and therefore has to be controlled. The jurisdictional framework for this is outlined and the role and functions of the Atomic Energy Control Board are detailed. The author then sets down seven objectives for radiation protection followed by an outline of the Canadian regulatory philosophy including an examination of two possible approaches to regulation of uranium mining and milling, and a sketch of pending new regulations. After setting down what he considers the main concerns of the AECB in mine regulation, the author details the Board's licensing process, compliance activities and relationship with workers. The conclusion includes a call for a more rational approach in considering and therefore dealing with radiation as a workplace hazard.

0504 Feed Processing

32695 (RFP-Trans—421) Microwave-heated continuous denitrification apparatus. Matsumura, Ken'ichi; Sato, Hajime. (951 3166). Apr 1984. Contract AC04-76DP03533. Translation of Japanese Kokai Patent Publication No. Sho 57-34498, 1982. 7p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013911.

A microwave-heated continuous denitrification apparatus for production of uranium oxide, plutonium oxide or a mixture of both by microwave irradiation of a solution of uranyl nitrate, plutonium nitrate or a mixture of both is claimed. It is characterized by components such as a dryer for production of dried uranyl nitrate, plutonium nitrate or a mixture of both, a belt conveyor for transporting the dried uranyl nitrate, plutonium nitrate or mixture of both, a microwave-heated oven for causing a denitrification reaction, and a scraping device for scraping the reaction product from the belt conveyor. The dryer consists of a feed-solution supply pump, a feed-solution reservoir in which the liquid is maintained at constant level with an overflow device, a drum dryer for drying the feed solution, and a scraping device for scraping the dried product.

32696 The accelerator breeder, a viable option for the production of nuclear fuels. Grand, P. (Dept. of Nuclear Energy Brookhaven Nat.'l Lab., Upton, NY 11973). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3057-3059(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

Despite the growing pains of the US Nuclear Power Industry, the dependence of the United States on nuclear energy for the production of electricity and, possibly, process heat is likely to increase dramatically over the next few decades. This paper dismisses fusion as being entirely too speculative to be practical within that time frame. Presently, between the years 2000 and 2050, fissile materials will be in short supply, whether to fuel existing inefficient LWR's or to provide initial fuel inventories for FBR's. The accelerator breeder could produce the fuel shortfall predicted to occur during the first half of the next century. The accelerator breeder offers the only practical means today of producing, or breeding, large quantities of fissile fuels from fertile materials, albeit at high cost. Studies performed over the last few years at Chalk River Laboratory and at Brookhaven National Laboratory have demonstrated that the accelerator breeder is practical, technically feasible with state-of-the-art technology, and can be made to be economically competitive with any other proposed synthetic means of fissile fuel production. This paper gives the parameters of a nearly optimized accelerator-breeder system, then discusses the developmental needs and the economics and institutional problems which this breeding concept faces.

Starting from the modelization of gaseous flow in a porous medium (flow in a capillary), we generalize the law of enrichment in an infinite cylindrical capillary, established for an isotropic linear mixture, to a multicomponent mixture. A generalization is given of the notion of separation yields and characteristic pressure classically used for separations of isotropic linear mixtures. We present formulas for diagonalizing the diffusion operator, modelization of a multistage, gaseous diffusion cascade and comparison with the experimental results of a drain cascade (N_2-SF_6-UF_6 mixture).

32698 (INIS-mf—8319) Contribution to the future prospect of uranium laser-isotope separation. Becker, F.S. (Muenchen Univ. (Germany, F.R.). Fakultaet fuer Physik). 9 Jul 1981. 145p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84780311.

The two-frequency multiphoton-dissociation of UF_6 seems promising, using a high-power laser, which is tunable in the 16 μm spectral region due to the frequency shift of the 10 μm CO_2-laser radiation, induced by the stimulated rotational Raman effect of para-hydrogen. In the present experiments the isotope selectivity of the multiphoton-dissociation process is studied in order to contribute to the solution of some questions, as for example the influence of high fluorine concentrations on the optical dissociation of UF_6. (DG).

32699 (K/OA—5672) Results from the study of UF_6 consumption on centrifuge process piping and its influence on gamma ray measurements. Close, D.A.; Cooley, J.N.; Fields, L.W.; Hughes, M.R.; Nolan, T.A.; Pratt, J.C.; Strittmatter, R.B.; Swindle, D.W. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 3 May 1984. Contract AC05-84OT21400. 10p. (CONF-840531—11). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012801.

From 6. annual symposium on safeguards and nuclear material management; Venice, Italy (14 May 1984).

A gamma ray measurement technique for confirming the absence of highly enriched uranium (HEU) in process gas of gas centrifuge enrichment plants has been developed. This measurement technique is complicated by the presence of uranium deposits on the interior walls of the process pipes. The measurement approach is described, the mechanisms for deposit are discussed, and test results for quantifying the uranium in the deposits are reported. Based on observed US plant operating conditions, the absence of HEU in the process gas can be confirmed with a 5-min gamma ray measurement.

32700 (HEDL-SA—3056-S) Testing of wet scrap recovery equipment for mixed oxide scrap reprocessing. Demiter, J.A.; Klem, M.J.; Owen, T.J. (Westinghouse Hanford Co., Richland, WA (USA)). Aug 1984. Contract AC06-76FF02170. 6p. (CONF-840802—1). NTIS, PC A02/MF A01. Order Number DE84007081.

From International topical meeting on fuel reprocessing and waste management; Jackson Hole, WY, USA (26 Aug 1984).

The Wet Scrap Recovery (WSR) program was initiated at the Hanford Engineering Development Laboratory (HEDL) by

Westinghouse Hanford Company in Richland, Washington to demonstrate fuel fabrication scrap recovery and reconversion to fuel grade oxide powder using the continuous coprecipitation-calcination (COPRECAL) conversion process. Advancements in process control equipment and instrumentation were also developed and demonstrated.

32701 **(KFK—3619) Determination of the distribution of plutonium concentration in uranium- and plutonium dioxide by X-ray analysis.** Riella, H.G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). Dec 1983. 155p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84751446.

The diffraction profile measured on a (U, Pu)O_2-preparation consists of an equipment broadening function and the physical profile whose broadening is caused by the limited size of the coherently scattering domains, the lattice distortion and the Pu concentration distribution. The determination of the line broadening influences - size of the coherently scattering domains, lattice distortion and Pu concentration distribution - calls for knowledge of the instrument broadening function. This instrument function including the parameters of the diffractometer used, such as the horizontal or vertical divergence of X-rays, the width of the emission lines, the finite slit width of the detector diaphragm etc., was determined theoretically. The separation decovolution of the equipment function from the diffraction profile obtained in the experiment was performed in the Fourier space. Starting from the domain size function and the lattice distortion function a method has been developed which allows to determine the mean domain size, the lattice expansion distribution within a domain and the distribution of plutonium concentrations.

32702 **(CEA-R—5241) Study of the chemical interactions of actinide cations in solution at macroscopic concentrations.** Maurice, C. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France)). 1983. 201p. (In French). NTIS (US Sales Only), PC A10/MF A01. Order Number DE84751570.

Portions are illegible in microfiche products.

The aim of this work was to study the interactions of pentavalent neptunium in dodecane-diluted tributyl phosphate with other metallic cations, especially uranium VI and ruthenium present in reprocessing solutions. Pentavalent neptunium on its own was shown to exist in several forms complexed by water and TBP and also to dimerise. In the complex it forms with uranium VI the interaction via the neptunyl oxygen is considerably enhanced in organic solution. Dibutyl phosphoric acid strengthens the interaction between neptunium and uranium. The Np V-ruthenium interaction reveals the existence of a new cation-cation complex; the process takes place in two successive stage and leads to the formation, reinforced and accelerated by HDBP, of a highly stable complex. These results contribute towards a better knowledge of the behaviour of neptunium in the reprocessing operation.

32703 (INIS-BR—119, pp 132) **Degradation of TBP and diluents in the extraction of actinides in the reprocessing.** Barreta, L.G.; Luz, C.T.L.; Bellido, A.V. (Instituto de Engenharia Nuclear, Rio de Janeiro (Brazil)). 1981. (In Portuguese). NTIS (US Sales Only), PC A08/MF A01. Order Number TI84780333.

In Annual Progress Report of 1981.

In Annual Progress Report of 1981.

32706 **(KFK—3439) Simulation of nuclear fuel reprocessing for safeguards.** Canty, M.J.; Dayem, H.A.; Kern, E.A.; Spannagel, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Datenverarbeitung in der Technik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Kernmaterialueberwachung). Nov 1983. 50p. (Juel—1865). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751440.

For safeguarding the chemical process area of future reprocessing plants the near-real-time material accountancy (NRTMA) method might be applied. Experimental data are not yet available for testing the capability of the NRTMA method but can be simulated using a digital computer. This report describes the mathematical modeling of the Pu-bearing components of reprocessing plants and presents first results obtained by simulation models.

32707 **(KFK—3637) Distribution of U(IV), U(VI), Pu(III) and nitric acid between 30 vol.% tributyl phosphate in dodecane and aqueous nitrate solutions.** Tachimori, S.; Nakashima, T.; Kolarik, Z.; Schuler, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Nov 1983. 23p. (PWA—68/83). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751501.

The distribution of U(IV), U(VI), Pu(III) and nitrid acid between 30 vol.% TBP in dodecane and aqueous nitrate solutions, also containing hydrazine nitrate, was studied in batch experiments. Distribution ratios of the components were measured as functions of the concentrations of nitric and of uranium(IV), uranyl, plutonium(III) and hydrazine nitrates. Major part of the data was obtained at 25°C and temperature dependences of the distribution ratios of U(IV) and nitric acid were measured at 15 to 55°C.

32708 **(ORNL/TM—8948) Solvent cleanup using base-treated silica gel solid adsorbent.** Tallent, O.K.; Mailen, J.C.; Pannell, K.D. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 50p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84014096.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A solvent cleanup method using silica gel columns treated with either sodium hydroxide (NaOH) or lithium hydroxide (LiOH) has been investigated. Its effectiveness compares favorably with that of traditional wash methods. After treatment with NaOH solution, the gels adsorb HNO_3, dibutyl phosphate (DBP), UO_2^{2+}, Pu^{4+}, various metal-ion fission products, and other species from the solvent. Adsorption mechanisms include neutralization, hydrolysis, polymerization, and precipitation, depending on the species adsorbed. Sodium dibutyl phosphate, which partially distributes to the solvent from the gels, can be stripped with water; the stripping coefficient ranges from 280 to 540. Adsorption rates are diffusion controlled such that temperature effects are relatively small. Recycle of the gels is achieved either by an aqueous elution and recycle sequence or by a thermal treatment method, which may be preferable. Potential advantages of this solvent cleanup method are that (1) some operational problems are avoided and (2) the amount of $NaNO_3$ waste generated per metric ton of nuclear fuel reprocessed would be reduced significantly. 19 references, 6 figures, 12 tables.

32709 **(DP-tr—69) Thermodynamics of the extraction of uranium and nitric acid from an aqueous solution with TBP/diluent.** Freitas, R.F.deS. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA); Minas Gerais Univ., Belo Horizonte (Brazil). Escola de Engenharia). 8 Jun 1984. Contract AC09-76SR00001. Translation of thesis presented to the Universidade Federal de Minas Gerais, June 1982. 83p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013362.

Portions are illegible in microfiche products.

Herein is a study of a thermodynamically consistent method to predict the equilibrium distribution for uranyl nitrate and nitric acid between an aqueous solution and an organic phase composed of 30 vol % tributyl phosphate (TBP) in a hydrocarbon diluent. An experimental work is developed to obtain equilibrium data for the system of uranyl nitrate, nitric acid, water and 30 vol % TBP in n-dodecane at 25°C and 40°C. The experimental equilibrium data obtained by means of a computer are compared with the experimental results.

0509 Transport And Storage

32710 **(DPSPU—83-124-1) Safety analysis report for packages: packaging of fissile and other radioactive materials. Final report.** Chalfant, G.G. (comp.). (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1984. Contract AC09-76SR00001. 389p. NTIS, PC A17/MF A01; 1; GPO Dep. Order Number DE84013504.

Portions are illegible in microfiche products.

The 9965, 9966, 9967, and 9968 packages are designed for surface shipment of fissile and other radioactive materials where a high degree of containment (either single or double) is required. Provisions are made to add shielding material to the packaging as required. The package was physically tested to demonstrate that it meets the criteria specified in USDOE Order No. 5480.1, chapter III, dated 5/1/81, which invokes Title 10, Code of Federal Regulations, Part 71 (10 CFR 71), Packing and Transportation of Radioactive Material, and Title 49, Code of Federal Regulations, Part 100-179, Transportation. By restricting the maximum normal operating pressure of the packages to less than 7 kg/cm² (gauge) (99 to 54 psig), the packages will comply with Type B(U) regulations of the International Atomic Energy Agency (IAEA) in its Regulations for the Safe Transport of Radioactive Materials, Safety Series No. 6, 1973 Revised Edition, and may be used for export and import shipments. These packages have been assessed for transport of up to 14.5 kilograms of uranium, excluding uranium-233, or 4.4 kilograms of plutonium metal, oxides, or scrap having a maximum radioactive decay energy of 30 watts. Specific maximum package contents are given. This quantity and the configuration of uranium or plutonium metal cannot be made critical by any combination of hydrogeneous reflection and moderation regardless of the condition of the package. For a uranium-233 shipment, a separate criticality evaluation for the specific package is required.

32711 **(PNL—4726) Wet storage integrity update.** Bailey, W.J.; Johnson, A.B. Jr. (Pacific Northwest Lab., Richland, WA (USA)). Sep 1983. Contract AC06-76RL01830. 77p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84014130.

This report includes information from various studies performed under the Wet Storage Task of the Spent Fuel Integrity Project of the Commercial Spent Fuel Management (CSFM) Program at Pacific Northwest Laboratory. An overview of recent developments in the technology of wet storage of spent water reactor fuel is presented. Licensee Event Reports pertaining to spent fuel pools and the associated performance of spent fuel and storage components during wet storage are discussed. The current status of fuel that was examined under the CSFM Program is described. Assessments of the effect of boric acid in spent fuel pool water on the corrosion and stress corrosion cracking of stainless steel and the stress corrosion cracking of stainless steel piping containing stagnant water at spent fuel pools are discussed. A list of pertinent publications is included. 84 references, 21 figures, 11 tables.

32712 **(PNL—5089) Foreign programs for the storage of spent nuclear power plant fuels, high-level waste canisters and transuranic wastes.** Harmon, K.M.; Johnson, A.B. Jr. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1984. Contract AC06-76RL01830. 104p. NTIS, PC A06/MF A01; GPO Dep. Order Number DE84013515.

The various national programs for developing and applying technology for the interim storage of spent fuel, high-level radioactive waste, and TRU wastes are summarized. Primary emphasis of the report is on dry storage techniques for uranium dioxide fuels, but data are also provided concerning pool storage.

0520 Waste Management

32713 **(ANL/EES-TM—246) Radioactive waste isolation in salt: peer review of the Office of Nuclear Waste Isolation's plans for repository performance assessment.** Harrison, W. (Argonne National Lab., IL (USA)). May 1984. Contract W-31-109-ENG-38. 116p. NTIS, PC E06/MF $6.25; GPO Dep. Order Number DE84013677.

Includes 7 sheets of 24x reduction microfiche.

In the peer review of the preliminary performance assessment plan, suggestions to improve the presentation are given, technical issues are addressed, a page-by-page commentary is included, and recommendations are summarized. In the peer review of the verification and validation plan, the following are addressed: suggestions to improve presentation; key activities that have been overlooked; improving the technical content of the plan; and degree to which code documents support the plan. Comments on other supporting code documents, page-by-page commentary, and summary of recommendations are included.

32714 **(BMI/SRP—5011) Well completion report - J. Friemel No. 1 (PD-9) well, Palo Duro Basin, Texas: unanalyzed data.** (Stone and Webster Engineering Corp., Boston, MA (USA)). May 1984. Contract AC06-76RL01830;AC02-83CH10140. 492p. NTIS, PC E18/MF $14.75; 1; GPO Dep. Order Number DE84012670.

Portions are illegible in microfiche products; Includes 42 sheets of 24x reduction microfiche.

This report describes the drilling and testing of J. Friemel No. 1 well, located in north-central Deaf Smith County, approximately 17 miles north of Hereford, Texas. Drilling and testing were performed by Stone and Webster Engineering Corporation as a part of a nationwide program to identify potential locations for a nuclear waste repository. This report describes the drilling and testing activities actually performed (compared to the Field Test Plan), describes the problems encountered, and provides recommendations for future work. Data gathered during drilling and testing of the well are included as appendices to this report. Rigging up and drilling of the rat and mouse holes began on October 15, 1982. The rig was demobilized on March 18, 1983. These data are preliminary. They have been neither analyzed nor evaluated.

32715 **(BNL—34795) Solidification of radioactive waste in a cement/lime mixture.** Zhou, H.; Colombo, P. (Brookhaven National Lab., Upton, NY (USA)). 1984. Contract AC02-76CH00016. 7p. (CONF-840307—46). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013127.

From Waste management '84; Tucson, AZ, USA (11 Mar 1984).

The suitability of a cement/lime mixture for use as a solidification agent for different types of wastes was investigated. This work includes studies directed towards determining the wasted/binder compositional field over which successful solidification occurs with various wastes and the measurement of some of the waste from properties relevant to evaluating the potential for the release of radionuclides to the environment. In this study, four types of low-level radioactive wastes were simulated for incorporation into a cement/lime mixture. These were boric acid waste, sodium sulfate wastes, aion exchange resins and incinerator ash. 7 references, 3 figures, 2 tables.

32716 **(BNL—34796) Full-scale leaching study of commercial reactor waste forms.** Kalb, P.D.; Colombo, P. (Brookhaven National Lab., Upton, NY (USA)). 1984. Contract AC02-76CH00016. 7p. (CONF-840307—44). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013234.

From Waste management '84; Tucson, AZ, USA (11 Mar 1984).

This paper describes a full-scale leaching experiment which has been conducted at Brookhaven National Laboratory (BNL) to study the release of radionuclides from actual commercial reactor waste forms. While many studies characterizing the leaching behavior of simulated laboratory-scale waste forms have been performed, this program represents one of the first attempts in the United States to quantify activity releases for real, full-scale waste forms. 5 references, 5 figures, 1 table.

32717 **(BNL—34825) Leaching of solidified TRU-contaminated incinerator ash.** Fuhrmann, M.; Colombo, P. (Brookhaven National Lab., Upton, NY (USA)). 1984. Contract AC02-76CH00016. 5p. (CONF-840614—63). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013128.

From Annual meeting of the American Nuclear Society; New Orleans, LA, USA (3 Jun 1984).

Leach rate and cumulative fractional releases of plutonium were determined for a series of laboratory-scale waste forms containing transuranic (TRU) contaminated incinerator ash. The solidification agents from which these waste forms were produced are commercially available materials for radioactive waste disposal. The leachants simulate groundwaters with chemical compositions that are indiginous to different geological media proposed for repositories. In this study TRU-contaminated ash was incorporated into waste forms fabricated with portland type I cement, urea-formaldehyde, polyester-styrene or Pioneer 221 bitumen. The ash was generated at the dual-chamber incinerator at the Rocky Flats Plant. These waste forms contained between 1.25×10^{-2} and 4.4×10^{-2} Ci (depending on the solidification agent) of mixed TRU isotopes comprised primarily of ^{239}Pu and ^{240}Pu. Five leachant solutions were prepared consisting of: (1) demineralized water, (2) simulated brine, (3) simplified sodium-dominated groundwater (30 meq NaCl/liter), (4) simplified calcium-dominated groundwater (30 meq $CaCl_2$/liter), and (5) simplified bicarbonate-dominated groundwater (30 meq $NaHCO_3$/liter). Cumulative fractional releases were found to vary significantly with different leachants and solidification agents. In all cases waste forms leached in brine gave the lowest leach rates. Urea-formaldehyde had the greatest release of radionuclides while polyester-styrene and portland cement had approximately equivalent fractional releases. Cement cured for 210 days retained radionuclides three times more effectively than cement cured only 30 days.

32718 **(CONF-831047—100) Evaluation of a processing technique for immobilization of low-level waste.** Armstrong, K.M.; Klingler, L.M. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 1983. Contract AC04-76DP00053. 6p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84002832.

From American Nuclear Society winter meeting; San Francisco, CA, USA (30 Oct 1983).

A commercially available joule-heated glass furnace system is currently being evaluated at Mound as a means of processing low-level radioactive waste typically found in light water reactor facilities. This evaluation has been primarily concerned with determining the effectiveness of the processing technique in the areas of volume reduction and immobilization. The first phase of the evaluation consisted of a series of nonradioactive experiments to determine the combustion efficiency of the furnace and chemical durability of the glass for several waste types deemed representative of power plant effluent streams. Upon completion of this work, radioactive spiked experiments were initiated which will provide, when completed, a comprehensive mass balance and establish volatility trends for several predominant radioisotopes. 1 reference.

32719 **(DOE/NE/93030—T1) Social and economic aspects of radioactive waste disposal: considerations for institutional management.** (National Research Council, Washington, DC (USA). Panel on Social and Economic Aspects of Radioactive Waste Management). 1984. Contract AT01-80NE93030. 185p. NTIS, PC A09/MF A01; GPO Dep. Order Number DE84013409.

Issues addressed in this book include: magnitude, characteristics, and trends of public concerns over radioactive waste; the issue of public trust and confidence in the institutions responsible for radioactive waste management; effects of the number and location of waste repositories on socioeconomic and institutional burdens associated with nuclear waste management; effects associated with interim storage facilities located at reactors or away from reactors; kinds and relative magnitudes of effects associated with the use of alternative forms of transportation (rail, truck, barge); participation by local citizens in identifying, assessing, and proposing ways to ameliorate social and economic siting effects; and potential options for resolving conflict at federal, state, and local levels over repository siting.

32720 **(DOE/NV/10250—14) Commercial nuclear waste research and development program. Quarterly report, January-March 1984.** Hakl, A.R. (Westinghouse Electric Corp., Mercury, NV (USA). Waste Technology Services Div.). Apr 1984. Contract AC08-82NV10250. 48p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84012680.

Activities performed during the second quarter of Fiscal Year (FY) 1984 to meet task objectives of the Nevada Nuclear Waste Storage Investigations FY 1984 Project Plan are reported. A Task 2 Contract Deliverable letter report, summarizing the storage history of all fuel assemblies at the E-MAD facility and documenting the FY 1983 activities involving these fuel assemblies, was prepared and issued. Task 12 Fuel Temperature Test operations were completed for months 10, 11, and 12 temperature profiles; and the month 13 operation was initiated and the profile was met. The Task 16 contractual requirement for semi-annual integrity monitoring of all fuel assemblies at E-MAD was completed for the first half of FY 1984. Fuel assembly D34 integrity monitoring (Task 16) and calorimetry (Task 18) were performed. Fuel assembly B43 was characterized by videotape and still photography and contamination swipe sampled and calorimetered to measure decay heat rate. Prior to their shipment to E-MAD, Material Interaction Test (MIT) capsules, which contain a number of metal and rock specimens in three environments, and Thermal Expansion Device (TED) assemblies, which measured actual maximum temperatures of the fuel assemblies while in storage, were installed in fuel assemblies B03, D01, D04, and D06 at the Battelle Columbus Laboratories. Preparations are being concluded for removal of these capsules and assemblies for shipment to the Westinghouse Hanford Engineering and Development Laboratory in Hanford, Washington. Quality Assurance personnel continued preparation of 17 procedures for the DOE/NV Quality Assurance Procedure manual, as authorized under Task 23.

32721 **(DOE/SR—84-SPP) Text of slides prepared 1/20/84 for presentation regarding underrun funds.** (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 20 Jan 1984. Contract AC09-76SR00001. 8p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013158.

32722 **(DOE/SR/00001—T27) SRP hazardous waste monitor well report.** Roberts, J.S. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 30 Dec 1983. Contract AC09-76SR00001. 3p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013160.

This well report for the third quarter of 1983 contains the data required by South Carolina Hazardous Waste Management Regulations for wells located at 200-F and 200-H seepage basins, 300-M settling basin, and Building 709-G.

32723 **(DP-MS—83-126) Remotely replaceable jumpers and embedded wiring for the DWPF.** Heckendorn, F.M. II. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1984. Contract AC09-76SR00001. 15p. (CONF-840614—64). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013168.

From Annual meeting of the American Nuclear Society; New Orleans, LA, USA (3 Jun 1984).

Portions are illegible in microfiche products.

The Defense Waste Processing Facility (DWPF) for radioactive waste vitrification at the Savannah River Plant (SRP) is now under construction. Development of specialized electrical/instrument inter-connectors, or jumpers, is now complete. Remote replacement of the associated through-wall wiring using a standard canyon crane has also been demonstrated. 8 figures.

32724 **(DP-MS—84-7) Savannah River Plant low-level waste incinerator demonstration.** Tallman, J.A. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1984. Contract AC09-76SR00001. 6p. (CONF-840614—62). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013364.

From Annual meeting of the American Nuclear Society; New Orleans, LA, USA (3 Jun 1984).

A two-year demonstration facility was constructed at the Savannah River Plant (SRP) to incinerate suspect contaminated solid and low-level solvent wastes. Since startup in January 1984, 4460 kilograms and 5300 liters of simulated (uncontaminated) solid and solvent waste have been incinerated to establish the technical and operating data base for the facility. Combustion safeguards have been enhanced, process controls and interlocks refined, some materials handling problems identified and operating experience gained as a result of the 6 month cold run-in. Volume reductions of 20:1 for solid and 25:1 for solvent waste have been demonstrated. Stack emissions (NO_2, SO_2, CO, and particulates) were only 0.5% of the South Carolina ambient air quality standards. Radioactive waste processing is scheduled to begin in July 1984. 2 figures, 2 tables.

32725 **(DPST—76-345-Del.Ver.) Treatment faciliy for 200 Area seepage basin waste. Technical data summary.** Horton, J.H.; McKibbin, J.G. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.; Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 23 Jun 1976. Contract AC09-76SR00001. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013165.

Portions are illegible in microfiche products.

A combination of flocculation followed by ion exchange has been selected as the appropriate treatment for 200 Area waste. A water treatment plant based on this process is described.

32726 **(DPST—79-433) Decontamination of canister and overpack.** Ondrejcin, R.S. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 10 Jul 1979. Contract AC09-76SR00001. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013175.

Portions are illegible in microfiche products.

In the solidification of waste in glass, it is assumed that the primary container (Canister) and the secondary container (Overpack) will become radioactively contaminated. Decontamination will therefore be required. For the in-can melting concept the Canister will be stainless steel. For continuous melting, stainless steel is the reference design, but carbon steel is still being considered. In both concepts carbon steel is the reference design for the overpack. There is some question at present whether an overpack will be used. Since decontamination is to be a remote operation, simplicity is an extremely desirable feature. For this reason the method of immersion of the material to be decontaminated with dissolution of the surface, was chosen rather than a more complex system such as electropolishing. Results from tests using HNO_3-HF solution followed by immersing in either oxalic acid or EDTA solution are given. The HNO_3-HF solution dissolved 0.020 to 0.030 in. of glass adhering to the outer steel surface during decontamination. Greater thicknesses of glass will have to be physically removed if it sticks to the metal.

32727 **(INIS-mf—8325) Investigations on kind and quantity of water contained in permian rock salt and its release and migration in the temperature field of deposited radioactive wastes.** Jockwer, N. (Technische Univ. Clausthal, Clausthal-Zellerfeld (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). 15 Jun 1981. 134p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84780316.

The direct influence of heat-generating wastes on natural salt rocks, their side-minerals and their water components was investigated. The equations established in this study led to the conclusion that the gradient of water concentration in the pore spaces is a principal strength influencing the migration mechanism. This gradient - indicating the relation between drilling hole and pore space in mountaineous areas - depends on the decomposition of water due to radiolysis, corrosion and the degree of compactness of the borehole. Since certain environmental conditions (e.g. maximum mountain temperature etc). are not yet cleared up, the author renounced on calculating the amounts of water seeping away into the borehole. (DG).

32728 **(INIS-mf—8975) International co-operation for safe radioactive waste management.** (Nuclear Energy Agency, 75 - Paris (France)). 1983. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84702046.

As a specialised inter-governmental body, NEA pursues three main objectives for its radioactive waste management programme: (1) the promotion of studies to improve the data base available in support of national programmes; (2) the support of research and development through coordination of national activities and promotion of international projects; and (3) an improvement in the general level of understanding of waste management issues and options, particularly in the field of waste disposal. The management of radioactive waste from nuclear activities covers several sequences of complex technical operations; however, as the ultimate objective of radioactive waste management is the disposal of the waste, the largest part of the work programme is directed towards the analysis of disposal options. In addition, NEA is active in various other areas of waste management, such as the treatment and conditioning of waste, the decommissioning of nuclear facilities and the institutional aspects of the long term management of radioactive waste.

32729 **(KFK—3612) Mathematical modelling of the corrosion and leaching behaviour of cemented waste forms.** Kienzler, B.; Korthaus, E.; Koester, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). Nov 1983. 53p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751491.

Essential processes which may lead to a radionuclide release from a cemented waste form, in addition to diffusion, are dissolution processes, changing of solubilities and effective diffusion constants caused by chemical reactions, as well as forced fluid movement by variation of the pore volume in the hydrated cement paste. The mobilization and the transportation process can be calculated for a homogeneous cemented waste form by means of diffusion equation extended by dissolution and fluid movement terms. By introduction of effective constants the complex structure of the hardened cement paste will be homogenised mathematically. In the case of Cs leaching the effective constants describing the release process is the diffusion constant, whereas for Sr leaching the constants are the maximum solubilities of the Sr-compounds in the pore fluid of the cement and their dissolution kinetics. Release rates computed from the solution of the differential equations are compared with experimental data to evaluate the essential constants. To do this the computer code "DIFMOD" was developed, which computes the concentrations of the interesting substances in a specimen as a function of different parameters of influence. The procedure used is an implicit Crank-Nicolson finite difference formula.

32730 **(LBL—17745) Geochemistry research planning for the underground storage of high-level nuclear waste.** Apps, J.A. (Lawrence Berkeley Lab., CA (USA)). Sep 1983. Contract AC03-76SF00098. 205p. NTIS, PC A10/MF A01. Order Number DE84013399.

Portions are illegible in microfiche products.

This report is a preliminary attempt to plan a comprehensive program of geochemistry research aimed at resolving problems connected with the underground storage of high-level nuclear waste. The problems and research needs were identified in a companion report to this one. The research needs were taken as a point of departure and developed into a series of proposed projects with estimated manpowers and durations. The scope of the proposed research is based on consideration of an underground repository as a multiple barrier system. However, the program logic and organization reflect conventional strategies for resolving technological problems. The projects were scheduled and the duration of the program, critical path projects and distribution of manpower determined for both full and minimal programs. The proposed research was then compared with ongoing research within DOE, NRC and elsewhere to identify omissions in current research. Various options were considered for altering the scope of the program, and hence its cost and effectiveness. Finally, recommendations were made for dealing with omissions and uncertainties arising from program implementation. 11 references, 6 figures, 4 tables.

32731 **(NUREG/CR—3489) Assessment of retrieval alternatives for the geologic disposal of nuclear waste. Final report.** Kendorski, F.S.; Hambley, D.F.; Wilkey, P.L. (Engineers International, Inc., Westmont, IL (USA)). May 1984. 660p. NTIS, PC A99/MF A01 - GPO $11.00. Order Number DE84901376.

Portions are illegible in microfiche products.

Currently, the most feasible alternative for permanent disposal of high-level nuclear waste is storage in deep underground repositories in geologic media. Uncertainties in investigation, design and construction necessitate maintaining the retrieval option until the isolation is proven likely. Investigations were limited to concepts in geologic media (tuff, salt, and basalt) currently being investigated by DOE. Retrieval in most concepts is not a simple reversal of waste emplacement. This study identified several concerns. Technological concerns are associated with remining and monitoring radioactivity in backfilled storage rooms and retrieval of breached canisters. Retrieval systems currently incorporated into DOE designs were found inadequate for handling breached canisters or those bound in the storage holes. Short holes containing single canisters could be overcored, but equipment must be developed to overcore large diameter holes. Safety concerns common to all repository concepts are protection of personnel from heat, traffic congestion, and deterioration of ground support. Concerns on radionuclide release were the radiation and radionuclides which would be released into the air and water present in a storage room if there were a canister breach. The confinement ventilation circuit air-flows provided in the DOE conceptual designs are just adequate for retrieval and are inadequate for retrieval from backfilled rooms.

32732 **(ORNL/TM—8901) Development of quality assurance and performance testing for the Process Experimental Pilot Plant.** Dole, L.R.; McDaniel, E.W.; Robinson, S.M. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 33p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013106.

The Process Experimental Pilot Plant (PREPP) is planned for operation by EG and G Idaho, Inc., to demonstrate a full-scale, cement-based, disposal process for transuranic (TRU) wastes. Procedures need to be developed to determine the quality of the waste product during processing and the durability of the final waste form produced in this facility. This report summarizes basic guidelines for the selection of the waste form composition and process conditions that affect product performance. Physical property tests that may be applicable for quality assurance during processing are also described. Approaches to accelerated performance tests needed to predict the performance of the cement-based waste form are identified, and suggestions are made for the development of processing tests to assure the quality of the final waste-host product. 29 references, 3 figures, 3 tables.

32733 **(ORNL/TM—9003) Feasible modifications for the low-level waste treatment plant at Oak Ridge National Laboratory.** Chilton, J.M. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 12p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013113.

Aqueous, low-level, radioactive wastes at Oak Ridge National Laboratory (ORNL) contain small amounts of ^{60}Co, ^{90}Sr, ^{137}Cs, and trace amounts of other radionuclides. These wastes are processed by passage through beds of a strong-acid cation exchange resin, and the treated water is then discharged to the environment. Studies show that pretreatment of the waste with a weak-acid cation exchange resin would result in a significant decrease in regeneration reagents and a saving of manpower. This can be accomplished in the present plant by piping changes on the existing columns. The effluent from the cation treatment process contains all of the radionuclides that are present in anionic form. Routinely, this consists only of approximately one-half of the ^{60}Co. Under certain conditions, other anions (such as ^{131}I) could be present. Studies show that these can be removed by use of an anion exchange resin bed at the end of the process. This would require the construction of an additional column, if the head-end treatment described above is also installed. 2 references, 2 figures, 2 tables.

32734 **(ORNL/TM—9014) Design and construction of a French drain for groundwater diversion in solid waste storage area six at the Oak Ridge National Laboratory.** Davis, E.C.; Stansfield, R.G. (Oak Ridge National Lab., TN (USA)). May 1984. Contract AC05-84OR21400. 77p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013622.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Engineering modifiations or engineered barriers have been suggested as a possible means of improving the performance of low-level waste disposal sites located in the humid eastern United States. Design and construction of a passive French drain, located in Solid Waste Storage Area No. 6 at the Oak Ridge National Laboratory. The drain was designed to hydrologically isolate a 0.44-ha area that contains a group of 49 low-level waste trenches by separating it from upgradient groundwater recharge areas. The 252-m drain (maximum depth = 9 m) that surrounds the group of trenches on the north and east sides was excavated, lined with filter fabric, backfilled with crushed stone, and covered with a 0.6 m layer of excavated material at an estimated cost of $153,000. Of the 17 days it took to complete the work, about 5 days were spent excavating sidewall slide material that fell into the drain during excavation. Photography of the drain wall revealed the contorted structure of the weathered shale, which was responsible for many of the slides. Monitoring wells placed at intervals on the drain centerline indicate that groundwater is draining from the surrounding Maryville Formation (Conasauga Group); flows at catch basin No. 2 ranged from a base flow of 4 to 7 L/min to a maximum of 35 L/min, recorded on October 13. In response to groundwater flow in the drain, water levels in several monitoring wells adjacent to the drain have dropped by as much as 2.24 m to an elevation only slightly higher than the bottom of the French drain. In addition to the general lowering of the water table in the vicinity of the drain, water levels in three trenches began to subside, indicating that the drain is beginning to have an effect on the water in the trenches as well. Further monitoring of both drain discharge and water levels in monitoring wells across the site is continuing.

32735 **(PB—84-157353) Storage stability of bituminized reactor wastes.** Peltonen, P.; Niemi, A. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Reaktorilab.). 1983. 87p. NTIS, PC E05/MF E01.

The aim of the research was to study the protection given by bitumen for nuclear waste in conditions of ground water storage during a time equivalent to the half-life of low and medium level radionuclides. The quality changes of bitumen and resin and bitumen mixtures were analyzed by means of standard tests both before and after storage. The proportional distribution of bitumen components underwent a change already in a short-term storage: the number of asphaltenes rose and the resin and asphaltene ratio decreased. This, the rise in stiffness and growing compressibility indicate a slight embrittlement of bitumen. Bitumen repels water but diffusion of water may take place through a damaged bitumen film.

Water penetrating under the films on the resin surface weakens adhesion. The considerable swelling of resins and internal gas formation weaken adhesion and also promote leaching. These phenomena noticeably weaken the effect of the otherwise excellent waterproofing properties of bitumen. To eliminate the risk of leaching the research report recommends that the steel drums be made thicker and that the amount of bitumen be increased depending on the degree of fineness of the resin type in question.

32736 **(PNL-SA—12126) Uranium mill tailings remedial action technology.** Hartley, J.N.; Gee, G.W. (Pacific Northwest Lab., Richland, WA (USA)). 1984. Contract AC06-76RL01830. 24p. (CONF-8406142—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013405.

From Hazardous materials management conference; Philadelphia, PA, USA (5 Jun 1984).

The uranium milling process involves the hydrometallurgical extraction of uranium from ores and the resultant generation of large quantities of waste referred to as tailings. Uranium mill tailings have been identified as requiring remediation because they contain residual radioactive material that is not removed in the milling process. Potential radiation exposure can result from direct contact with the tailings, from radon gas emitted by the tailings, and from radioactive contamination of groundwater. As a result, the technology developed under the US Department of Energy (DOE) Uranium Mill Tailings Remedial Action Project (UMTRAP) and the US Nuclear Regulatory Commission (NRC) Uranium Recovery Program have focused on radon control, groundwater contamination and the long-term protection of the containment system. This paper briefly summarizes the UMTRAP and NRC remedial action technology development. 33 references, 9 figures, 5 tables.

32737 **(PNL-SA—12282) Features of a radioactive liquid-fed ceramic melter system.** Holton, L.K. Jr.; Berger, D.N.; Bjorklund, W.J.; Dierks, R.D. (Pacific Northwest Lab., Richland, WA (USA)). 1984. Contract AC06-76RL01830. 29p. (CONF-840614—59). NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013266.

From Annual meeting of the American Nuclear Society; New Orleans, LA, USA (3 Jun 1984).

Pacific Northwest Laboratory has remotely installed a Pilot-Scale Radioactive Liquid-Fed Ceramic Melter (RLFCM) System for conversion of high-level liquid wastes to borosilicate glass in shielded manipulator cells located at Hanford, Washington. The Pilot-Scale RLFCM System consists of a RLFCM, canister handling turnable, glass-level detection system and supporting waste preparation, off-gas treatment, and condensate treatment racks. The Pilot-Scale RLFCM System, which incorporates many of the design features planned for production-scale waste vitrification facilities, will be operated with radioactive wastes to test remote equipment features. Special devices were designed and engineered to assist in remote installation operation and maintenance of the equipment system. This paper discusses the remote features of this vitrification system.

32738 **(RHO-BW-SA—311-P) Disruption scenario analysis for a nuclear waste repository in Hanford Site basalts, Washington State.** Davis, J.D.; Runchal, A.K. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations; Analytic and Computational Research, Inc., Los Angeles, CA (USA)). 1984. Contract AC06-77RL01030. 11p. (CONF-840307—45). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013200.

From Waste management '84; Tucson, AZ, USA (11 Mar 1984).

An initial application was made of the Delphi method of expert opinion consensus-forming to disruption scenario analysis of a candidate high-level nuclear waste repository at the Hanford Site, Washington State. Expert scientific and engineering opinion was elicited for the purpose of identifying, categorizing, and ranking of site-specific scenarios within the framework of occurrence-probability categories established by the US Nuclear Regulatory Commission and the US Environmental Protection Agency. After refinement by a second Delphi iteration, the disruption scenarios selected to be of most concern will be characterized in detail for use in assessing long-term repository performance under disruption scenario conditions. 3 references, 4 figures, 2 tables.

32739 **(SAND—82-1977) Effective stress principle for partially saturated media.** McTigue, D.F.; Wilson, R.K.; Nunziato, J.W. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1984. Contract AC04-76DP00789. 50p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013630.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

In support of the Nevada Nuclear Waste Storage Investigation (NNWSI) Project, we have undertaken a fundamental study of water migration in partially saturated media. One aspect of that study, on which we report here, has been to use the continuum theory of mixtures to extend the classical notion of effective stress to partially saturated media. Our analysis recovers previously proposed phenomenological representations for the effective stress in terms of the capillary pressure. The theory is illustrated by specializing to the case of linear poroelasticity, for which we calculate the deformation due to the fluid pressure in a static capillary fringe. We then examine the transient consolidation associated with liquid flow induced by an applied surface load. Settlement accompanies this flow as the liquid is redistributed by a nonlinear diffusion process. For material properties characteristic of tuff from the Nevada Test Site, these effects are found to be vanishingly small. 14 references, 7 figures, 1 table.

32740 **(SAND—83-0372) Unit evaluation at Yucca Mountain, Nevada Test Site: summary report and recommendation.** Johnstone, J.K.; Peters, R.R.; Gnirk, P.F. (Sandia National Labs., Albuquerque, NM (USA); RE/SPEC, Inc., Rapid City, SD (USA)). Jun 1984. Contract AC04-76DP00789. 95p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013650.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Of the four potential repository units, identified at Yucca Mountain, two potential units the welded, devitrified portions of the Bullfrog and Tram Members of the Crater Flat Tuff are below the water table. The welded, devitrified Topopah Spring Member of the Paintbrush Tuff and the nonwelded, zeolitized Tuffaceous Beds of Calico Hills are above the water table. The results of a study of the four potential repository units are to provide a technical basis for selecting a single target repository unit for future test and evaluation. The unit evaluation studies compared the units rather than provided and absolute assessment. The four ranking evaluation criteria used were: radionuclide isolation time; allowable repository gross thermal loading; excavation stability; and relative economics. Considered the most important of the criteria as well as the most difficult, radionuclide isolation times were estimated using the limited existing data. The allowable repository gross thermal loadings determined from near-field calculations, were nearly the same for all four units. The gross thermal loading supported other criteria by providing the heat source for succeeding thermally related evaluation studies. A large number of studies evaluated excavation stability, including near-field mechanical and thermomechanical finite element code calculations studies. A large number of studies evaluated excavation stability, including near-field mechanical and thermomechanical finite element code calculations, rock matrix property evaluation, and rock mass classification. Relative economics, a minor criterion, did not play an explicit role in the final ranking. Based on all of the analyses, the final recommendation was that the Topopah Springs be selected as the target unit, followed, in order, by the Calico Hills, Bullfrog, and Tram.

32741 **(UCRL—53521) Hydrothermal interaction studies of Bullfrog Member tuff core wafers in J-13 water at 150°C: quantitative analyses of aqueous and solid phases.** Knauss, K.G. (Lawrence Livermore National Lab., CA (USA)). Feb 1984. Contract W-7405-ENG-48. 26p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84014422.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This paper describes the experimental work conducted to understand the water chemistry in the near-field surrounding a nu-

clear waste repository in the Bullfrog Member of the Crater Flat Tuff, Nev., and to study any changes in the rock itself due to hydrothermal alteration. The work is part of the Nevada Nuclear Waste Storage Investigations (NNWSI) Project to determine the suitability of the volcanic units at Yucca Mountain for storing high-level nuclear wastes. Static hydrothermal experiments with polished core wafers were run for 60 d; all faces of the core wafers were exposed to solution. Quantitative solution analyses indicate that the solution chemistry for both crushed tuff and solid core wafers is in good agreement. Analyses of the solid phases suggest that the extent of reaction, at least over the 60-d period, is relatively minor, even though solution effects were observed. These experiments show that conditions in a repository located in the Bullfrog Member would be relatively benign with respect to waste form and waste package survival. 4 references 10 figures, 4 tables.

32742 **(UCRL—90846) Overview of geochemical modeling needs for nuclear waste management.** Isherwood, D.; Wolery, T. (Lawrence Livermore National Lab., CA (USA)). 25 May 1984. Contract W-7405-ENG-48. 8p. (CONF-8406134—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012807.

From Workshop on fundamental geochemistry needs for nuclear waste isolation; Los Alamos, NM, USA (20 Jun 1984).

Research needs include, but are not limited to: measurement of basic thermodynamic data at elevated temperatures for species identified by modelers as potentially important; evaluation of substances which control or limit precipitation and/or nucleation kinetics; sorption studies specifically designed to provide data needed for modeling. This includes the rate of sorption, desorption, and the characterization of the solid and aqueous phases; site-mixing models and thermodynamic data for secondary minerals that form solid solutions; the development of standard techniques for measuring rate laws for precipitation and dissolution kinetics; and measurement of rate laws describing redox kinetics, dissolution, and precipitation involving aqueous species and solid phases of interest to geochemical modelers.

32743 **(USGS/WRIR—83-4032) Geohydrology of test well USW H-1, Yucca Mountain, Nye County, Nevada.** Rush, F.E.; Thordarson, W.; Pyles, D.G. (Geological Survey, Denver, CO (USA). Water Resources Div.). 1984. Contract AI08-78ET44802. 62p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013680.

This report contains the results of hydraulic testing, hydrologic monitoring, and geophysical logging of test well USW H-1, one of several wells drilled in the southwestern part of the Nevada Test Site in cooperation with the US Department of Energy for investigations related to the isolation of high-level radioactive wastes. All rocks penetrated by the well to a total depth of 1829 meters were of volcanic origin and of Tertiary age. Hydraulic head in the zone 688 to 741 meters below land surface was 730 meters above sea level and at a depth of 572 meters below land surface. Deeper zones had hydraulic heads of 781 meters above sea level or higher, indicating an upward component of ground-water flow at the site. The most transmissive zone, with an apparent transmissivity of about 150 meters squared per day, is in the Prow Pass Member of the Crater Flat Tuff in the depth range from 572 to 688 meters below land surface. The remainder of the penetrated rocks in the saturated zone, 688 to 1829 meters, has an apparent transmissivity of about 1 meter squared per day. The most transmissive part of the lower depth range is in the Bullfrog Member of the Crater Flat Tuff in the depth interval from 736 to 741 meters. The apparent hydraulic conductivity of the rocks in this lower depth interval from 688 to 1829 meters commonly ranges between 10^{-4} and 10^{-7} meter per day. Water chemistry is typical of tuffaceous rocks of southern Nevada. The water is a sodium bicarbonate type and has an apparent age of 12,000 to 13,000 years before present, as determined by carbon-14 dating.

32744 **Nuclear waste management: issues and progress.** Kittel, J.H. (Argonne National Lab., IL). *Journal of Environmental Sciences;* **27**: No. 2, 34-41(Mar-Apr 1984).

Progress and institutional issues are discussed that surround the management of spent nuclear fuel and the principal types of nuclear waste. Legislation is described that has been enacted to facilitate difficult political decisions on how waste disposal sites are to be selected. Finally, a summary is given of emerging technology for converting valuable nuclear waste byproducts to useful purposes such as food preservation. 60 references.

32745 **Phenolic cation exchange resin material for recovery of cesium and strontium.** Ebra, M.A.; Wallace, R.M. (to US Dept. of Energy). US Patent 4,423,159. 27 Dec 1983. Filed date 5 May 1982. vp.

PAT-APPL-375232.

A phenolic cation exchange resin with a chelating group has been prepared by reacting resorcinol with iminodiacetic acid in the presence of formaldehyde at a molar ratio of about 1:1:6. The material is highly selective for the simultaneous recovery of both cesium and strontium from aqueous alkaline solutions, such as, aqueous alkaline nuclear waste solutions. The organic resins are condensation polymers of resorcinol and formaldehyde with attached chelating groups. The column performance of the resins compares favorably with that of commercially available resins for either cesium or strontium removal. By combining Cs^{+} and Sr^{2+} removal in the same bed, the resins allow significant reduction of the size and complexity of facilities for processing nuclear waste.

Groundwater in the vicinity of M Area has been found to be contaminated with metal degreasing solvents. The solvents originated from surface sources such as the M-Area settling basin, sewer pipeline, solvent storage tank, and the tributary to Tims Branch. The spatial extent of the groundwater contamination has been defined but not completely characterized. A remedial action program for cleaning up the affected groundwater has been proposed. This technical summary contains the basis for and the details of the proposed M-Area groundwater recovery and treatment process.

32753 **(DPST—83-829-Draft) SRP groundwater protection implementation plan. Draft.** (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Atomic Energy Div.). 1983. Contract AC09-76SR00001. 29p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013156.

Portions are illegible in microfiche products.

Maintaining the quality of the Savannah River Plant environment and protecting offsite areas from the impact of facility operations were recognized as important goals prior to site startup. Monitoring programs were initiated in the Savannah River and on the site to establish baseline conditions before facility operations began. These programs by plant personnel and other scientific groups have been significantly expanded during the 30 years of operation. Monitoring results cover airborne effluents and surface and subsurface waters. Analyses include both radioactive and nonradioactive species. These programs have established the Savannah River site as one of the most extensively monitored locations in the world. These activities are the foundation of a broad based environmental program which has consistently demonstrated the negligible environmental impact of the site's operations on the general public. In addition to the extensive monitoring program, many advances in effluent treatment technology have been incorporated in plant facilities. There is no immediate threat of any kind to the on- or offsite population.

Site geohydrology, and solid and hazardous wastes.** Christensen, E.J.; Gordon, D.E. (eds.). (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Dec 1983. Contract AC09-76SR00001. 516p. NTIS, PC A22/MF A01; 1; GPO Dep. Order Number DE84013347.

Portions are illegible in microfiche products.

The program for protecting the quality of groundwater underlying the Savannah River Plant (SRP) is described in this technical summary report. The report is divided into two volumes. Volume I contains a discussion of the general site geohydrology and of both active and inactive sites used for disposal of solid and hazardous wastes. Volume II includes a discussion of radioactive waste disposal. Most information contained in these two volumes is current as of December 1983. The groundwater quality protection program has several elements which, taken collectively, are designed to achieve three major goals. These goals are to evaluate the impact on groundwater quality as a result of SRP operations, to restore or protect groundwater quality by taking corrective action as necessary, and to ensure disposal of waste materials in accordance with regulatory guidelines.

32755 **(LBL—15050) Field determination of the hydrologic properties and parameters that control the vertical component of groundwater movement.** Javandel, I. (Lawrence Berkeley Lab., CA (USA)). Mar 1983. Contract AC03-76SF00098. 130p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013859.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The vertical movement of groundwater through geologic formations generally constitutes the shortest pathway for transport of contaminated fluid from polluted aquifers to the accessible environment. If such movement is encouraged by unfavorable conditions such as an upward hydraulic gradient or relatively permeable zones, it could jeopardize the safety of an underground nuclear waste repository. In this report, a description has been attempted of some of the conventional techniques for measurement of the properties and parameters which control the vertical movement and travel time of groundwater. The most important properties and parameters which control the vertical movement and travel time of groundwater are the effective porosity, hydraulic conductivity, and storativity of the geologic media, and the distribution of hydraulic head within the formations around the repository. Given a candidate repository site, a thorough knowledge of the magnitude and variation of these parameters within the adjacent geologic formations is essential in evaluating the safety of the site. Determination of these parameters in aquifers has been a routine task for hydrologists for several decades. In tight formations or scarcely fractured media which have little or no significance from a water supply point of view, conventional methods are not reliable. During recent years when the need for further information has increased, some new techniques have been developed. However, these methods are far from complete and in some cases there is much room for improvement.

32756 **(NUREG/CR—3316) Verification and field comparison of the Sandia Waste-Isolation Flow and Transport Model (SWIFT).** Ward, D.S.; Reeves, M.; Duda, L.E. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1984. Contract AC04-76DP00789. 168p. (SAND—83-1154). NTIS, PC A08/MF A01; 1 - GPO $6.50; GPO Dep. Order Number DE84013760.

Portions are illegible in microfiche products.

The SWIFT Model has been developed and maintained by Sandia National Laboratories. The Nuclear Regulatory Commission has sponsored this work under its high-level nuclear waste program. SWIFT is a fully-coupled, transient, three-dimensional model. It is implemented by a finite-difference code which solves the equations for flow and transport in geologic media and is used to evaluate repository-site performance. This document represents an important part of the quality-assurance records for the code. Here the process simulators for flow, heat and radionuclide transport are examined using two different types of tests. The analytical verifications test SWIFT calculations against analytical solutions, and the field comparisons test SWIFT calculations against field data. Both types of tests yield good agreement between the SWIFT computations and the comparative data. 35 references, 56 figures, 25 tables.

32757 **(NUREG/CR—3378) Verification of the network flow and transport/distributed velocity (NWFT/DVM) computer code.** Duda, L.E. (Sandia National Labs., Albuquerque, NM (USA)). May 1984. Contract AC04-76DP00789. 47p. (SAND—83-1466). NTIS, PC A03/MF A01; 1 - GPO $4.00; GPO Dep. Order Number DE84012304.

Portions are illegible in microfiche products.

The Network Flow and Transport/Distributed Velocity Method (NWFT/DVM) computer code was developed primarily to fulfill a need for a computationally efficient ground-water flow and contaminant transport capability for use in risk analyses where, quite frequently, large numbers of calculations are required. It is a semi-analytic, quasi-two-dimensional network code that simulates ground-water flow and the transport of dissolved species (radionuclides) in a saturated porous medium. The development of this code was carried out under a program funded by the US Nuclear Regulatory Commission (NRC) to develop a methodology for assessing the risk from disposal of radioactive wastes in deep geologic formations (FIN: A-1192 and A-1266). In support to the methodology development program, the NRC has funded a separate Maintenance of Computer Programs Project (FIN: A-1166) to ensure that the codes developed under A-1192 or A-1266 remain consistent with current operating systems, are as error-free as possible, and have up-to-date documentations for reference by the NRC staff. Part of

this effort would include verification and validation tests to assure that a code correctly performs the operations specified and/or is representing the processes or system for which it is intended. This document contains four verification problems for the NWFT/DVM computer code. Two of these problems are analytical verifications of NWFT/DVM where results are compared to analytical solutions. The other two are code-to-code verifications where results from NWFT/DVM are compared to those of another computer code. In all cases NWFT/DVM showed good agreement with both the analytical solutions and the results from the other code.

32758 (ORNL—6061) Geochemical information for the West Chestnut Ridge Central Waste Disposal Facility for low-level radioactive waste. Seeley, F.G.; Kelmers, A.D. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 226p. NTIS, PC A11/MF A01; 1; GPO Dep. Order Number DE84013765.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Geochemical support activities for the Central Waste Disposal Facility (CWDF) project included characterization of site materials, as well as measurement of radionuclide sorption and desorption isotherms and apparent concentration limit values under site-relevant laboratory test conditions. The radionuclide sorption and solubility information is needed as input data for the pathways analysis calculations to model expected radioactivity releases from emplaced waste to the accessible environment under various release scenarios. Batch contact methodology was used to construct sorption and desorption isotherms for a number of radionuclides likely to be present in waste to be disposed of at the site. The sorption rates for uranium and europium were rapid (> 99.8% of the total radionuclide present was adsorbed in ~ 30 min). With a constant-pH isotherm technique, uranium, strontium, cesium, and curium exhibited maximum Rs values of 4800 to > 30,000 L/kg throughout the pH range 5 to 7. Sorption ratios were generally lower at higher or lower pH levels. Retardation factors for uranium, strontium, and cesium, explored by column chromatographic tests, were consistent with the high sorption ratios measured in batch tests for these radionuclides. The addition of as little as 0.01 M organic reagent capable of forming strong soluble complexes with metals [e.g., ethylenediaminetetraacetic acid (EDTA) or citric acid] was found to reduce the sorption ratio for uranium by as much as two orders of magnitude. Substitution of an actual low-level waste site trench water for groundwater in these tests was found to give a similar reduction in the sorption ratio.

32759 (PNL-SA—12284) Some statistical and sampling needs for detecting spills or migration at commercial low-level radioactive waste disposal sites. Thomas, J.M.; Eberhardt, L.L.; Skalski, J.R.; Simmons, M.A. (Pacific Northwest Lab., Richland, WA (USA)). May 1984. Contract AC06-76RL01830. 14p. (CONF-8405195—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013248.

From State Radiation Program Directors conference; Des Moines, IA, USA (21 May 1984).

Portions are illegible in microfiche products.

As part of a larger study funded by the US Nuclear Regulatory Commission we have been investigating field sampling strategies and compositing as a means of detecting spills or migration at commercial low-level radioactive waste disposal sites. The overall project is designed to produce information for developing guidance on implementing 10 CFR part 61. Compositing (pooling samples) for detection is discussed first, followed by our development of a statistical test to allow a decision as to whether any component of a composite exceeds a prescribed maximum acceptable level. The question of optimal field sampling designs and an Apple computer program designed to show the difficulties in constructing efficient field designs and using compositing schemes are considered. 6 references, 3 figures, 3 tables.

From 6. congress of the International Radiation Protection Association; Berlin, F.R. Germany (7 May 1984).

Portions are illegible in microfiche products.

The accident at the Three Mile Island nuclear power reactor in March 1979 and subsequent investigations identified serious concerns involving several aspects of radiation protection programs in general. Battelle, Pacific Northwest Laboratories was contracted by the United States Nuclear Regulatory Commission to characterize and evaluate radiation protection programs at power reactors, uranium mills and commercial low-level waste disposal sites in the United States. These evaluations were termed appraisals because they were structured to facilitate an integrated look at the total radiation protection programs, delve into areas for which explicit regulatory requirements did not exist, and emphasize evaluation of capability and performance rather than compliance with regulations. This paper contains some of the results of 48 power reactor appraisals, 10 uranium mill appraisals and 3 commercial low-level waste disposal site appraisals. The appraisal scope and methodology as well as summary findings and conclusions will be discussed. It was observed from this effort that there is a difference in the adequacy of radiation protection programs as compared between the three types of nuclear facilities. It was observed, based on the risks involved, that the program elements at low-level waste disposal sites and power reactors were substantially better than at the uranium mills. 3 references.

From 8. world conference on earthquake engineering; San Francisco, CA, USA (21 Jul 1984).

Identification of the elements of typical hazardous waste facilities (HFWs) that are the major contributors to the risk are focussed on as the elements which require additional considerations in the design and construction of low-level nuclear waste management repositories and HWFs. From a recent study of six typical HWFs it was determined that the factors that contribute most to the human and environmental risk fall into four basic categories: geologic and seismological conditions at each HWF; engineered structures at each HWF; environmental conditions at each HWF; and nature of the material being released. In selecting and carrying out the six case studies, three groups of hazardous waste facilities were examined: generator industries which treat or temporarily store their own wastes; generator facilities which dispose of their own hazardous wastes on site; and industries in the waste treatment and disposal business. The case studies have a diversity of geologic setting, nearby settlement patterns, and environments. Two sites are above a regional aquifer, two are near a bay important to regional fishing, one is in rural hills, and one is in a desert, although not isolated from nearby towns and a groundwater/surface-water system. From the results developed in the study, it was concluded that the effect

of seismic activity on hazardous facilities poses a significant risk to the population. Fifteen reasons are given for this conclusion.

32763 (BNL—34804-Draft) Parameters for several plutonium nuclides and ^{252}Cf of safeguards interest. Zucker, M.S.; Holden, N.E. (Brookhaven National Lab., Upton, NY (USA)). 1984. Contract AC02-76CH00016. 42p. (CONF-840531—12-Draft). NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013227.

From 6. annual symposium on safeguards and nuclear material management; Venice, Italy (14 May 1984).

Sets of the neutron emission multiplicity distribution gleaned from the literature for plutonium nuclides and ^{252}Cf are considered. A methodology for rendering the different sets comparable is presented and used to convert the sets to a common basis such that the differences can be evaluated objectively and that allows realistic estimate of the uncertainties. This in turn permits development of a canonical consensus set in certain instances. Evaluated data on the average neutron multiplicity, the total half-lives, and the half-lives for spontaneous fission are also given. A careful search of the literature reveals that the data on neutron multiplicity distributions for many nuclides is surprisingly sparse, considering that almost thirty years has elapsed since the original pioneering work, which in some cases, yield the only reported value. 93 references, 26 tables.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The Fluorinel and Storage (FAST) Facility delayed neutron interrogator (DNI) is a dual-assay instrument used to assay spent fuel for a criticality control check before dissolution and also to measure waste solids for material accountability before disposal. A separate shielded cubicle located below the fluorinel fuel dissolution cell houses the DNI. Two tubes penetrate the dissolution cell floor and extend down through the instrument. The smaller tube enables precision assays on waste canisters containing small amounts of uranium, and the larger tube enables measurement of fuel packages of various shapes containing large quantities of uranium. A hard-copy operations terminal located in the crane corridor above the DNI cubicle is used to operate the DNI. This location allows the operator visual access for positioning and moving samples to and from the DNI tubes. The assay system is controlled by complex software programs (initiated through simple commands) that perform diagnostics and system checks, and then the sequential operations required to properly complete measurements. This report describes the design of the control system and electronic components composing the DNI.

32768 (LA—9902-MS) Coincidence measurements of FFTF breeder fuel subassemblies. Eccleston, G.W.; Foley, J.E.; Krick, M.; Menlove, H.O.; Goris, P.; Ramalho, A. (Los Alamos National Lab., NM (USA)). Apr 1984. Contract W-7405-ENG-36. 23p. (ISPO—199). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84014132.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A prototype coincidence counter developed to assay fast breeder reactor fuel was used to measure four fast-flux test facility subassemblies at the Hanford Engineering Development Laboratory in Richland, Washington. Plutonium contents in the four subassemblies ranged between 7.4 and 9.7 kg with corresponding ^{240}Pu-effective contents between 0.9 and 1.2 kg. Large count rates were observed from the measurements, and plots of the data showed significant multiplication in the fuel. The measured data were corrected for deadtime and multiplication effects using established formulas. These corrections require accurate knowledge of the plutonium isotopics and ^{241}Am content in the fuel. Multiplication-corrected coincidence count rates agreed with the expected count rates based on spontaneous fission-neutron emission rates. These measurements indicate that breeder fuel subassemblies with ^{240}Pu-effective contents up to 1.2 kg can be nondestructively assayed using the shift-register electronics with the prototype counters. Measurements using the standard Los Alamos National Laboratory shift-register coincidence electronics unit can produce an assay value accurate to +-1% in 1000 s. The uncertainty results from counting statistics and deadtime-correction errors. 3 references, 8 figures, 8 tables.

32769 (LA-UR—84-1959) Estimation methods for special nuclear materials holdup. Pillay, K.K.S.; Picard, R.R. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 7p. (CONF-840734—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84014035.

From 25. annual meeting of the Institute of Nuclear Materials Management; Columbus, OH, USA (15 Jul 1984).

The potential value of statistical models for the estimation of residual inventories of special nuclear materials was examined using holdup data from processing facilities and through controlled experiments. Although the measurement of hidden inventories of special nuclear materials in large facilities is a challenging task, reliable estimates of these inventories can be developed through a combination of good measurements and the use of statistical models. 7 references, 5 figures.

32770 (NBL—311) Progress report for the period October 1982-September 1983. (USDOE New Brunswick Lab., Argonne, IL). May 1984. 71p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013668.

The mission activities of the New Brunswick Laboratory to provide and maintain a standards and measurements laboratory in support of the programmatic responsibilities of the Department of Energy, Office of Safeguards and Security, the regulatory functions of the Nuclear Regulatory Commission, and the international commitments of the US to assure the application of accurate and reliable measurement technology in the safeguarding of special nuclear materials are summarized.

32771 **(SAND—84-0463C) Maintenance and the upgraded security system.** Ledbetter, D.M.; Martin, J.P. (Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (USA); Sandia National Labs., Albuquerque, NM (USA)). Jul 1984. Contract AC04-76DP00789. 6p. (CONF-840734—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013059.

From 25. annual meeting of the Institute of Nuclear Materials Management; Columbus, OH, USA (15 Jul 1984).

Many facilities have installed or are planning to install upgraded security systems involving state-of-the-art electronic equipment, intrusion detection sensors, closed circuit TV systems, and active delay components with associated command and control systems. While this equipment may provide the required support for the security forces when it is installed, it can and will become a burden and yield degraded security if it is not properly maintained. This condition can exist even though it is not obvious to the operators. A program embodied in the operation of the facility is required to assure that the system continues to perform as it was designed. Recommended approaches to this problem are addressed and benefits to be gained from dedicated security maintenance teams are discusssed based on experience gained during operation of the Pantex Plant physical security system and from assisting in the implementation of upgraded systems at many DoD facilities.

32774 **(LA—9680-SR) General-Purpose Heat Source Development: safety test program. Postimpact evaluation, Design Iteration Test 1.** Schonfeld, F.W. (Los Alamos National Lab., NM (USA)). Apr 1984. Contract W-7405-ENG-36. 68p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84014173.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The General-Purpose Heat Source (GPHS) provides power for space missions by transmitting the heat of $^{238}PuO_2$ decay to thermoelectric elements. Because of the inevitable return of certain missions, the heat source must be designed and constructed to survive re-entry and Earth impact. The Design Iteration Test (DIT) series is part of an ongoing impact test program. The first DIT used a full GPHS module containing two graphite impact shells (GISs); each GIS contained two iridium (0.3 wt%) capsules filled with $^{238}PuO_2$. It was impacted at 57 m/s and 930°C. All four fuel capsules survived and none was breached. However, serious cracking of the iridium-alloy capsules was found; some cracks extended through ~ 70% of the wall thickness. Postimpact analyses of the unit are described with emphasis on weld structure and performance. 51 figures.

32775 **(LA—10075-MS) Beneficial uses of ^{241}Am.** Mangeng, C.A.; Thayer, G.R. (Los Alamos National Lab., NM (USA)). May 1984. Contract W-7405-ENG-36. 29p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013918.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report assesses the uses of ^{241}Am and the associated costs and supply. The study shows that ^{241}Am-fueled radioisotope thermoelectric generators in the range of 1 to 5 W electrical provide the most promising use of kilogram amounts of this isotope. For medical uses, where purity is essential, irradiation of ^{241}Am can produce 97% pure ^{238}Pu at $21,000/g. Using a pyro-metallurgical process, ^{241}Am could be recovered from molten salt extraction (MSE) residues at an estimated incremental cost of $83/g adjusted to reflect the disposal costs of waste products. This cost of recovery is less than the $300/g cost for disposal of the ^{241}Am contained in the MSE residues.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

A research program has been initiated to screen and select electrolyte materials for use in steam electrolyzers in the 300 to 600°C temperature range. Screening of a significant number of acid anhydrides, hydroxides, oxides, and phosphates for their electrolytic conductivity properties is underway. Of the binary materials examined to date, only polymerized phosphoric acid, immobilized on an H^+ substituted zeolite, shows promise. A substantial number of ternary compounds remain to be synthesized and evaluated.

32778 **(FRNC-TH—1512) Study of mechanism of thermolysis of steam in a cylindrical reactor between 1700-1900 K.** Abdul Aziz, G. (Rouen Univ., 76 - Mont-Saint-Aignan (France)). Feb 1982. 171p. (In French). NTIS (US Sales Only), PC A08. Order Number DE84751737.

Paper copy only, copy does not permit microfiche production.

Solar thermal energy can be used for hydrogen production from steam. In this paper is studied a reactor for thermal energy transmission to a water flow to produce a partially dissociated steam flux. For practical reasons solar energy is simulated by electric heating. Preheated steam is introduced in a high temperature oven in zirconia, pressure is maintained at 25 torrs by a pump and temperature is measured by thermocouples. The molar fraction is

determined by a mass spectrometer. Experimental results in the range 1700K to 1900K are reported and interpreted and kinetic models are deduced. High temperature should be investigated.

32779 **Immobilized chloroplast-ferredoxin-hydrogenase system for the simultaneous photoproduction of hydrogen and oxygen.** Woodward, J.; Greenbaum, E. (Oak Ridge National Lab., TN). *Biotechnology and Bioengineering Symposium;* No. 13, 271-276(1983). (CONF-830567—). Contract W-7405-ENG-26.

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

The chloroplast-ferredoxin-hydrogenase (CFH) system is capable of the simultaneous photoproduction of hydrogen and oxygen using water as the source of electrons. The immobilization of chloroplasts and hydrogenase, which has been the subject of several reports has been attempted in order to increase their storage and functional stability. However, immobilized chloroplasts and hydrogenase have never been shown to produce hydrogen and oxygen simultaneously. The simultaneous photoproduction of hydrogen and oxygen is a valuable guide in assessing the role of water as the primary substrate in biophotolysis. As has been shown previously, the stoichiometric ratio of hydrogen to oxygen is, in general, not equal to 2. By measuring the oxygen that is produced along with the hydrogen, it is possible to set an upper limit on the photoproduced hydrogen that is derive d from water. The study reported here describes for the first time the simultaneous photoproduction of hydrogen and oxygen by the CFH system immobilized in calcium alginate gel spheres. 15 references, 4 figures.

32780 **(BNL—34830) Kinetics of the absorption of hydrogen by LaNi$_5$H/sub x//n-undecane suspensions. Part I. The H$_2$/LaNi$_5$H/sub x//n-undecane system.** Reilly, J.J.; Johnson, J.R. (Brookhaven National Lab., Upton, NY (USA)). Apr 1984. Contract AC02-76CH00016. 19p. (CONF-8404106—4). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013090.

From International symposium on the properties and applications of metal hydrides; Eilat, Israel (9 Apr 1984).

Isothermal kinetic studies of the absorption of hydrogen by LaNi$_5$H/sub x/ suspended in n-undecane have been performed. The rate limiting process is the dissolution of H_2 in the solvent. A general rate equation is given, $dH_2/dt = 1/2\ ks\ (a''-a')$, where ks is the rate constant for the absorption of H_2 by the solvent; $(a''-a')$ represents a thermodynamic driving force which is determined by the equilibrium solubility of H_2 in the solvent and the equilibrium absorption plateau pressure of the solid. The rate constant is defined as k/sub s/ = A/sub s/exp(-E/sub s//RT) where E/sub s/ is the activation energy for dissolution of H_2 in the solvent and is equal to 11.0 +- 1.1 kJ/mol H_2. The pre-exponential, A/sub s/, is a function of the efficiency of the gas-liquid contact. The rate equation should have general utility and can be used with other hydrides suspended in n-undecane as long as the rate limiting process is unchanged. A new method for the study of fast reactions involving the dissolutions of H_2 in liquids is discussed. The H_2 absorption and desorption rates are well within the range required for practical applications. 10 references, 3 figures, 2 tables.

32781 **(BNL—34831) Kinetics of the absorption of hydrogen by LaNi$_5$H/sub x//n-undecane suspensions. Part II. The H$_2$/n-undecane system.** Johnson, J.R.; Reilly, J.J. (Brookhaven National Lab., Upton, NY (USA)). Apr 1984. Contract AC02-76CH00016. 16p. (CONF-8404106—5). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013091.

From International symposium on the properties and applications of metal hydrides; Eilat, Israel (9 Apr 1984).

In order to adequately treat the absorption kinetics of LaNi$_5$H/sub x//n-undecane suspensions a knowledge of the thermodynamic and kinetic behavior of the H_2/undecane system is required. The system obeys Henry's Law, P/sub H_2=N/sub H_2/K/sub H/, where N/sub H_2/ is the H_2 mol fraction. K/sub H/ varies with the temperature according to ln K/sub H/ (atm) = 455/T+5.69. The relative partial molal heat of solution, Δ anti H/sub H_2/, is 3.8 kJ (mol H_2)$^{-1}$. The absorption rate of H_2 in undecane was found to obey a first-order kinetic equation, dH_2/dt = k/sub s/$(a''-a)$, where dH_2/dt is the rate of H_2 solution, a'' is the initial amount of reactant H_2 and a is the amount of H_2 solution, a'' is the initial amount of reactant H_2 and a is the amount of H_2 solution dissolved at any time t. At a pressure of ~ 1000 kPa and between 273 to 323K, k/sub s/ = A/sub s/ exp(/sup -E/s/RT); where the activation energy, E/sub s/. is 11.1 kJ (mol H_2)$^{-1}$. A/sub s/ is dependent on the efficiency of the gas-liquid contract and thus varies with reactor design, stirring speed, etc. In our experiments, carried out in a baffled reactor at a constant stirring speed of 600 rpm, A/sub s/ = 16.1 sec^{-1} and the reaction was essentially complete in ~ 20 sec. 9 references, 4 figures, 1 table.

32782 **(DOE/CS/24310—4) Full scale field demonstration of unheated anaerobic contact stabilization.** Sykes, R.M.; Fan, K.S. (Ohio State Univ., Columbus (USA)). Sep 1983. Contract AC02-80CS24310. 345p. NTIS, PC A15/MF A01; 1; GPO Dep. Order Number DE84013546.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A full scale field demonstration of unheated anaerobic digestion, including both solids recycle and solids nonrecycle processes, was conducted at the Jackson Pike Wastewater Treatment Plant at Columbus, Ohio. Two digesters (locally called Tanks 4E and 6E) at this facility were used for this purpose. In the experimental system, the operating temperature was reduced gradually from 91°F to 63°F. There were eight periods in the Recycle Phase and four periods in the Nonrecycle Phase. Gas production, solids destruction, volatile fatty acid variation, alkalinity, and pH were monitored in each period. In addition, grease, long-chain fatty acids, and foaming were intensively investigated at the last two periods, C and D, of the Nonrecycle Phase. The objectives of this research were: (1) evaluation of the unheated anaerobic digestion in full scale field units, and (2) and development of criteria for design and operation of a cold anaerobic digester. 48 references, 41 figures, 84 tables.

32783 **(DOE/CS/40202—T11) Conversion of cellulosic wastes to liquid hydrocarbon fuels. Technical progress report, May 1-31, 1984.** Kuester, J.L. (Arizona State Univ., Tempe (USA). Dept. of Chemical Engineering). 1984. Contract AC02-76CS40202. 7p. (COO—2982-103). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013271.

Portions are illegible in microfiche products.

Progress achieved during the month of May 1984 is reported. The major efforts in this reporting period were aimed at (1) achieving sustained (>8 hrs) steady state data periods in the continuous integrated system (gasification + liquefaction) at product yields in the 40 to 60 gals/ton range; (2) determine minimum steam/carbon ratios for gasification; (3) determine pyrolysis reactor scrubber water characteristics; (4) set up new product analysis equipment; and (5) implement system improvements. The subcontractor has prepared preliminary site plans and building elevations and is proceeding with topographic surveying and obtaining geo-

technical data for the ASU designated site. Preliminary design of processing equipment is in progress. The major concern at present is the choice of compressor type compatible with eventual commercial scale (~ 300 to 1000 tons/day). The water-seal types successfully tested in the laboratory apparently are not manufactured with anywhere near the capacity required for a commercial scale facility. It is felt that any alternative type should be initially process tested on the laboratory scale. 1 figure.

32784 **(DOE/ER/12058—3) Promoter modifications of catalytic activity and selectivity. Final report, April 1, 1982-March 31, 1984.** Falconer, J.L. (Colorado Univ., Boulder (USA). Dept. of Chemical Engineering). 30 Apr 1984. Contract AC02-82ER12058. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013690.

Portions are illegible in microfiche products.

The effect of alkali promoters on the activity and selectivity for CO hydrogenation was studied on supported nickel catalysts. Temperature-programmed desorption and reaction, and steady-state reaction were used. The support was shown to have a strong influence on the changes induced by the alkali promoter. On Ni/SiO_2 and Ni/TiO_2, hydrogenation rates were significantly reduced, apparently due to weakened hydrogen bonding. This resulted in a significant increase in the olefin selectivity. On $Ni/SiO_2.Al_2O_3$, the hydrogenation rates were increased, and a maximum was observed in the rates of methane and higher paraffin formation. Little change in the Ni/Al_2O_3 catalysts was seen, except for a decrease in surface area. Temperature-programmed reaction and steady-state kinetics show good agreement for the series of catalysts. On Ni/Al_2O_3, the presence of multiple reaction sites was observed and studied in detail; a model was developed. The effect of potassium concentration on Ni/SiO_2 was large and the activity decreased rapidly even at the low concentrations. Preparation method and alkali salt used were shown to have small effects on the changes in activity and selectivity. The strong effect of the support was attributed to an interaction of the support with the promoter.

32785 (DOE/METC—84-8, pp 107-115) **Metal-support interaction studies on clean metal surfaces.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—). Contract AC21-82MC19204.

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The goal of our study is to discover which properties of the catalyst are changed by metal-support interactions and how these property changes affect the reaction rate. Special emphasis will be given to determine differences in the heats of adsorption for CO and H_2 on methanation catalysts in the presence of different support oxides since apparent changes in the adsorption isotherms have been observed. These differences in the heats of adsorption will then be correlated to the specific reaction rates to discover what fundamental changes in the adsorption properties lead to observed reactivity differences. Preliminary results show clearly that there are changes in the chemsorption properties of CO and H_2 on Pt in the presence of SiO/sub x/. 5 figures.

32786 **(DOE/PC/30022—10) Slurry Fischer-Tropsch/Mobil two stage process of converting SYNGAS to high octane gasoline. Final report.** Kuo, J.C.W. (Mobil Research and Development Corp., Paulsboro, NJ (USA)). Jun 1983. Contract AC22-80PC30022. 326p. NTIS, PC A15/MF A01; GPO Dep. Order Number DE84004411.

An evaluation study was conducted on a novel two-stage slurry Fischer-Tropsch/ZSM-5 process for converting low H_2/CO ratio synthesis gas, which can generally be obtained from highly efficient, advanced coal-gasification systems, into high quality gasoline. The feasibility of this two-stage technology was successfully demonstrated in a newly designed and constructed bench-scale unit (BSU), consisting of a slurry bubble column reactor followed by a fixed-bed ZSM-5 reactor. Three Fischer-Tropsch catalysts of $Fe/Cu/K_2CO_3$ type were evaluated. Total hydrocarbon production as high as 815 g/gFe was achieved, which is substantially better than other results reported in the literature. Methane + ethane yields ranged from 2 to 18 wt % of total hydrocarbons produced, with reactor-wax (those heavy hydrocarbons retained in the slurry reactor under reaction conditions) yields ranging from 3 to 85 wt %. Other investigations of the first-stage operation included process variable and hydrodynamic studies. The second-stage ZSM-5 reactor performed smoothly and demonstrated the conversion of Fischer-Tropsch products into high quality gasoline. The gasoline yields, including the alkylate and excluding the reactor-wax and light paraffins in the feed to the second-stage reactor, were as high as 87 wt %. The raw gasoline samples had satisfactory stability properties. A conceptual process design and scoping cost estimate for a battery-limit commercial plant to produce 27,000 BPSD gasoline from clean synthesis gas was conducted. The estimated cost is $700 million in terms of 1983 dollars at a Wyoming location.

32787 **(PB—84-178409) Methane from biomass and waste. Annual technical progress report.** Smith, W.H. (Florida Univ., Gainesville (USA). Inst. of Food and Agricultural Sciences). Jan 1983. 102p. NTIS, PC A06/MF A01.

This report summarizes the research conducted at the University of Florida on the production of methane from biomass and waste. It presents data on biomass yield studies on a wide variety of plant species which have potential to serve as a biomass source for methane production in future years. Species reported include woody, freshwater aquatics, grasses and related plants, root plants and marine plants. Over two-hundred and fifty plants have been subjected to a variety of bioassays for methane yields. Research directed toward improved conversion of biomass to methane is reported which covers the conversion spectrum from the molecular level to the cellular level to the level of conversion in unique anaerobic digesters. A comprehensive information management system has been established and systems studies have been undertaken and a preliminary model is reported.

32788 **(PB—84-179753) Microbiological and biochemical studies towards optimization of substrate utilization by methanogenic bacteria. Annual report Dec 82-Dec 83.** Ferry, J.G. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). Dec 1983. 35p. NTIS, PC A03/MF A01.

The microbiology and biochemistry of acetate conversion to methane was studied. A new acetotrophic methane-producing organism (Methanosarcina acetivorans) was isolated and characterized which showed that it is uniquely suited for biochemical and genetic studies. This organism and other acetotrophic and methylotrophic methane-producers were genetically classified by DNA-DNA and DNA-RNA homologies. This cell material was used to study the biochemical pathway of acetate metabolism to methane. Properties of the carbon monoxide dehydrogenase and methylreductase components of this system were studied in detail. This organism also contained cofactor B and a new cofactor (FAF) recently discovered in H2-oxidizing methane-producers. The results suggest that these enzymes and cofactors may be involved in the pathway. Whole cells of acetotrophic and methylotrophic methane-producing strains, examined by electron paramagnetic resonnance spectroscopy, revealed novel redox centers in the soluble and membrane fractions.

32789 **(PNL-SA—11448) Liquid fuels from biomass: an overview of research activities funded by DOE's thermochemical conversion program.** Stevens, D.J. (Pacific Northwest Lab., Richland, WA (USA)). Oct 1983. Contract AC06-76RL01830. 17p. (CONF-8310195—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013264.

From Industrial wood energy forum; Nashville, TN, USA (15 Oct 1983).

The United States Department of Energy is sponsoring research on the thermochemical conversion of biomass into useable energy forms. This research effort is divided into three technology areas including gasification, liquid fuels, and combustion. In this paper, the organization of the program and a technical overview of present liquid fuels technology research are presented.

32790 **(SERI/TP—231-2348) Fuel from microalgae lipid products.** Hill, A.M.; Feinberg, D.A. (Solar Energy Research Inst., Golden, CO (USA)). Apr 1984. Contract AC02-83CH10093. 17p. (CONF-840493—2). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84004506.

From Energy from biomass technical review meeting; Portland, OR, USA (23 Apr 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The large-scale production of microalgae is a promising method of producing a renewable feedstock for a wide variety of fuel products currently refined from crude petroleum. These microalgae-derived products include lipid extraction products (triglycerides, fatty acids, and hydrocarbons) and catalytic conversion products (paraffins and olefins). Microalgal biomass productivity and lipid composition of current experimental systems are estimated at 66.0 metric tons per hectare year and 30% lipid content. Similar yields in a large-scale facility indicate that production costs are approximately six times higher than the average domestic price for crude, well-head petroleum. Based on achievable targets for productivity and production costs, the potential for microalgae as a fuel feedstock is presented in context with selected process refining routes and is compared with conventional and alternative feedstocks (e.g., oilseeds) with which microalgae must compete. 24 references, 9 figures, 4 tables.

32791 **Alternative fuels for general aviation. Hearing before the Subcommittee on Transportation, Aviation, and Materials, U.S. House of Representatives, Ninety-Eighth Congress, First Session, August 29, 1983.** Washington, DC; Government Printing Office (1983). 213p.

Five witnesses representing general aviation and aviation fuel industries and the Federal Aviation Administration testified on the potential for using alternative fuels in general aviation to counteract the effects of high prices and supply vulnerability on the industry. The witnesses described test results of liquid methane and alcohol fuels, noting that those fuels which most closely emulate the properties of petroleum will best serve the industry's needs. Their testimony covered environmental and economic effects as well as fuel performance. The Synthetic Fuels Corporation, DOE, National Aeronautics and Space Administration, and the Department of Defense, as well as the aviation industry have research programs on aviation fuels.

32792 **Composition of gas produced by large scale anaerobic digestion of municipal solid waste.** Narasimhan, R.; Gerrish, H.P.; Sengupta, S.; Daly, E.L. Jr.; Nemerow, N.; Wong, K.V.; Voorhees, S.A. (Univ. of Miami, Coral Gables, FL). pp 171-176 of Resource recovery from solid wastes. Sengupta, S.; Wong, K.F.V. (eds.). Elmsford, NY; Pergamon Press Inc. (1982). (DOE/EV/10671—1; CONF-820565—). Contract AS05-78EV10133.TI83005317

From Conference on resource recovery from solid wastes; Miami Beach, FL, USA (10 May 1982).

This paper gives the composition of gas produced by the large-scale anaerobic digestion of municipal solid waste in the mesophilic and thermophilic temperature range. It is found that the composition of methane is higher in the thermophilic range when the retention time is 20 days or more. Our data did not agree with the relationship between the composition of gas versus temperature, pH and alkalinity as found in literature. 6 references, 1 figure, 3 tables.

32793 **Surface electronic properties and CO hydrogenation activity of nickel deposited on rutile TiO_2(100) as a model supported catalyst.** Kao, C.C.; Tsai, S.C.; Chung, Y.W. (Northwestern Univ., Evanston, IL). *Journal of Catalysis;* **73**: 136-146(1982). Contract AC02-78ER04946.

A combined ultrahigh-vacuum surface analysis-high-pressure cell system has been used to study the electronic properties and CO hydrogenation behavior of nickel deposited on single-crystal rutile TiO_2(100) as a model supported catalyst. Photoemission studies show that nickel atoms at the Ni/TiO_2(100) interface are negatively charged. In situ CO hydrogenation studies at a total pressure of 80 Torr have been performed on Ni/TiO_2(100) and Ni(111) from 170 to 270°C. The methane turnover number of Ni/TiO_2(100) is a function of the Ni coverage and attains a maximum at an average Ni thickness of 5 A. The methanation activity of 5A Ni/TiO_2 is a factor 3.3-3.7 times that of Ni(111), with an accompanying shift of the product distribution toward higher hydrocarbons. 44 references, 11 figures.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This extremely significant 10th quarter was highlighted by the successful shakedown operation of the LaPorte PDU. Obstacles to start-up, which included exotherms in the unit and the presence of carbonyls, were eliminated. For the successful 10-day PDU shakedown operation, 900 lb of EPJ-19LR catalyst were used. Methanol was produced from both balanced and CO-rich synthesis gas at various operating conditions, and ranged from 1.8 to 8.5 tpd. The highest catalyst productivity achieved during the run was 1.75 lb of methanol/lb catalyst-h, which is significantly higher than can be achieved in gas phase synthesis. Catalyst attrition was significant; the catalyst extrudates in the ebullated-bed reactor rapidly attrited. The catalyst formed an 18 wt % slurry by the end of the run. However, during the transition from ebullated to slurry catalyst, the PDU and catalyst performed very well, and catalyst activity remained high. Support work at CSI continued with autoclave testing of a new catalyst candidate for liquid-entrained operations, and with other miscellaneous tests for hydrodynamic characterization of catalyst powders. At APCI, a 250-h test using an ICI catalyst on balanced gas at a 37 wt % loading was successfully completed in the 300-cc autoclave. The results are very encouraging with respect to maximizing productivity on a reactor volume basis. To complete the data base on catalyst aging, a gas phase activity maintenance run was successfully conducted. The results suggest that CO may be important in catalyst deactivation for gas phase methanol synthesis. 6 references, 32 figures, 28 tables.

32795 **(HNEI—80-03) Hawaii Ethanol from Molasses Project, Phase I. Final report.** Chen, C.S,; Gibson, W.O.; Mashima, K.I.; Roberts, R.R.; Rezachek, D.A.; Krill, K.; Hsu, D.; Stanley, R.W. (Hawaii Univ., Manoa (USA). Hawaii Natural Energy Inst.). Apr 1980. Contract AC03-79ET23141. 197p. NTIS, PC A09/MF A01; 1; GPO Dep. Order Number DE84014845.

Portions are illegible in microfiche products.

The purpose of this study was (1) to determine the best available commercial processes in the manufacture of anhydrous ethanol from molasses, (2) to determine those processes in the research and development stage that have the potential of becoming commercial, and (3) from these determinations to recommend the conceptual design of a plant which incorporates the best processes. The following ethanol production processes have been firmly selected as being the best available: (1) co-generation of steam and electricity, (2) molasses acidity adjustment, dilution, sterilization, centrifugation, and nutrient addition; (3) continuous fermentation; (4) yeast recycling and drum-drying excess yeast; (5) pressure differential distillation; and (6) dehydration with cyclohexane or ether. A number of environmentally acceptable alternative processes for handling stillage were evaluated, and the following recommendations were made: (1) recycling 20% ds stillage should be practiced; (2) producing an animal feed directly from the stillage is the preferred process for handling stillage providing the amount produced and its value are confirmed by pilot-plant production and animal feeding trials; (3) should the above pilot-plant production and animal feeding trials prove negative, stillage incineration with potassium recovery is the preferred option; (4) deep ocean discharge of stillage should be considered only as a temporary option; and (5) producing methane is not a viable option. It was suggested that in Hawaii, with its temperate climate, it may be feasible to use a fuel consisting of gasoline and 96% ethanol instead of anhydrous ethanol (99.6%). The effects on energy requirements and costs of producing 96% ethanol were determined and compared to those ef-

fects from the production of anhydrous ethanol. 13 references, 26 figures, 23 tables.

32796 **(NP—4770269) Homogenous high pressure hydrogenation of carbon monoxide using cobalt, ruthenium and iridium catalyst.** Anstock, M. (Technische Hochschule Aachen (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). 30 Nov 1982. 182p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE84770269.

Portions are illegible in microfiche products.

Within the framework of this dissertation an attempt was made to convert synthesis gas to low molecular oxygen containing compounds using homogeneous catalysts. Depending on the conditions of reaction major products obtained were formic acid methyl ester, methanol, ethanol, or ethylene glycol, and by-products formed were formic acid ethyl ester, acetic acid methyl ester, n-propanol, ethylene glycol formiate, 1,2-propandiol and glycerol. Cobalt, iridium and ruthenium compounds were used as catalysts in this synthesis where pressures of 2000 bar are required. A comparison of the catalyst metals cobalt, ruthenium and iridium revealed the highest activity with ruthenium compounds. The cobalt-based system, on the other hand, led the highest yields of ethylene glycol.

32797 **(PNL-SA—12259) Progress in studies on catalyzed gasification of biomass.** Baker, E.G.; Mudge, L.K.; Brown, M.D. (Pacific Northwest Lab., Richland, WA (USA)). May 1984. Contract AC06-76RL01830. 27p. (CONF-8405157—2). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013259.

From 16. biomass thermochemical conversion contractors meeting; Portland, OR, USA (8 May 1984).

Portions are illegible in microfiche products.

The Pacific Northwest Laboratory (PNL) is conducting an ongoing project, sponsored by the Biomass Energy Technology Division of the U.S. Department of Energy, on the gasification of biomass in the presence of catalysts. The purpose of the project is to evaluate the technical and economic feasibility of producing specific gas products throught the catalytic gasification of biomass. This report presents the results of research conducted since the 15th Biomass Thermoconversion Contractors's Meeting and current project status. Laboratory studies have determined the mechanism of carbon deposition on secondary catalysts. Types of catalysts that minimize carbon deposition have been identified. These studies have also provided a fundamental understanding of the effects of both primary and secondary catalysts. This included a review of the state of the art of catalysis as it applies to biomass gasification. The process development unit (PDU) was successfully operated using bagasse from Australia as a feedstock. Both primary and secondary catalysts were used. The economics of producing methanol from bagasse were evaluated and the economics of a wood-to-methanol plant were updated from 1980 to 1983. A bench-scale gasification system (1 to 3 kg/h) is being built to provide the capabilities of the PDU gasifier system at a lower cost. The primary goal of the bench-scale studies to to demonstrate that carbon deposition on catalysts and catalyst attrition can be controlled at acceptable rates in a fluidized bed. 32 references, 3 figures, 8 tables.

32798 **Fifth symposium on biotechnology for fuels and chemicals.** Scott, C.D. (ed.). New York, NY; John Wiley and Sons, Inc. (1984). 672p. (CONF-830567—). John Wiley and Sons, Inc., 605 Third Avenue, New York, NY 10158.

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

The five main topics dealt with in this conference were: thermal and chemical processing of biomass (acid hydrolysis, enzyme hydrolysis, catalytic cracking); bioconversion research (culture of bacteria, control of fermentation processes, use of cocultures and immobilized cells for biomass conversion); bioprocess research and development (ethanol fermentation, methane production, enzyme stability); bioprocess engineering (genetic engineering, economic analyses, lignin potential, algae harvesting); and separation processes for ethanol and other chemicals. Most of the 53 papers have been abstracted separately. 904 references, 291 figures, 185 tables.

32799 **Production of ethanol from biopolymers by anaerobic, thermophilic, and extreme thermophilic bacteria. I. Regulation of carbohydrate utilization in mutants of Thermoanaerobacter ethanolicus.** Carreira, L.H.; Wiegel, J.; Ljungdahl, L.G. (Univ. of Georgia, Athens). *Biotechnology and Bioengineering Symposium;* No. 13, 183-191(1983). (CONF-830567—). Contract AS09-79ER10499.

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

One mutant of T. ethanolicus JW200 Fe(4) was characterized by studying fermentations of xylose, glucose, cellobiose, and soluble corn starch and mixtures of two or three of these substrates. JW200 Fe(4) does not show diauxic growth characteristics if xylose and hexose are supplied together. However, in mixtures, glucose is used prior to the breakdown of cellobiose or starch. 13 references, 5 figures.

32800 **Production of ethanol from biopolymers by anaerobic, thermophilic, and extreme thermophilic bacteria. III. Thermoanaerobacter ethanolicus JW200 and its mutants in batch cultures and resting cell experiments.** Wiegel, J.; Carreira, L.H.; Mothershed, C.P.; Puls, J. (Univ. of Georgia, Athens). *Biotechnology and Bioengineering Symposium;* No. 13, 193-205(1983). (CONF-830567—). Contract AS09-79ER10499.

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

Several thermophilic and extreme thermophilic anaerobic bacteria can utilize hemicellulose (xylan polymer) from birch- and beechwood directly. Thermoanaerobacter ethanolicus JW200 exhibited the highest ethanol formation, although the extracellular xylanase and xylosidase activities were very low. All bacteria rapidly utilized xylose before the polymers were utilized at a lower rate. With resting cell suspensions of T. ethanolicus and its mutants, the ethanol formation rates were as high as 60 mmol (2.76 g) and 30 mmol (1.3 g) ethanol per liter per hour from glucose and xylose, respectively. After 1 hour the ethanol productions in the concentrated cell suspensions were linear for over 10 hours from glucose or xylose; however, with soluble starch (DE 10) the rates were increasing with time. From these experiments it is concluded that the contiuous culture experiments with hemicellulosic material and/or starch have to be performed with recycling of the cells and the extracellular enzymes. 25 references, 6 figures, 3 tables.

32801 **Product inhibition of Zymomonas mobilis: evidence for two inhibitors.** Worden, R.M.; Donaldson, T.L.; Shumate, S.E. (Oak Ridge National Lab., TN). *Biotechnology and Bioengineering Symposium;* No. 13, 265-269(1983). (CONF-830567—). Contract W-7405-ENG-26.

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

Batch-growth experiments were conducted in New Brunswick model C-30 fermenters having a 350-ml working volume. Temperature and pH values of 36°C and 6.0, respectively, were maintained using automatic controllers and a 2M KOH titrant. The growth medium contained 10% (w/v) glucose, 0.5% yeast extract (Difco), 0.1% KH_2PO_4, 0.05% $MgSO_4 \times 7H_2O$, 0.1% $(NH_4)_2SO_4$, and 0.01M succinate. These culture conditions were found in a previous study to provide maximal initial growth and ethanol production rates for Z. mobilis (ATCC 10988). Growth medium was prepared and autoclaved (121°C for 25 min) with the sugar separate from the remaining solutes to prevent darkening of the solution. After autoclaving, all components were combined, and the medium was allowed to cool under a nitrogen atmosphere to maintain anaerobic conditions. The medium was then spiked with the desired amount of 95% ethanol just prior to inoculation with Z. mobilis. The reactors were then sampled periodically to monitor biomass and ethanol concentrations. 8 references, 2 figures, 1 table.

32802 **Ethanol production in a fluidized-bed bioreactor utilizing flocculating Zymomonas mobilis with biomass recycle.** Scott, C.D. (Oak Ridge National Lab., TN). *Biotechnology and Bioengineering Symposium;* No. 13, 287-298(1983). (CONF-830567—). Contract W-7405-ENG-26.

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

Bench-scale, fluidized-bed bioreactor systems are being used to convert glucose to ethanol by particles of a flocculating strain of Zymomonas mobilis; ethanol production rates in excess of 600 g/l-h have been achieved. The systems have been operated successfully for extended periods (500 h) while using unsterilized feed with glucose concentrations in the range 100 to 160 g/l. The primary bioreactor was also operated in the absence of necessary nutrients but coupled to a small secondary reactor in which the biomass particles were recycled and exposed to small amounts of the nutrients. 11 references, 6 figures, 3 tables.

32803 **Thermochemical conversion of biomass to ethanol.** Jenkins, D.M.; Huffman, W.J.; Allen, B.R. (Battelle Memorial Inst., Columbus, OH). *Biotechnology and Bioengineering Symposium;* No. 13, 557-566(1983). (CONF-830567—).

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

Thermochemical conversion of biomass to ethanol should be considered as an alternative to the conventional fermentation technologies. The thermochemical conversion of biomass consists of three steps: the hydrolysis of holocellulose to five and six carbon sugars, the conversion of sugars to lactate salts, and the pyrolysis of lactate to ethanol. Major coproducts of the process are acetic acid, butanediol, and an oxygenated hydrocarbon which has not been completely identified. A preliminary economic evaluation indicates that the overall process has economically attractive features. 4 references, 5 figures, 4 tables.

32804 **Small-scale continuous distillation.** Eley, M.H.; Schroer, B.J.; Adcock, L.E. II. (Univ. of Alabama, Huntsville). *Biotechnology and Bioengineering Symposium;* No. 13, 663-668(1983). (CONF-830567—).

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

Studies on commercially available batch distillation units had shown these units to have very high capital cost, poor performance characteristics, and a negative energy balance. Although several well-known pioneers in continuous farm-scale ethanol production have been successful, basic information on the design, fabrication, costs, and operation of such facilities has not been widely disclosed to the agricultural community. The first objective of this study was to design a small-scale continuous distillation unit capable of producing 10-15 gal/h of 170-190 proof ethanol. Additional design parameters were to utilize readily available materials, to minimize costs, to incorporate features that would permit easy replication, and to require only modest skills for fabrication. The second objective was to economically fabricate the unit. Fabrication skills were limited to modest welding and plumbing with a minimum of manhours of labor. The third objective was to thoroughly evaluate the unit with emphasis on production potential, operational considerations, and energy balance. The fourth objective was to compare the unit with a perforated plate and a packed rectifying column.

32805 **(ANL/CNSV-TM—134-Vol.2) Study of existing RDF-cofiring experience. Volume 2. Appendixes to Phase I final report.** Fiscus, D.E.; Ege, H.D.; Petersen, R.D.; Glaub, J.C.; Joensen, A.W.; Wolfs, K.E.; Savage, G.M. (Midwest Research Inst., Kansas City, MO (USA)). Oct 1983. Contract W-31-109-ENG-38. 397p. NTIS, PC A17/MF A01; 1; GPO Dep. Order Number DE84013104.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The purpose of Phase I is to collect and assemble all relevant data from the experience of cofiring refuse derived fuel (RDF) in electric utility suspension fired and cyclone fired boilers. This was accomplished through both questionnaires and site surveys. Appendix A contains case study reports while Appendices B and C contain test data obtained from the questionnaires for power plants and RDF processing plants respectively. 68 figures, 128 tables.

32806 **(VTT-TIED—197) Flame control of the fire-grate by digital technigues. Preliminary study.** Haapanen, P.; Lilja, R.; Ollus, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Mar 1983. 33p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland. Order Number TI84751039.

Television cameras for controlling the burning in fire-grate furnaces using wood wastes are discussed. The report is a preliminary report of the research concerning digital technique applications for controlling the fire-grate furnaces. Various kinds of fire-grates and their adjusting principles are presented.

REFER ALSO TO CITATION(S) 32812, 32819

32808 (CONF-8110328—, pp 137-148) **Z'Mutt compensating basin and sediments.** Bezinge, A.; Bonvin, G. 1981. (In French). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The Z'Mutt compensating basin with a volume of 850'000 m^3, receives decanted glacial waters as well as rinsing waters from sand removers. Afterwards, these waters are pumped up in the main free flow tunnel and conducted into the Grande Dixence storage. This study exposes two important problems: - the deposit mechanism of 20-35'000 m^3 sands and muds in the basin and their evacuation each autumn, - the decantation mechanism and the transport of solid materials throughout the basin. The influence of floating particles on the wear of centrifugal pumps with a description of the means allowing to extend the time between maintenance works.

32809 **(DOE/ID/12201—T2) Field test of ultra-low head hydropower package based on marine thrusters. Final report.** (Energy Research and Applications, Inc., Santa Monica, CA (USA)). Dec 1983. Contract FC07-80ID12201. 49p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013685.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The project includes the design, fabrication, assembly, installation, and field test of the first full-scale operating hydropower package (turbine, transmission, and generator) based on a design which incorporates a marine-thruster as the hydraulic prime mover. Included here are: the project overview; engineering design; ultra-low head hydropower package fabrication; component procurement, cost control, and scheduling; thruster hydraulic section installation; site modeling and resulting recommended modifications; testing; and baseline environmental conditions at Stone Drop. (MHR)

1305 Economics And Management

32810 (CONF-8110328—, pp 241-247) **Repair of the Palagnedra spillway after the flood of 1978.** Trucco, G. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

During the exceptional flood of August 7, 1978, the Palagnedra dam, belonging to the Maggia Power Plant Company was overtopped and its diaphragm wall on the right bank suffered severe damage. Moreover the flood carried also 25'000 m^3 of wooden debris and logs, and approx. 1.8 mio m^3 of alluvial material into the basin. The present report describes the repair of the damages and the remodeling of the spillway to avoid similar flushing of the basin to restore its original capacity.

32811 **(PB—84-157015) Small hydro-electric potential west Poverty Bay region. Final report.** (New Zealand Energy Research and Development Committee, Auckland). Jul 1981. 70p. (R—66). NTIS, PC E04/MF E01.

This study has identified six schemes in the Bay of Plenty Electric Power Board area and two in the Poverty Bay Electric Power Board area, of which five and one respectively are below the economic limit of $2400/kW suggested by the Ministry of Works and Development as of December 1979. Of these, only three appear both economic and environmentally acceptable.

1306 Environmental Aspects

32812 (CONF-8110328—, pp 9-25) **Silting of storage areas in rivers and lakes.** Vischer, D. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

An introduction into problems of sedimentation in water reservoirs (rivers and lakes) in general and in Switzerland is presented from the view of hydroelectric power development. The major part of sediments in water reservoirs consists in silt. Reasons of sedimentation and some adequate means are shown to slow down or even prevent the process of sitting up: filtering silt of inflows to the reservoir, preventing erosion (e.g. by foresting), constructing, compensation basins, dredging and scouring of sediments.

32813 (CONF-8110328—, pp 27-40) **Storage loss.** Graf, W.H. 1981. NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Empirical methods to determine loss of storage in water reservoirs by calculation and measuring are reviewed: 1) Trap efficiency of a reservoir (i.e. its ability to trap and/or to retain the entering sediments). It depends on particle size, reservoir size, inflow ratio and others. 2) Distribution of sediments, depending on reservoir site, depth, zero elevation, sediment type and others. 3) Reservoir sedimentation surveys practiced by sonic equipment, terrestrial surveying or aerial photogrammetric equipment. 4) Measuring and control methods for reservoir sedimentation such as control of watershed, control of inflow, of sedimentation and removal of sediments.

32814 (CONF-8110328—, pp 41-48) **Origin of fine-grained sediment in reservoirs as a function of the geological situation in the source areas.** Ammann, M. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Investigations of fine-grained sediments from four Swiss reservoirs are compared with samples collected from affluents. It is shown that the quantity of fine-grained sediment is strongly dependent on the geological situation in the source areas. By means of two water reservoirs the results of the sediment samples are shortly described (Lake Siehl and Bacino di Val Malvaglia).

32815 (CONF-8110328—, pp 49-56) **Simulation model for calculating sedimentation in water reservoirs.** Plate, E.J.; Ihringner, J.; Treiber, B. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The calculation of the reservoir deposition with the application of mathematical simulation models for the optimization of reservoirs is of great importance. The sedimentation of the wash load in a reservoir will be demonstrated by means of simplified reservoir geometry, and thus the current change in time of the reservoir bed will be determined.

32816 (CONF-8110328—, pp 57-65) **Time-dependent degradation of sediment accumulation during the scouring of storage basins.** Schoeberl, F. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Concerning the time-dependent degradation of sediment accumulations a modified formula is presented, based on the results of W. Willi's experiments and directly considering the influence of the involved sediment material. Futhermore some equations are given for the time-exponential reduction of erosion activity and of selfstabilisation by armoring at the end of the erosion process.

32817 (CONF-8110328—, pp 67-72) **Echo-depth sounding and evaluation in order to detect and record sedimentation in water-reservoirs.** Straub, T.C. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Suitable measurement techniques and procedures for surveying of sediment deposits in reservoirs, applying echo-sounding equipment will be described.

32818 (CONF-8110328—, pp 73-80) **Hydro power station Eglisau - periodical survey of the sedimentation 1919-1980.** Pfeiffer, C. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The methods to measure river profiles to determine the alteration of the riverbed are shown at the example of the Rhineriver power station Eglisau. This plant belongs to the North-East-Swisse power company (NOK).

32819 (CONF-8110328—, pp 81-88) **Silting and removing problems in the storage zone of the hydraulic power plant Eglisau.** Morf, J. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The effluents deposit big quantities of sedimentary materials in the uppermost part of the storage zone of the Hydraulic Power Plant Eglisau (Owner and Operator is Nordostschweiz. Kraftwerke AG, Baden. Construction period 1915-1920). These deposits raise the ground water level and menace to wet the adjacent cultivated land. It is necessary to remove the deposited sediments periodically 760'000 m^3 of material were removed out of the Rhine river bed in three dredging campaigns.

32820 (CONF-8110328—, pp 89-97) **Silting-up of the Klingnau storage-lake from 1935 until today.** Baechli, L. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The silting-up of the Klingnau storage-lake, beginning immediately after impounding in 1935, caused a reduction of the storage volume from initially 7 Mio m^3 to 3 Mio m^3. The lake bottom has been well sealed by the deposition of soil. A complete sealing effect for the lake embankments did not, however, result from the depositions. The state of aggradation has slowly stabilized to become permanent and shows clearly that the river Aare is forming again its original course but at a higher level. The degree of inundation possible for the silted-up areas will, however, still be limited by the embankments.

32821 (CONF-8110328—, pp 99-106) **Sedimentation in the Bremgarten-Zufikon-reservoir on the Reuss river.** Jaeggi, M.; Lambert, A.; Smart, G. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Sedimentation processes in the reservoir and in the lacustrine realm of Unterlunkhofen are investigated by field measurements and numerical simulation. This procedure provides an approximation of the silting-up progress.

32822 (CONF-8110328—, pp 115-127) **Silting-up of the reservoirs of hydroelectric generating stations on the Swabian-Bavarian rivers Iller, Guenz, Wertach and Lech.** Schiechtl, H.; Rapp, R.; Hillenbrand, G. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The electricity supply bodies LEW, BEW and BAWAG operate at the above mentioned rivers a total of 32 hydroelectrical generating stations with river reservoirs. After some introductory remarks on geographics, geological and hydrological features and on the development and extension of these rivers, as well as the quotation of data relating to the economics of energy supply, the silting-up of the reservoirs is dealt with. The report should be treated as a collection of material; details are explained with reference to some examples.

32823 (CONF-8110328—, pp 129-135) **Silt measurement and monitoring on Rhine canal sections between Basle and Strasbourg.** Soyer, G. 1981. (In French). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The author describes EDF methods for monitoring the development of silt deposits on Rhine canal sections between Basle and Strasburg as well as removel technics designed to insure uninterrupted flow of flood-waters and maintenance of normal cross-section of the international navigable channel.

32824 (CONF-8110328—, pp 149-155) **Problems of siltation in three compensating basins at Linth-Limmern power scheme.** Baechtiger, O. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The deposits in the basins consist of mud and fine sand. The floor slope of the basins is too small to permit flushing of the deposits. Since appropriate storage areas are not available a procedure with restitution to the river had to be developed. After initial difficulties good results were achieved by a combination of mechanical scratching and well dosed flushing.

32825 (CONF-8110328—, pp 157-163) **Silting-up and scouring of the small Innerferrera reservoir of the Hinterrhein Hydroelectric Scheme.** Willi, W. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

During the 20 year long operation, it was possible to scour and drag 31% of the deposits of solid material out of the reservoir. About 90% of the total sediment load passed through the reservoir without settling. Today the settled materials cause a reduction in storage volume of 37%. The observations made during scouring operations are compared with the results of the model tests and with relationships derived theoretically. Good agreement is obtained.

32826 (CONF-8110328—, pp 165-174) **Model tests for flushing of bed load sediment from the upper end of the compensating reservoir Rempen of AG Kraftwerke Waegital.** Huber, A. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Flushings are performed through a by-pass tunnel. The total weight of flushed material was measured continuously by a sediment balance. The results give a relation between flushed bed load, water discharge and flushing time.

32827 (CONF-8110328—, pp 175-182) **Fine material deposit and flushing of the surge pond of Mattsand.** Fux, C. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The quantity of solid materials carried down the Mattervispa river is very considerable. Due to this high solids contents, several 10,000 m^3 of fine material are annually deposed in the 210,000 m^3 Mattsand surge pond. The grain size of the deposed material is less than 0.2 mm. Various methods for cleaning out the pond have been tried. The results of experience, numerous tests and observations have led to a annual flushing of the pond.

32828 (CONF-8110328—, pp 183-196) **Sedimentation and erosion in the reservoir of Ferden.** Volkart, P. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The mechanism of sedimentation and erosion in the reservoir of Ferden had been investigated in a 1:50 hydraulical model. The grain size distribution and the beginning of sediment transport had been determined in situ before. The annual bed load yield had been estimated before the tests. During the first 5 years of operation the sedimentation process in the prototype was documented with photographs. Good agreement was found with the model test results which is also due to the extensive field investigations before the tests.

32829 (CONF-8110328—, pp 197-205) **Flushing of sediments at the Gebidem-Dam.** Giezendanner, W.; Dawans, P. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The flushing of sediments at the Gebidem-Dam occurs in a satisfactory way since 13 years. The results of the hydraulic model tests are confirmed. Just the volume of water necessary for the purges proves to be less than expected. The owner of the scheme has since improved the operation procedure and found the optimum conditions for flushing.

32830 (CONF-8110328—, pp 207-214) **Sedimentation in the Grimsel reservoir.** Rueegsegger, P. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The paper discusses the sedimentation problems in the Grimsel Reservoir. Model tests and the measures taken to keep sedimentation under control are reported.

32831 (CONF-8110328—, pp 215-222) **Silting-up in the Etzelwerk.** Ziegler, A. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

This contribution on the Sihlsee-reservoir summarizes its management, its catchment area behavior and the possibilities of sediment input reduction by selected river control works. A recent bathymetric survey has revealed areas of silting-up and erosion. However it would be interesting to investigate if this "erosion" could be the result of sedimentary compaction effects.

32832 (CONF-8110328—, pp 223-232) **Experience with a sediment trap on the Emme river upstream of the weir at Flumenthal.** Markwalder, R.; Chervet, A. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Since 1969 a sediment trap has been working on the Emme river just upstream of its confluence with the Aare river. Its purpose is to catch the bed load transported by floods in the Emme river. The volume of the trap is about 40,000 m^3. Model tests were made to check the dimensions and function of the sediment trap. Experience with the prototype showed that the trap is functioning satisfactory. About 17'000 m^3 of sediment has been trapped per year.

32833 (CONF-8110328—, pp 233-239) **Flood disaster 1978 in the compensation basin of Palagnedra.** Martini, O. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

From the beginning, a considerable sedimentation had been ascertained in the compensation basin of Palagnedra. Pumping at first and the construction of a discharge tunnel then, was the guarantee for the operation of the power plant, until the flood of 78 took place, damaging the whole plant (basin - dam - under pressure system - power plant). The restoration works caused a 10 months out of operation of the power plant.

32834 (CONF-8110328—, pp 249-256) **Experience with clearance of storage areas at the Tauernkraftwerke AG plants in Salzburg.** Hofer, F. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

After the demonstration of the storage power stations run by the Tauernkraftwerke, the methods of the removal of geolocial deposit are exposed. The utilization of natural depository basins is alluded to. Economically expensive clearing attempts by suction dredges are also mentioned and details about a successful modification of a ground outlet are given.

32835 (CONF-8110328—, pp 257-270) **Scouring of sediments in small and medium scaled water reservoirs.** Krumdieck, A.; Chamot, P. 1981. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The useful volume of relatively small reservoirs can be maintained at all times provided that the operation of the reservoir allows to flush it periodically with a free flow condition. The requirements for the success of such sediment flushings are an appropriate topographical configuration and an adequate design of the bottom outlet. The cleaning of reservoirs by means of flushing under free flow conditions is the most effective and economical solution. Criteria are given how to design a bottom outlet in order to get a perfect flushing even under extreme conditions. An example illustrates the method of such flushings successfully feasible without affecting the economy of the reservoir.

32836 (CONF-8110328—, pp 271-278) **Dam of Ksob (Algeria).** Stucky, J.P. 1981. (In French). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Design of a sediment by-pass. The Ksob dam was heightened in 1977 in order to increase its storage capacity. A sediment derivation tunnel by-passing the reservoir was designed for a second stage. It will be operated during floods and is expected to delay significantly important storage losses due to reservoir sedimentation.

32837 (CONF-8110328—, pp 279-288) **Intake elevation of the bottom discharge of the Grande Dixence dam.** Bezinge, A.; Aeschlimann, R. 1981. (In French). NTIS (US Sales Only), PC A13/MF A01. Order Number TI84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

The bottom discharge is a security organ for the maintenance and the exploitation of the dam all the more that this latter is not equipped with an overflow. Because of the accumulation of excavated materials from the dam foundations and a large transport of mud which had settled at the bottom of the dam, the level of the initial water intake has be come to low. The study describes the elevation work of the intake, carried out in 12 days only. We hope that this correction allows an operation of the storage without any difficulties in the next 40 to 50 years.

32838 **(CONF-8110328—) Silting of storage areas and reservoirs in the Alpine region.** (Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaciologie). 1981. 285p. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number DE84770265.

From International experts' meeting on silting of storage areas and reservoirs in the Alpine region; Zurich, Switzerland (22 Oct 1981).

Portions are illegible in microfiche products.

Separate abstracts were prepared for individual papers.

32839 **(PB—84-178003) CO_2 (carbon dioxide) fire protection study for hydrogenerators: report of findings.** Chadwick, R.W.; Klataske, L.F.; Osburn, G.D. (Bureau of Reclamation, Denver, CO (USA). Engineering and Research Center). Feb 1984. 30p. NTIS, PC A03/MF A01.

Large generating and pump-generating units are protected by automatic CO_2 fire-protection systems. A review is made of the power industry control philosophy for CO_2 discharge. Guidelines are given on ionization detectors, manual-electrical CO_2 discharge, manual-mechanical CO_2 discharge, electrical CO_2 discharge control circuit, safety, and reliable operation.

32840 **(DOE/ID/12201—T3) Application of marine thrusters as ultra-low head hydroturbines.** (Energy Research and Applications, Inc., El Segundo, CA (USA)). Jan 1984. Contract FC07-80ID12201. 77p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013096.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The results of the first field test of an ultra-low head hydropower unit based on a marine thruster are presented. Testing was initiated in December 1982 and resumed in April 1983, coincident with the irrigation season. Use of a modified marine thruster as a hydroturbine was successfully demonstrated, though power output was lower than calculated as further explained in this test report. Installation and test was at Stone Drop on the MID Main Canal. Flow during test was 500 to 540 cfs at 16 ft of head. Maximum scheduled canal flow is 1100 cfs. Flow is available throughout the District's eight month irrigation season. In the as built final site configuration, the thruster was operating at 13 ft of effective head and 386 cfs flow. Power output is 235 kW under these conditions. At this installed capacity, typical annual generation is 1,353,600 KWHRS with actual energy output dependent on the irrigation period.

32841 (DOE/CS/60014—2) Planning and zoning for solar access. A guide for Minnesota communities. (Minnesota Dept. of Energy and Economic Development, St. Paul (USA). Energy Div.). Sep 1983. Contract FG45-76CS60014. 87p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84012695.

The purpose of this guide is to provide information on solar energy systems, solar access issues and protection techniques to enable planners, zoning administrators, and local elected officials to: Remove barriers to the use of solar energy in zoning ordinances and subdivision regulations; facilitate the access of solar systems in new and existing developments to sunlight by changes in zoning ordinances and subdivision regulations; and implement techniques to guarantee solar access.

32842 (LBL—17649) Solar irradiance: the effect of dimensionality on solar spectrum curves. Casti, T.E.; Otvos, J.W. (Lawrence Berkeley Lab., CA (USA)). Apr 1984. Contract AC03-76SF00098. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84014136.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The shape of the solar irradiance curve and the location of its maximum are dependent upon the units chosen for expressing irradiance and therefore upon the experimental method of making the measurements. Some of the confusion resulting from this fact could be eliminated if relative bandwidth were used instead of the more conventional wavelength bandwidth or wavenumber bandwidth. Formulae are given and curves are shown for expressing solar irradiance (6000°K black body) in all three ways and with respect to both power and photon rate.

32843 (PB—84-152305) Availability of NBS (National Bureau of Standards) radiometric standards for solar irradiance studies. Final report. Madden, R.P. (National Bureau of Standards, Washington, DC (USA)). 1980. 8p. Pub. in Proceedings of Workshop Solar UV Irradiance Monitors, Boulder, CO., 31 Jul-1 Aug 80, p79-86.

The development of primary and secondary radiometric standards at the National Bureau of Standards is a responsibility of the Center for Radiation Research, in the National Measurement Laboratory. Three different standards available from NBS are given.

32844 (AD-A—138938/6) Low-cost GaAs solar cell development. Final report Sep 81-Sep 83. Ludowise, M.J. (Varian Associates, Palo Alto, CA (USA). Solid State Lab.). Dec 1983. 71p. NTIS, PC A04/MF A01.

An abbreviated program to design and develop a thin, low-cost GaAs solar cell for space applications is described. Due to funding limitations, the scheduled four-year program was terminated at the two-year point. Several growth runs utilizing the metal organic-chemical vapor phase (MO-CVD) epitaxial process were made in an attempt to optimize the solar cell structure. Both p/n and n/p growths were made with varying emitter thickness and doping levels. Cell thinning for selected cells was successful to less than 10 microns using a special stop-etch technique. These cells were covered prior to thinning to provide strength and reduce the probability of breakage.

32845 (BMFT-FB-T—84-066) Further development and practical use of plants for energy generation from wood and straw in agriculture (rural area). Strehler, A.; Heins, F.; Schulze Lammers, P.; Wasensteiner, J.; Langer, W. NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751775.

Portions are illegible in microfiche products.

Aside of market investigation for several furnace systems and reflections about power generation technical problems of combustion of waste and the tests of different systems had been the basic research work. The efficiency of through burning and bottom burning boilers had been improved. Own constructions of bottom burning boilers were developed to the stage of prototypes. One furnace with automatical charging of chopped straw and woodchips had been developed, this construction is free to be copied by industry. For big woodchips and short woodlogs a prefurnace with bottom burning systems was built. A market investigation study for different types of furnaces shows that in straw combustion there is still a big market potential to be used. Several hot air generators were developed for drying purposes, they are available on the market place meanwhile. More than 20 pilot plants were planned and attended in practice.

32846 (DOE/ER/10531—T1) Influence of the interfacial layer on electrooptical properties of heterojunction solar cells. Final report. Anderson, R.L. (Vermont Univ., Burlington (USA)). 19 Oct 1983. Contract FG02-79ER10531. 37p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013285.

Portions are illegible in microfiche products.

We have investigated the influence on the photovoltaic characteristics of the interfacial (I) layers of silicon oxide which spontaneously form in heterojunction solar cells with Si as active substrate material and SnO_2, In_2O_3 and indium-tin oxide (ITO) as windows. We have verified the reported dependence of the growth rate of the I layer on the Si conductivity type but we disproved the hypothesis that the increased degradation rate of cells with n-Si substrates compared to those with p-Si substrates results from field-enhanced diffusion of O_2^- ions. We have preliminary results which suggest that the conversion efficiency is largely controlled by the sign and quantity of interfacial charge. For large values of open circuit voltage, as required in cells of high efficiency, this charge is positive for cells using p-Si substrate and negative for n-Si based devices. The charge is apparently a result of the fabrication method.

32847 (DOE/JPL/955640—83) Development and fabrication of a solar cell junction processing system. Draft final report. (Spire Corp., Bedford, MA (USA)). Jun 1984. Contract NAS-7-100-955640. 135p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013469.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A program was undertaken to develop, construct and deliver to JPL a processing system capable of producing solar cell junctions by ion implantation followed by pulsed electron beam annealing. The machine was to be capable of processing 4-inch diameter single-crystal wafers at a rate of 10^7 wafers per year. A microcomputer-controlled pulsed electron beam annealer with a vacuum interlocked wafer transport system was designed, built and demonstrated to produce solar cell junctions on 4-inch wafers with an AMI efficiency of 12%. Experiments showed that a non-mass-analyzed (NMA) ion beam could implant 10 keV phosphorous dopant to form solar cell junctions which were equivalent to mass-analyzed implants. A NMA ion implanter, compatible with the pulsed electron beam annealer and wafer transport system was designed in detail but was not built because of program termination.

32848 (DOE/JPL/956205—83/6) Development of metallization process FSA Project, cell and module formation research area. Quarterly technical progress report for the period ending September 30, 1983. Garcia, A. III. (Spectrolab, Inc., Sylmar, CA (USA)). Nov 1983. Contract NAS-7-100-956205. 21p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84004603.

The initial evaluation of the matrix of pastes has been completed. Cells made with these pastes showed high contact and bulk resistance. Shunt resistance was not a problem.

32849 (DOE/JPL/956381—84/1) Evaluation of the ion implantation process for production of solar cells from silicon sheet materials. Final report, 15 December 1982-1 December 1983. Spitzer, M.B. (Spire Corp., Bedford, MA (USA)). Dec 1983. Contract NAS-7-100-956381. 88p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84014177.

This report describes research on the evaluation of the ion implantation process for junction formation in present-day sheet materials, including Czochralski, edge-defined film-fed growth, heat exchanger method, SEMIX, SILSO and dendritic web. Both furnace annealing and low temperature pulsed electron beam annealing are examined and the presence of temperature effects is identified. It is shown that efficiency can be increased by optimization of the thermal processing. A comparison of ion implantation to alternative processes is made. The manner in which high efficiency may be achieved with each of these materials is discussed.

32850 (DOE/JPL/956698—84/2) Process research of polycrystalline silicon material (PROPSM). Quarterly report No. 2, January 1, 1984-March 31, 1984. Culik, J.S. (Solarex Corp., Rockville, MD (USA)). 1984. Contract NAS-7-100-956698. 27p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013353.

The intent of this program is to develop a passivation process (hydrogenation) that will improve the power generation of solar cells fabricated from presently-produced, large-grain, cast polycrystalline silicon (Semix), a potentially low-cost material. The program will consist of two phases. The first objective will be to verify the operation of a DC plasma hydrogenation system and to investigate the effect of hydrogen on the electrical performance of a variety of polycrystalline silicon solar cells. The second objective will be to parameterize and optimize a hydrogenation process for cast polycrystalline silicon, and will include a process sensitivity analysis. The sample preparation for the first phase is outlined. The hydrogenation system is described, and some early results are summarized that we have obtained using our hydrogenation system without a plasma. Light-beam induced current (LBIC) measurements of minicell samples, and their correlation to dark current-voltage characteristics, are discussed.

32851 (FRNC-TH—1320) Electrical properties of submicronic emitters. Application to the case of solar cells and subnanosecond hyperfrequency transitors. Gomina, M. (Caen Univ., 14 (France)). Dec 1981. 113p. (In French). NTIS (US Sales Only), PC A06. Order Number DE84750801.

Paper copy only, copy does not permit microfiche production.

This paper aims at specifying the importance of the main mechanisms which determine the electrical properties of doped p-n junctions until the degenerescence, and of depths below one micron. A concrete aim of this work is the study of the efficiency of injection of the emitter-base junction of subnanosecond bipolar transitors, as also the electrical characteristics of solar cells. These devices are made of silicon. In a first part, the photovoltaic effect, and the technology of solar cells are briefly reviewed; the results of the simple theory of the p-n junction are recalled. In the following part, the contribution of the different regions of the device to the dark current are explained. The relative values of hole and electron currents are discussed, taking into account the values of the main physical parameters in the devices: depth of the junction, concentration gradient in the diffused region, life-time of minority carriers in the emitter, concentration of acceptors in the base. This will allow to point out the parameters of which modifications would lead to a lower value of the dark current; thus, would involve a more important value of the open-circuit voltage. In the third part, a new method to determinate the impurities concentration in the diffused region in the vicinity of the junction, is presented. The emitter regions of the submicronic devices being strongly doped, the performance of these devices are expected to be influenced by a very short life-time of the AUGER type and by a reduction of the width of the energy gap. In the fourth part, the main models of reduction of the width of the energy gap proposed in the literature, are discussed. The fifth part sums up the results of calculation of gain on hyperfrequency NPN type transistors according to the models for strong doping previously discussed.

32852 (FRNC-TH—1517) Filtration and methane fermentation of microscopic algae. Algamar, K. (Montpellier-2 Univ., 34 (France)). Jul 1982. 189p. (In French). NTIS (MF) (US Sales only). Order Number DE84751736.

Microfiche only, copy does not permit paper copy reproduction.

Experimental study of the dynamics of anaerobic digestion, on immersed filters, of microscopic algae, in view of the development of a process which combines, in the same reactor, the collection of algae and intensive fermentation of the fixed biomass.

32853 (NE—1983-6) Terminals for raw products of wood. Present situation and future development. Loenner, G.; Liljeblad, H.; Hjaelm, B.; Strand, H.-O.; Lindqvist, L. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). Feb 1983. 255p. (In Swedish). NTIS (US Sales Only), PC A12/MF A01. Order Number DE84751009.

Portions are illegible in microfiche products.

The goal of this study was to define the concepts of wood processing terminals which are the most interesting ones to develop during the 80ies, to give technical specifications for such components that should be developed, and to propose a programme for continued R and D. The concepts are presented in the form of layouts flow charts and technical descriptions. It has been necessary to make several simplifications and generalizations since the concepts in real life situations are strongly influenced by a number of local conditions. Separately are brief discussions of the possibilities of placing equipment for debarking of chips at the terminals and terminals with stumps as raw material. In the latter case it is concluded that only small modifications need to be made if the stumps are properly cleaned prior to the delivery to the terminals. Storage, drying and pelletizing are described separately, since all terminal concepts presented were designed for undried fuel chips as main product. An economic comparison between the alternative terminal concepts is given. The value of general calculations of the type made in this study is limited. Two main lines can be separated: terminals with mainly mobile equipment and terminals with stationary equipment. Need for government support to R and D exists for terminals with mobile equipment. For the terminal techniques specifically,The following R and D projects are recommended for

governmental support. 1 Research - Study of problems with dirty raw material - Study of chips debarking. 2 Component Development. 3 Pilot Plants (full scale).

32854 **(NE—1983-9) Energy from forest. Project results 3065 09 forest energy.** Nilsson, P.O. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). Mar 1983. 48p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751010.

The Forestry Energy Project at the Swedish University of Agricultural Sciences started in 1977 with the objective to develop necessary knowledge for an increased use of wood fuel in Sweden in order to substitute imported oil. The aim is to describe and analyse systems and machine components to be used in harvesting, transportation, storage and conversion of various forestry energy resources, such as logging residues - tops, branches and stumps from clear cuts - and small trees from thinnings. The systems shall be applicable to demands posed by different categories of forest owners and be designed with consideration to good economy, high availability, and the demand for good working conditions as well as the conservation of nature. The project is financed by the National Swedish Board for Energy Source Development, the total support for the five years July 1977 - June 1982 being close to 15 million Swedish Crowns. In this summary report of the first five years a survey is given of the results obtained so far in view of the general development in the field.

32855 **(NE—1983-18) Biological production of energy carriers and chemicals from peat and wood. A literature study.** Hahn-Haegerdahl, B.; Mattiasson, B.; Nilsson, J.L. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). 1983. 149p. (In Swedish). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84751006.

Portions are illegible in microfiche products.

The potential for producing energy and chemicals from peat and wood using biological processes either solely or integrated with thermal, physical and chemical processes has been reviewed on the basis of current literature reports. The availability of the raw material in Sweden and its chemical composition are reported. Energy related products and oil sparing chemicals which might be produced from peat and wood have been identified. Prices and markets have - when possible - been estimated. Advantages and disadvantages of mechanical, thermal and chemical pretreatments of lignocellulosic materials have been reviewed. Special emphasis has been given to the relation between pretreatments and the extremely high water content of peat. Biotechnological treatments such as enzymatic hydrolysis and fermentation of lignocellulosic materials are reported. Methanogenesis and inhibited methanogenesis are especially discussed. Available process technology and future process technologies derived from current research programs have been summarized.

32856 **(PB—84-163450) Study of coupling and protecting solar arrays of photovoltaic cells with the aim of obtaining high direct current voltages. Final report.** Forge, F. (Commission of the European Communities, Luxembourg). 1982. 48p. (In French). (EUR—8143-FR). NTIS, PC E03/MF E03.

Arrays of photovoltaic cells may be used as rural power sources, but are subject to problems in cases of short circuit, open circuit, or masking of individual elements. The breakdown voltage values for a selection of cells are examined as well as the theoretical consequences for different cell assemblies following cell failure.

32857 **(PB—84-163567) Study and promotion of epitaxial growth of compounds III/5 by the mixed pyrolysis of organometallics and hydrides at reducted pressure: application to the study of solar cell structures.** Gave, G.; Le Metayer, M.; Orgeret, M. (Commission of the European Communities, Luxembourg). 1983. 25p. (EUR—8207-FR). NTIS, PC E03/MF E03.

The study of the epitaxial growth of Group III/5 elements in semiconductors by organometallic methods and based on the heterostructure GaAlAs/GaAs, has been reported previously. A study of this low pressure technique has enabled production of photovoltaic solar cells. The parameters influencing growth have been investigated, in particular, length, temperature, pressure, and concentration. However, because the reducing property of Al in GaAlAs gives rise to difficulties, the use of the homostructure GaAs has been suggested. A photovoltaic gallium arsenide solar cell was therefore produced by the above method, using the MESA technique for making eight solar cells on a substrate. The output of the device is presented. The technique appears to offer a simple method for producing solar cells.

32858 **(PB—84-163633) Study of the technology of a solar module offering good thermal dissipation. Final report.** Diguet, D.; Anguet, J. (Commission of the European Communities, Luxembourg). 1982. 72p. (In French). (EUR—8159-FR). NTIS, PC E04/MF E04.

The first phase of RTC's research program to develop a solar module involved the investigation of possible ways for fixing cells to a dissipative support and their correlation with the theoretical study of the thermal module. The program was divided into three parts: (1) the evaluation of different types of materials and support structures in practical trials to establish the most promising initial solutions, (2) the development of a model to analyze the relative importance of the parameters influencing thermal dissipation and its verification by measurements on an actual module, and (3) the analysis of the samples of dissipating modules chosen to estimate the benefits brought about by the different structures and to refine the previously developed thermal model.

32859 **(PB—84-163864) Seaweed raft and farm design in the United States and China.** McKay, L.B. (New York Sea Grant Inst., Albany (USA)). 1983. 108p. NTIS, PC A06/MF A01.

Sponsored in part by New York State Energy Research and Development Authority, New York, Gas Research Inst., Chicago, IL, and New York Gas Group, NY.

The following topics are discussed in this report: pilot-scale mariculture of seaweeds in Washington; experimental-scale raft culture of marine macroalgae in inland marine waters; macroalgal culture in California and China; land-based cultivation of seaweeds: an assessment of their potential yields for 'energy farming'; a design for energy-independent seaweed raft culture in tidal creeks and rivers; and the New York State marine biomass program.

32860 **(PB—84-164532) Study of improvements to Schottky diodes on amorphous silicon, prepared by cathodic sputtering. Final report.** Vieux-Rochaz, L. (Commission of the European Communities, Luxembourg). 1982. 51p. (In French). (EUR—8195-FR). NTIS, PC E04/MF E04.

Schottky diodes on amorphous hydrogenated silicon have been successfully prepared, each layer of the structure having been deposited by cathodic sputtering. Electrical measurements show that the diodes are good quality rectifiers with a current saturation in darkness of the order of 10 to the minus 12 power A/sq cm and barrier levels reaching 1.2eV under illumination of 100mW/sq cm; certain diodes deliver a short-circuit current of 10mA/sq cm and an open circuit voltage of 600mV without having an anti-reflection layer. It is shown that an anti-reflection layer, likewise deposited by cathodic sputtering, increases the short-circuit current by 43% and ensures good protection of the cells against the action of harmful atmospheric gases.

32861 **(PB—84-169085) Appropriate technology: results of studies by the Mechanical Engineering Department of the University of the Andes.** (Universidad de Los Andes, Bogota (Colombia). Centro de Estudios e Investigacion). 1983. 315p. (In Spanish). (D—1). NTIS, PC A14/MF A01.

This report presents 89 summaries of appropriate technology projects in the fields of agroindustry, central heating, biomass, wind energy, hydraulics, civic works, refrigeration, water treatment, and agricultural waste. Each summary gives sufficient information to decide whether one should initiate such a project, the results obtained, and the people and organizations who obtained these results.

32862 (SAND—83-2375C) Thermal conductivity and interface resistance of particle-filled silicone resin. Schwinkendorf, W.E.; Moss, M. (BDM Corp., Albuquerque, NM (USA); Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 8p. (CONF-840816—10). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011681.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

Portions are illegible in microfiche products.

The thermal conductivity of silicone resin containing various amounts of Al_2O_3, MgO, BN and copper particles was measured with a Colora Thermoconductometer. Samples consisted of aluminum and alumina discs bonded with unfilled or particle-filled resin. Most particle loaded samples displayed a conductivity that declined with decreasing bond thickness. This is due to a measurable interface thermal resistance which probably results from the increased viscosity and reduced wetting ability of particle-loaded resin. Microscopic examination of bond cross sections revealed such areas of incomplete contact. No interface resistance was observed for unfilled resin where wetting appeared complete.

32863 (SAND—84-0053C) Comparative evaluation of new low-cost array field designs for grid-connected photovoltaic systems. Post, H.N.; Noel, G.T. (Sandia National Labs., Albuquerque, NM (USA); Battelle Columbus Labs., OH (USA)). 1984. Contract AC04-76DP00789. 7p. (CONF-840804—4). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84010978.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

New array field designs which have been developed to minimize the balance-of-system (BOS) cost for grid-connected photovoltaic (PV) systems are examined. Previous experience with intermediate-size systems experiments has shown the array field BOS to be a major cost contributor to PV systems, with BOS costs in the range of $5/W/sub p/ and up. These new designs which are appropriate for both intermediate and large-size ground-mounted flat plate arrays have significantly reduced the BOS cost. Key features of the array field BOS components including structures, foundations, intermodule connection, field wiring, and system grounding are identified for each design. Cost projections as well as cost experience on prototype and full-scale installations are presented and compared. It is concluded that $0.50/W/sub p/ for the array field BOS is achievable for large - size systems.

32864 (SAND—84-0244C) Concentrating photovoltaic technology. Edenburn, M.W. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 16p. (CONF-840845—1). NTIS, PC A02/MF A01. Order Number DE84012275.

From 10. annual conference of the Solar Energy Society of Canada; Calgary, Canada (2 Aug 1984).

This paper will summarize the status and discuss likely future directions of photovoltaic concentrator technology. A current commercial Si cell module has a peak efficiency of 15.5%, and 17% has been reached with an experimental module. Advanced cells and module design improvements offer still higher efficiencies. Concentrator Fresnel lens array fields installed several years ago have all demonstrated very good electrical performance with little performance degradation. Fresnel lens arrays were commercially available and prices of $7/watt for installed one megawatt systems have been quoted. Cost projections predict that current technology concentrating PV arrays can be installed for less than $2/watt if they are manufactured in large, steady quantities. More advanced designs may cost even less.

32865 (SERI/STR—211-2308) Cadmium sulfide/copper ternary heterojunction cell research semiannual report, 1 July 1983 - 31 December 1983. Devaney, W.E.; Mickelsen, R.A.; Chen, W.S.; Hsiao, Y.R.; Stewart, J.M.; Olsen, L.C.; Rothwarf, A. (Boeing Engineering and Construction Co., Seattle, WA (USA)). May 1984. Contract AC02-83CH10093. 171p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84004511.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The properties of polycrystalline, thin-film $CuInSe_2$/CdS and CdZnS solar cells prepared by vacuum evaporation techniques onto metallized alumina and glass substrates are described. Cells on glass substrates are reported to show higher V/sub oc/'s but lower I/sub sc/'s than alumina substrate cells. Preparations for the deposition of CuIn/sub 1-x/Ga/sub x/Se_2 films in a planetary apparatus and initial results on annealing of $CuInSe_2$ films in H_2Se environments are discussed. Thermally Stimulated Capacitance (TSCAP) and Isothermal Capacitance Transient Spectroscopy (ICTS) results on $CuInSe_2$ cells are reported. The development of film and device analysis techniques including SEM, EDS and EBIC are described and typical results are presented. Low temperature (12°K) photoluminescence of $CuInSe_2$ films excited with a He-Ne laser is discussed along with a proposed energy level model. Finally, results are presented from two subcontractors (Drexel University and JCGS) pertaining to cell analysis and theoretical cell mechanism studies.

32866 (SERI/TP—212-2323) CdS/$CuInSe_2$ heterojunction cell research. Noufi, R.; Axton, R.; Cahen, D.; Deb, S.K. (Solar Energy Research Inst., Golden, CO (USA)). May 1984. Contract AC02-83CH10093. 7p. (CONF-840561—13). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84004508.

From 17. IEEE photovoltaic specialists conference; Kissimmee, FL, USA (1 May 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The objective of this research is (1) to fabricate and characterize $CuInSe_2$ thin films and (2) to fabricate and characterize CdS/$CuInSe_2$ solar cells. The material can be deposited either n- or p-type with mobilities of up to 150 cm^2/V s and carrier concentrations ranging from 10^{13} to 10^{20} cm^{-3}. X-ray diffraction reveals a single phase with strong preferred orientation along <211> and <112> directions. The basic device structure of the cell consists of two $CuInSe_2$ layers, varying in the stoichiometry of elements and electrical properties, and two layers of CdS. Composition studies as well as electrical property measurements of the two layers were carried out to illustrate the role of the two layers of $CuInSe_2$. The methods used and results are discussed in detail and a conclusion is drawn as to whether the two layers in an actual device can be eliminated by using a single layer of intermediate composition and electrical properties.

32867 (SERI/TR—9171-1-T2) Low-cost silicon substrates by directional solidification. Final report. Schmid, F.; Khattak, C.P. (Crystal Systems, Inc., Salem, MA (USA)). Dec 1982. Contract AC02-77CH00178. 93p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84011552.

A one-year effort was carried out to evaluate the use of directional solidification of commercially available metallurgical grade (MG) silicon by the Heat Exchanger Method (HEM) to produce substrates suitable for solar cell fabrication. Metallurgical grade (MG) silicons from numerous sources world-wide were evaluated and it was found that the impurity content varied depending upon the purity of the raw material, mix used in the arc furnace, processing and handling techniques used in the MG silicon plant. In all cases very effective segregation of impurities was seen and single crystal structure was achieved in ingots after directional solidification by HEM; the amount of single crystal material varied with the source of meltstock and processing parameters in the furnace. The HEM furnace was used to melt and hold the material for in situ refinement prior to directional solidification. The effect of vacuum, slagging, stirring of the melt, moist argon blowing through the melt and double solidification were studied on the refinement of MG silicon. The sensitivity of these processing techniques was evaluated as a function of time and temperature in some cases. The moist argon blowing and double solidification were found to be the most effective processing techniques to reduce impurities. It is possible to combine slagging and moist argon blowing to achieve more effective purification. It was shown that 7.2% efficient diffused solar cells and 11.84% epitaxial cells can be fabricated from HEM solidified material using commercially available MG silicon. Shunting of cells was observed in the area of SiC particles and this is

attributed to the high carbon content of the MG silicon. The most serious limitation of using this approach is therefore the carbon content of the MG meltstock. MG silicon from India and South Africa were found to be the best sources of MG silicon for this approach.

32868 **Process studies for enzymatic hydrolysis using high solids slurries of acid pretreated mixed hardwood.** Allen, D.C.; Grethlein, H.E.; Converse, A.O. (Dartmouth Coll., Hanover, NH). *Biotechnology and Bioengineering Symposium;* No. 13, 99-111(1983). (CONF-830567—).

From 5. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN, USA (10 May 1983).

Average glucose yields of 87, 75, and 67% have been obtained from 10, 15, and 20% slurries, respectively, following 24-h enzymatic hydrolysis of acid pretreated mixed hardwood with an enzyme:solids ratio of 16.7 IU/g using Rutgers C30 cellulase. After 12 h the yields are only about 10% lower that after 24 h. When the enzyme:solids ratio is decreased to 8.3 IU/g, the glucose yields is 74, 59, and 50% for 10, 15, and 20% solids, respectively, in 24 h. The glucose yields achieved following acid pretreatment in a plug flow reactor are significantly higher than those reported in the literature at these high slurry concentrations. 20 references, 1 figure, 6 tables.

1406 Photovoltaic Power Systems

REFER ALSO TO CITATION(S) 32863, 32914, 32935

32901 **(BMFT-FB-W—84-010) Study report on a modular photovoltaic power supply system for space application.** Baune, M.; Bittner, H.; Eggers, G.; Goergens, B.; Huettmann, H.J.; Huse, K.; Mansholdt, U.; Roth, M.; Schneider, K.; Westphal, W. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.); ERNO Raumfahrttechnik G.m.b.H., Bremen (Germany, F.R.)). Mar 1984. 9p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751768.

Portions are illegible in microfiche products.

A modular photovoltaic power supply system is being defined, with a power output of approximately 10 to 30 KW for space application in the coming decades up to the year 2000. The report comprises the probable scenario for application, the system requirements derived, the system and generator definition including electrical and mechanical aspects, the analysis of the dynamic behaviour, control and stabilization of the large array, blanked design and problem areas, power conditioning and energie storage, the spectrum of possible applications, the development and cost planning.

32902 **(DOE/ET/20630—T1) Intermediate Photovoltaic System Application Experiment. Oklahoma Center for Science and Arts. Phase II. Final report.** (Science Applications, Inc., McLean, VA (USA)). Jan 1984. Contract AC04-79ET20630. 60p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84012791.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report presents the key results of the Phase II efforts for the Intermediate PV System Applications Experiment at the Oklahoma Center for Science and Arts (OCSA). This phase of the project involved fabrication, installation and integration of a nominal 140 kW flat panel PV system made up of large, square polycrystalline-silicon solar cell modules, each nominally 61 cm x 122 cm in size. The output of the PV modules, supplied by Solarex Corporation, was augmented, 1.35 to 1 at peak, by a row of glass reflectors, appropriately tilted northward. The PV system interfaces with the Oklahoma Gas and Electric Utility at the OCSA main switchgear. Any excess power generated by the system is fed into the utility under a one to one buyback arrangement. Except for a shortfall in the system output, presently suspected to be due to the poor performance of the modules, no serious problems were encountered. Certain value engineering changes implemented during construction and early operational failure events associated with the power conditioning system are also described. The system is currently undergoing extended testing and evaluation.

32903 **(NASA/CR—3338-Vol.1) Solid state SPS microwave generation and transmission study. Volume I. Phase II final report.** Maynard, O.E. (Raytheon Co., Wayland, MA (USA)). Nov 1980. Contract AI01-79ER10035. 237p. NTIS, PC A11/MF A01; 1; GPO Dep. Order Number DE84012300.

Portions are illegible in microfiche products.

The purpose of this investigation was to further define the solid state sandwich concept for SPS. The design effort concentrated on the spacetenna, but did include some system analysis for parametric comparison reasons. The study specifically included definition and math modeling of basic solid state microwave devices, an initial conceptual subsystems and system design, sidelobe control and system selection, an assessment of selected system concept and parametric solid state microwave power transmission system data relevant to the SPS concept. Although device efficiency was not a goal of this study, the sensitivities to design of this efficiency were parametrically treated. Sidelobe control consisted of various single step tapers, multistep tapers and Gaussian tapers. A preliminary assessment of a hybrid concept using tubes and solid state is also included. There is a considerable amount of thermal analysis provided with emphasis on sensitivities to waste heat radiator form factor, emissivity, absorptivity, amplifier efficiency, material and junction temperature. The document is organized to provide useful design data for future studies, identify issues associated with the solid state sandwich design, and estimate technology requirements.

32904 **(PB—84-163575) Power conditioning for a 1 kw photovoltaic power supply. Final report.** Jalade, J.; Marpinard, J.C.; Valentin, M. (Commission of the European Communities, Luxembourg). 1982. 133p. (In French). (EUR—8209-FR). NTIS, PC E07/MF E07.

Changing weather conditions, fluctuating energy demand, and the need for energy storage are considered to be the main problems to be met in the design of a photovoltaic power supply. Each problem is analyzed and an optimum solution proposed, in which, under maximum insolation, surplus energy is stored in batteries for use during less favorable conditions. The main part of the report is concerned with the simulation of such a solar power supply by employing a hybrid system which takes advantage of the complementary features of the MITRA 15 digital and the EAI680 analog computers. The sensitivity of the design to variations in the main parameters is tested.

32905 **(PB—84-164557) Demonstration of a photovoltaic electricity supply of 5 kW peak power and its application to a domestic dwelling. Final report.** Belluque, J.; Naaijer, G.J. (Commission of the European Communities, Luxembourg). 1982. 49p. (In French). (EUR—8152-FR). NTIS, PC E03/MF E03.

The aim is to design an energy conditioning system for a solar house powered by a 5 kW photocell array, a prototype of which is to be installed at Sophia Antipolis by OMERA. The LEP study had several concrete positive results leading to the concept of a homogeneous overall system and the installation of an economic 'all AC' electrical distribution network.

32906 **(PB—84-165661) Free-standing 5kW photovoltaic generator at Refuge des Evettes: conception, analysis of the system, implementation, and testing. Final report Sep 79-Aug 80.** Aubert, B. (Commission of the European Communities, Luxembourg). 1982. 53p. (In French). (EUR—8204-FR). NTIS, PC E04/MF E04.

By September 1979, the photovoltaic generator had been assembled on site. Examination showed that the photovoltaic panels were not damaged by snow during the winter and that the storage battery had withstood the freezing temperatures. The generator was put into use in June 1980. The project provides quantitative results on the amount of solar energy produced.

32907 **(SAND—83-7018) Dynamic simulation of dispersed grid-connected photovoltaic power systems: Task 1 - modelling and control.** Carroll, D.P.; Gareis, G.E.; Krause, P.C.; Ong, C.M.; Schwartz, R.J.; Wasynczuk, O. (Purdue Univ., Lafayette, IN (USA). School of Electrical Engineering). Nov 1983. Contract AC04-76DP00789. 131p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013631.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

For purposes of analysis and investigation, four power conditioning subsystems were selected as representative of photovoltaic systems. Two of these systems were single phase arrangements with power levels (5 to 10 kW) in the range of residential applications. The other two were three phase systems representative of power levels of 250 kW to several megawatts. Each system included an array, an inverter with control circuitry, and harmonic filters. Each system was assumed to be connected to a simplified equivalent of a power system. The first objective was to provide detailed representations of each of the four systems by simulating each of the systems on the hybrid computer at Purdue. The array was simulated using an aggregate model determined from digital computer studies of series and parallel strings of non-identical cells. These aggregation studies revealed that the Turfler aggregate model was sufficient to provide an adequate representation of a large array. The converters were simulated in enough detail to portray the switching of each valve within the converter. The primary control (cosine comparator for phase locked oscillator) was also simulated in detail. The secondary control for each converter was a voltage control. Computer traces are given that show the steady-state performance of each of the converter systems. Next, the peak power tracking controls were incorporated into the simulation. These controls

adjust the array voltage so that maximum power conversion is achieved for the given atmospheric conditions. A new method employing an incremental conductance measurement in the peak power tracking was developed. The start-up characteristics and the response of the converter systems during cloud cover transients were investigated using pilot cells and the incremental conductance methods. The systems responded in a satisfactory manner with no indication of instability due to control interaction.

32908 **(SAND—84-0874C-Draft) Photovoltaic system overview.** Sutton, P.D.; Jones, G.J. (Bechtel Power Corp., Los Angeles, CA (USA); Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 25p. (CONF-840804—2-Draft). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84010599.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

This paper provides a brief overview of utility-connected photovoltaic energy systems. It begins by discussing the major elements of the photovoltaic system: the collector, the array field and the power conditioner. Each of these elements is described and the current status of technology development for each is reviewed. We then discuss how these elements are interconnected and the impact of subsystem efficiency on system output. Finally we discuss the issues of system cost and system energy value. The photovoltaic systems are shown to be simple, well defined energy sources with a large potential but geographically limited market.

32909 **(SAND—84-0896C) Future for residential photovoltaic systems.** Thomas, M.G.; Royal, G.C. (Sandia National Labs., Albuquerque, NM (USA); AIA Foundation, Washington, DC (USA)). 1984. Contract AC04-76DP00789. 6p. (CONF-840804—9). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011483.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

Residential photovoltaic systems represent a huge potential market. Residential loads represent about one-third of the electrical use in the United States. With the anticipated reduction in module costs to the $2.00/W/sub p/ level, and a building block approach described in this paper, no technical impediments remain for residential photovoltaics. Public acceptance of this alternate is, however, still an open question.

32910 **(SAND—84-1091C) Power conditioning for grid-connected PV systems less than 250 kW.** Key, T.S. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 7p. (CONF-840804—21). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013058.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

Power conditioning development for grid-connected photovoltaic (PV) applications has been underway for the past five years at Sandia Laboratories. Although the dc source is a photovoltaic array, many of the advances and lessons learned have general applicability to any dispersed generation source connected to the electric utility grid. Progress in single phase (2 to 10 kW) and three phase (20 to 250 kW) hardware will be covered. Results from a detailed hardware evaluation program will be reviewed. Cost and efficiency experience and future projections will be summarized.

32911 **(SERI/TR—254-1903) Photovoltaic systems for residential applications: a survey of recent literature.** Sillman, S.; Weber, K.; Koontz, R.; Christensen, C.; Hawkins, D. (Solar Energy Research Inst., Golden, CO (USA)). Apr 1984. Contract AC02-83CH10093. 238p. NTIS, PC A11/MF A01; 1; GPO Dep. Order Number DE84004502.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

In recent years extensive research has been conducted in the development of residential photovoltaic systems. In this report ninety recent major publications documenting this research were selected and summarized. These selections, which include comprehensive reports as well as recent conference papers and journal articles, are a subset of the comprehensive bibliography of publications on residential PV design found in the appendix of this report. The selected publications are organized into eight topical sections ranging from simulation and design guides to utility-based value. Each individual summary consists of three sections: an overview, a list of major assumptions, and the report conclusions. This organization serves not only to guide the researcher seeking information on specific topics, but also allows the quick comparison of major assumptions and results of different studies.

1407 Solar Thermal Power Systems

32912 **(BMFT-FB-T—84-024) Kuwait, phase 3/stage 1 'Application and test program for the Sulaibyah food/water/power system'.** Zewen, H.; Schmidt, G.; Oechslein, W. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.); Messerschmitt-Boelkow-Blohm G.m.b.H., Muenchen (Germany, F.R.). Unternehmensbereich Raumfahrt, Antriebe und Energietechnik). Jan 1984. 91p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751423.

Portions are illegible in microfiche products.

Objectives are operational tests of the components of a solar thermal power station in the 100 kWe/700 kWth power range as well as the connection of the first electrical users to the power station. The work program includes: a) performance tests of the collector field, the thermal storage, the energy conversion system, and the control of the system; b) operational experiences and results of the solar thermal power station; and c) connection of electrical users to the power station. The performance measurements demonstrated the required mechanical and electrical readiness of the power station. The following operational test phase covered a period of approximately 2 years. The other components belonging to the research program, e.g. the weather-station and the data acquisition system were delivered and installed on time and are working properly. Additional electrical users are a brackish water submersible pump set, as well as a reserve osmosis desalination unit. The Kuwait partner (KISR) has been introduced in the operation of the power station. Since the beginning of 1982, the power station is operated mainly by Kuwait staff members.

32913 **(SAND—84-0313) Bibliography of reports of the Sandia Solar Thermal Distributed Receiver Systems Project.** Leonard, J.A.; Klimas, C.R. (eds.). (Sandia National Labs., Albuquerque, NM (USA)). Apr 1984. Contract AC04-76DP00789. 55p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013208.

This document, which is a bibliography of solar thermal distributed receiver reports and publications by Sandia Laboratories and its contractors, is provided as a convenient reference for those interested in solar thermal technology. Reports are listed by principal author, by report numbers, and by unnumbered reports.

32914 **(SAND—84-0703) Thermal modeling of line focus photovoltaic systems.** Beraun, R. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1984. Contract AC04-76DP00789. 66p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013920.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report addresses the methodology and results of a detailed thermal analysis performed on two photovoltaic systems. System one consists of the Sandia National Laboratories second generation, 92° rim angle, parabolic-cylindrical solar collector as the concentrator developed by the Energy Technology Center of E-Systems Inc. First, a brief description of the systems under investigation and the photovoltaic process is given. Then the methodology and the mathematical algorithm involved in developing the models are presented.

32915 **(SERI/TR—252-2164) Direct-contact condensers for solar pond power production.** Fisher, E.M.; Wright, J.D. (Solar Energy Research Inst., Golden, CO (USA)). May 1984. Contract AC02-83CH10093. 75p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84004510.

The use of a direct-contact condenser as a way of reducing the cost of electricity from an organic Rankine cycle power plant coupled to a solar pond is examined. Three possible direct-contact heat exchangers are considered: drop-type, bubble-type, and packed-bed. Each condenser is designed to operate with a deaerator and a degasser to reduce contamination and loss of working fluid. Appropriate correlations and models from the literature for heat and mass transfer, particle terminal velocity, and particle production are presented. Each piece of equipment is sized and costed. Finally, the cost of the entire power plant is compared with that of a plant using a conventional shell-and-tube condenser. For two of the three direct-contact designs, a reduction in the cost of electricity is estimated. However, the reduction is not significant enough to compensate for the uncertainties involved in the relatively new technology of direct-contact heat transfer.

1408 Ocean Energy Systems

32929 **(CONF-840816—11) Biofouling control for marine heat exchangers using intermittent chlorination.** Panchal, C.; Larsen-Basse, J.; Little, B. (Argonne National Lab., IL (USA); Hawaii Univ., Manoa (USA). Dept. of Mechanical Engineering; Naval Ocean Research and Development Activity, NSTL, MS (USA)). 5 Aug 1984. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011738.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

Portions are illegible in microfiche products.

Biofouling control for marine heat exchangers is being investigated at the Natural Energy Laboratory of Hawaii (NELH) to determine the effectiveness of low levels of chlorination in the range of 25 to 70 ppb. Two series of tests were conducted using warm surface seawater: (a) intermittent chlorination for the prevention of biofilm formation, and (b) intermittent and continuous chlorination for the removal of an established biofilm from heat exchangers exposed to flowing seawater. A relationship between the rate of removal of biofilm and chlorine consumption has been established. Tests using deep, cold water showed negligible biofouling for an extended period of time, and therefore no chlorination was needed

to control of biofouling. Corrosion-resistant materials (titanium and AL-6X stainless steel) were used in these experiments.

32930 **(PB—84-185230) Shelf mounted Ocean Thermal Energy Conversion platform (revised preliminary report).** (CBI Industries, Inc., Oak Brook, IL (USA)). Mar 1984. 39p. NTIS, PC A03/MF A01.

This report relates model tests of a generic Ocean Thermal Energy Conversion (OTEC) platform. The objective of these tests is to aid in the evaluation of new OTEC designs and to present a data base for design purposes. The test plan has been designed to provide a data base for design purposes. The test plan has been designed to provide a data base for comparison with current and projected analytical tools as well as comparisons of results from one model configuration to another. The new conceptual OTEC designs are different from the typical offshore (jacket type) structure which is quite transparent to waves. The major difference is the addition of large submerged power production modules to the frame. These proposed modules offer a large surface area to obstruct the flow and thereby increase the global wave forces acting on the structure. Three parameters can be identified to characterize the effect that the obstruction has on the hydrodynamical forces. They are the amount of blockage present, the location of the blockage and the manner in which blockage is realized.

1409 Solar Thermal Utilization

REFER ALSO TO CITATION(S) 32952, 33540

32932 **(BFR-R—40-1983) Solar collectors and heat store in a system using air as the energy carrier.** Ottosson, H. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1983. 107p. (In Swedish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84751015.

The objective of this project has been to develop an airborne space heating system for detached houses, based on solar collectors and a heat storage. It was felt that the incorporation of a high standard of thermal insulation would enable space heating requirements to be met by the ordinary ventilaion system if the air flow was increased somewhat. Project work included development of simple air-cooled solar collectors and a suitable heat storage. The principle of using the ventilation system as a heating system operated satisfactorily, and no direct problems with cold down-draughts or draughts were encountered. In terms of efficiency, the design of the solar collector was comparable with an equivalent water-cooled collector. The collectors tested exhibited long annual utilization times, due partly to the lower thermal capacity of air as opposed to that of water. The design of the stone heat storage was less satisfactory in terms both of the living environment and of cost. Project work was therefore concentrated instead on a latent heat storage, using calcium chloride as the storage medium. Technical performance of this storage was good. Excessive marginal costs prevented this project from being developed to reach the commercial stage. As long as direct electric heating is competitive application of this particular method of heating for detached houses appears to be uneconomic.

32933 **(DOE/CE/15140—T1) Technical evaluation of a solar heating system having conventional hydronic solar collectors and a radiant panel slab. Final report.** Starr, R.J. (Solar Option One Co., Lyndonville, VT (USA)). Apr 1984. Contract FG01-82CE15140. 93p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84009556.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A simple innovative solar heating design (Solar Option One) using conventional hydronic solar collectors and a radiant panel slab was constructed. An objective of hybrid solar design is to combine the relative advantages of active and passive design approaches while minimizing their respective disadvantages. A test house using the Solar Option One heating system was experimentally monitored to determine its energy based performance during the 1982-83 heating season. The test residence is located in Lyndonville, Vermont, an area which has a characteristically cold and cloudy climate. The two story residence has a floor area of about 1400 square feet and is constructed on a 720 square foot 5.5 inch thick floor slab. A 24 inch packed gravel bed is located beneath the slab and the slab-gravel bed is insulated by two inches of polystyrene insulation. The test building is of frame construction and uses insulation levels which have become commonplace throughout the country. The structure would not fall into the superinsulated category but was tightly constructed so as to have a low infiltration level. The building is sun-tempered in that windows were concentrated somewhat on the South side and all but avoided on the North. A solar greenhouse on the South side of the building was closed off from the structure permanently throughout the testing so as to better observe the solar heating invention without confounding variables. The monitoring equipment generated an internal gain of about 17,000 BTUs per day, roughly the equivalent of occupancy by two persons. A full description of the experimental testing program is given. System efficiency and performance are reported.

32934 **(DOE/CS/23986—T1) North Carolina energy conservation plan. Final program report.** (Northampton County Board of Education, Jackson, NC (USA)). 1984. Contract FG01-80CS23986. 12p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013287.

The Energy Conservation Project's objective was to alert and bring the schools and communities together to conserve energy, making them aware of the energy crisis as well as involve them in energy conservation techniques through surveys, materials, supplies, reviews, energy trends and activities such as live projects in construction of solar panels, cookers, handbooks, workshops, etc. Areas of energy waste were pointed out and dealt with. The project also suggested ways and means of providing for the utilization of natural resources to reduce cost of heating, cooling, lighting and water. The project served to eliminate a large quantity of energy for the schools and communities; students and teachers by participation in the program. The objectives of the project were accomplished and the lack of knowledge of the energy crisis is no longer a myth. The LEA supplemented the project funds in the purchasing of materials, supplies, secretarial assistance, workshops, energy conferences, printing, and consultants fees. The project was a success.

32935 **(DOE/CS/30205—T2) Hybrid solar thermal-photovoltaic systems demonstration, Phase I and II. Final technical progress report, July 5, 1979-December 1982.** Loferski, J.J. (ed.). (Brown Univ., Providence, RI (USA). Div. of Engineering). Dec 1983. Contract AC03-79CS30205. 285p. NTIS, PC A13/MF A01; 1; GPO Dep. Order Number DE84011814.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The purpose of the project is to investigate a system based on combined photovoltaic/thermal (PV/T) panels to supply the energy needs of a small single family residence. The system finally selected and constructed uses PV/T panels which utilize air as the heat transfer medium. Optimization of thermal performance was accomplished by attaching metal fins to the back surface of each cell which significantly increased the heat transfer coefficient from the solar cells to the air stream. The other major components of the selected system are an air-to-air heat pump, a rock bin thermal energy storage bin, a synchronous dc-to-ac converter, a microprocessor to control the system, a heat exchanger for the domestic hot water system and of course the building itself which is a one story, well insulated structure having a floor area of 1200 ft^2. A prototype collector was constructed and tested. Based on this experience, twenty collectors, containing 2860 four inch diameter solar cells, were constructed and installed on the building. Performance of the system was simulated using a TRNSYS-derived program, modified to accommodate PV/T panels and to include the particular components included in the selected system. Simulation of the

performance showed that about 65 percent of the total annual energy needs of the building would be provided by the PV/T system. Of this total, about one half is produced at a time when it can be used in the building and one half must be sold back to the utility.

32936 **(DOE/CS/30397—T1) Performance evaluation of the Shenandoah Community Solar Recreational Center for the year 1980. Final report.** Craig, J.I.; Jeter, S.M. (Georgia Inst. of Tech., Atlanta (USA)). Dec 1983. Contract AS05-79CS30397. 61p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013274.

Portions are illegible in microfiche products.

The Shenandoah Solar Recreational Center, when completed in early 1977, was the largest building to have most of its heating, air conditioning, and hot water needs met by solar energy. Principal components of the building solar energy system are a 1121 sq-m array of modularized flat plate collectors with 2300 sq-m of aluminum foreground reflectors integrated into a sawtooth wood truss roof, a 15.1 cu-m collector loop buffer tank, a 56.8 cu-m hot water storage tank, two 113.6 cu-m chilled water storage tanks, and a nominal 100 ton single stage absorption chiller. The system is interconnected by means of primary-secondary loops and was designed for simultaneous operation of all subsystems in either the heating or cooling modes. Control is by means of conventional HVAC pneumatic and electric control equipment. Transient thermal simulation studies were used to design the solar energy system. The collector array size was fixed so as to provide a significant fraction of the building annual thermal load, and the hot and chilled water storage volumes and other system functions were sized to maximize economic benefit. On this basis the predicted solar fractions were 95% space heating, 64% space cooling and 50% hot water. The building operation was monitored for a period on one year (February 1980 through February 1981) using a calculator-based data acquisition system with 80 sensors located throughout the building. This report presents an analysis of this data and an evaluation of the building performance over the year. The annual collector efficiency was found to be 19% and the overall annual solar fraction (combined thermal loads met from solar) was determined to be 39%. It is felt that this level of performance for a demonstration system is quite acceptable.

32937 **(DOE/CS/32396—T1) Radian solar heating and cooling demonstration project. Final report.** (Radian Corp., Austin, TX (USA)). Apr 1980. Contract AC01-76CS32396. 38p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013289.

A solar heating and cooling system was designed and installed for part of the Radian Corporation office complex in Austin, Texas. The major components of this system include 36 Northrup collectors, a 1500 gal. thermal storage tank, an ARKLA absorption cooling unit and cooling tower, a Servel heating coil, pumps, heat exchanger, and a conventional back-up heating and air conditioning unit. The design and operation of the system are presented. The cost of the major components and the cost of installing the system are presented.

32938 **(DOE/R7/01142—T1) Code complying solar greenhouse designs for Region VII environments. Final report.** (Solar Greenhouse Association, Webster Groves, MO (USA)). 31 Mar 1983. Contract FG47-80R701142. 54p. NTIS, PC A04; 3; GPO Dep. Order Number DE84007855.

Paper copy only, copy does not permit microfiche production.

Experiences designing, building, demonstrating, and operating prototype code conforming solar greenhouses suitable to urban environments characteristic of those in the US DOE Region VII are reported. Five conceptual solar greenhouse designs were developed as most applicable to the likely objectives, sites and buildings of urban homeowners and as suitable to the demonstration of appropriate principles, materials, and techniques. Some of this development was based upon a comprehensive survey of all of the residential neighborhoods in the City of Saint Louis undertaken just prior to this program. That study had concluded that: better than 25% of the existing single family homes in St. Louis have sites and orientations suitable to the incorporation of a classic lean-to solar greenhouse or similar solar improvement. In another 10% useful solar access is limited to approaches confined within some part of the existing building envelope other than the front face. Almost another 30% have south facing fronts having good to excellent solar access but building setback restrictions and/or front facade design prohibiting any kind of additional structure. Roof top solar additions are possible for a large number of these. Rooftop solar additions are also possible for another 12% having east or west facing fronts.

32939 **(LA-UR—84-499) Preliminary model for heat transport within a tongue-and-reservoir liquid diode for passive solar heating.** Jones, G.F. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 33p. (CONF-840816—8). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84007504.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

Portions are illegible in microfiche products.

A preliminary model is presented for heat transport within a tongue-and-reservoir liquid diode for passive solar heating. The diode consists of a rectangular vertical slot (tongue) extending from the bottom of a rectangular-shaped reservoir at the reservoir's front face. Water is used as the working fluid in the tongue and reservoir. Solar radiation is incident on the front face of the tongue, which also loses heat to the outside, while radiation and convection transport heat from the back of the reservoir to the building. Convection transports heat when the tongue is irradiated; however, when convection ceases and the temperature of the tongue cools below that of the reservoir (from exposure to the outside temperature), the reservoir stratifies, and the primary heat loss mechanism is conduction through the tongue and its fluid. The result is a passive solar component that may outperform most others. Flow in the tongue is treated as boundary layer flow; the integral forms of the governing equations are combined to form a single equation governing the local boundary layer thickness. The results are shown to depend upon the Grashof, Prandtl, and heat-loss Biot numbers. Results from this model agree well with those from our flow visualization experiments. A model is also proposed for diode heat transport processes during cool-down. In this model, and empirical coefficient accounts for the weak convective mixing that occurs in the reservoir during this phase. Preliminary results indicate the coefficient to be spatially dependent but independent of time and reservoir temperature. More experiments are planned to further validate both of the models described above.

32940 **(NP—4770327) Contribution to the optimum design of a solar heating system for a residential building.** Arafa, A. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Thermodynamik und Waermetechnik). 29 Jun 1982. 132p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84770327.

Portions are illegible in microfiche products.

A model is presented for the simulation of the temporal behaviour of a building equipped with a solar heating system. This model serves to minimise the heat demand by varying several parameters, so as to be able to make an optimised design of a solar heating system. The calculations take into consideration: a three-dimensional temperature field in a flat plate collector, a temperature stratification in the storage tank and the thermal capacity of house walls.

32941 **(PB—84-163682) Solar heating plant for hot running water.** Andreasson, B.; Lagerkvist, K. (Statens Provningsanstalt, Boraes (Sweden)). 1 Dec 1982. 53p. (In Swedish). (SP-RAPP—1983-14). NTIS, PC E04/MF E01.

The project consisted of measuring and evaluation of two solar heating plants for hot running water, one located in Olsfors about one mile southwest of Boras and the other in Vargarda about 5 miles northwest of Boras. Both plants were made in accordance with SBN-75 and other applicable regulations and directives, and were financed entirely with the help of state loans. The plant at Olsfors is owned by the organization Bollebygds Hyresbostader and serves 28 apartments. The apartments have direct operating electric heaters for heating while the hot running water is distributed via conduit from an apparatus room situated in the area's garage structure. The solar heating plant consists of a 108 sq m solar collector

mounted on the roof of the garage and a storage tank with a volume of about 6 cu m placed in the apparatus room. Besides the solar heating system, hot water is heated by an electric heater. The report contains photographs of the plants, schematics, layout diagrams and graphs of measurement results. An analysis of the financing compares the costs of the two plants and their output with the cost of comparable purchased energy.

32942 **(PB—84-173632) Alternate energy sources for ConnDOT's (Connecticut Department of Transportation) materials testing laboratory: feasibility study.** Ganung, G.A. (Connecticut Dept. of Transportation, Wethersfield (USA)). Feb 1983. 41p. NTIS, PC A03/MF A01.

Based on an energy audit of the ConnDOT Rocky Hill Laboratory building, a number of alternate energy sources were investigated, including wind power, photovoltaic energy, heat pumps and solar heating and cooling. Existing alternate energy installations within the State were discussed. Preliminary designs of active and passive solar heating systems were made, and life cycle cost analyses performed. It was determined that, chiefly due to low average wind velocities, wind energy conversion systems were very poor in cost effectiveness. Photovoltaics and heat pumps were also poor. Both active and passive solar heating systems broke even within the 20 year payback period. Design data and life cycle cost analysis tables are included in this report. Although the passive system was approximately equal in cost effectiveness to the active, it was considerably less complex, and further study of the passive system was recommended.

32943 **(PB—84-179266) Passive solar-heating retrofit of a maintenance facility: final report. Research report Mar 81-May 83.** Jackson, D.R.; Callahan, J.M. (Connecticut Dept. of Transportation, Wethersfield (USA). Bureau of Planning and Research). Sep 1983. 48p. (R—724-F-83-16). NTIS, PC A03/MF A01.

See also PB83-171009.

This report presents the energy consumption characteristics of a 12,000 sf maintenance facility in Connecticut retrofitted with a 1,500 sf passive-solar Trombe wall, 2-1/2 in. of foam roof insulation and a new control system that allows night/weekend temperature setback. An energy-consumption monitoring system was installed in January 1980 and collected data for one and a half years before the retrofit and two years after the retrofit. Actual energy consumption was very close to that predicted using simple analytical methods. Average oil consumption for the period 1973 to 1980 was 8206 gal/yr. After the solar wall was installed and other energy-conservation measures implemented yearly oil consumption dropped to 2744 gal. and 2120 gal. for the 81/82 and 82/83 heating seasons, respectively.

32944 **(SAND—84-1042C) Testing of modular industrial solar retrofit industrial process steam systems.** Cameron, C.P.; Dudley, V.E. (Sandia National Labs., Albuquerque, NM (USA); EG and G/Washington Analytical Services Center, Inc., Albuquerque, NM (USA)). 13 Jun 1984. Contract AC04-76DP00789. 11p. (CONF-8406111—2). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012552.

From International Energy Agency workshop on the design and performance of large solar thermal collectors; San Diego, CA, USA (11 Jun 1984).

Portions are illegible in microfiche products.

Under the Department of Energy's Modular Industrial Solar Retrofit project, five industrial process heat systems incorporating line-focus solar collectors were designed and hardware was installed and tested at Sandia National Laboratories and the Solar Energy Research Institute. System designers and collector manufacturers participating in the project included Acurex Solar Corporation, BDM, Inc., Custom Engineering, Inc., Foster Wheeler Solar Development Corporation, Solar Kinetics, Inc., and Suntec Systems, Inc. This paper describes the testing of the qualification test systems which has been under way since mid-1982. Each qualification test system includes an equipment skid sufficient to support a collector field of 2300 m^2 aperture and one delta-tempeature string of from 175 to 460 m^2 aperture. Each system is capable of producing saturated steam at 1.7 MPa and operates at maximum outlet temperatures of from 250 to 290°C. The test series includes function and safety tests to determine that the systems operate as specified, an unattended operation test of at least two weeks duration, performance tests to allow prediction of annual system performance, and life cycle tests to evaluate component lifetime and maintenance requirements. Since the start of testing, some twenty five modifications have been made to the various systems for the purpose of improving system performance and/or reliability, and appropriate tests of these modifictions have been made or are underway. This paper presents a description of the approach to testing of the MISR systems and selected test results.

32945 **Passive solar construction handbook.** Levy, M.E. Emmaus, PA; Rodale Press (1983). 335p. (DOE/CE/30748—T1). Rodale Press, Emmaus, PA $29.95. Order Number TI84014092. Contract FG02-82CE30748.

The Passive Solar Construction Handbook provides a reference for adapting standard building methods and materials to passive solar applications. The core of the Handbook is a collection of hundreds of illustrated and labeled details and construction notes for the essential passive solar systems that singly or in combination form the basis of every passive solar building. These systems - direct gain, thermal storage wall, attached sunspace, and convective loop - are broken down for more detailed discussion into the major components in each system: collector, absorber, storage, distribution, and control. Accompanying case studies show how many of these details have been integrated into existing passive solar houses throughout the United States. Extensive cross-referencing leads readers through all appropriate detail options and to specific passive solar materials that are most suitable for each solar application. Specifications and thermal performance information on materials listed aid in final material selection. Introductory sections include passive solar design basics and rules of thumb, an energy-use analysis for choosing and sizing collection systems and components, and an economic analysis for evaluating alternative investment strategies. The appendix contains valuable energy information in chart and table format on the energy performance of specific construction materials. The Load Collector Ratio presented here is a fast technique for estimating the efficiency of an initial design and fine tuning it during the entire design process. The last section of the appendix contains information concerning the availability and uses of common solar analysis tools: computer software, manual programs, models, and handbooks. A glossary of important terms and a bibliography complete the book.

32946 **Five solar-energy desalination systems.** Luft, W. (Solar Energy Research Inst., Golden, CO). *International Journal of Solar Energy;* **1**: No. 1, 21-32(1982).

The cost for desalted water produced by solar energy-powered plants of small capacity, (6000 m^3/day), is at least twice as costly as desalted water produced by conventional plants of comparable size. Five systems for desalting water are described. These are: the Boeing System, the Catalytic System, the Chicago Bridge and Iron System, the DHR System, and the Exxon System. It was found that the total collected energy at system availability per unit product water (kWh/m^3) was lower for the Catalytic System than for any of the others.

32947 **(DOE/CS/83104—T1) Selective solar absorptance of some oxide and sulfide films grown in-situ on binary metal alloys. Final report.** Douglass, D.L.; Wu, M.Z. (California Univ., Los Angeles (USA). School of Engineering and Applied Science). Sep 1982. Contract FG02-80CS83104. 83p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84012775.

Portions are illegible in microfiche products.

A wide variety of iron-base, nickel-base, and copper-base alloys were subjected to oxidation, sulfidation, and oxidation-sulfidation treatments to form thin surface films with selective optical properties. Films were analyzed by X-ray diffraction, scanning electron microscopy, metallography, and X-ray dispersive energy analysis. Absorptances were determined in both the solar and infrared regions. Oxide films formed on iron alloys had high absorptances,

but the emittances were too high to be of practical interest. Both nickel-base and copper-base alloys formed films which gave interesting combinations of absorptance and emittance. Nickel alloys formed films which had much lower emittances than films on pure nickel for any thickness, although emittance increased with film thickness. Copper alloys formed films having very low emittances and which gave high values (13-16) for the ratio of absorptance to emittance. Sulfidation of the alloys showed that Ni_3S_2 was a poor selective absorber, but Cu_2S had excellent properties. Films containing both sulfides and oxides had excellent selective solar properties, depending upon the phases formed and their relative amounts. The good properties were attributed to either the composite or layer effects. Interpretation of the properties on the basis of band-gap energies was unsuccessful, although the defect structures of the various oxides suggest that oxidation of alloys, allowing incorporation of impurities into the oxide, increased the vacancy concentration and introduced new energy levels.

32948 **(DOE/EIA—0174(83)) Solar collector manufacturing activity 1983.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). Jun 1984. 56p. NTIS, PC A04/MF A01; 1 - GPO; GPO Dep. Order Number DE84013067.

Portions are illegible in microfiche products.

This report presents producer shipments and end-use data from manufacturers of solar thermal collectors and photovoltaic modules. It provides annual data necessary for the Department of Energy to execute its responsibility for (1) monitoring activities and trends in the solar collector manufacturing industry, and (2) providing information on the size and status of the industry to interested groups. These groups include the Solar Energy Research Institute, solar energy specialists, and manufacturers. 3 figures, 13 tables.

32949 **(PB—84-162056) Comparison of collector performance measured in a solar simulator. Final report.** Hettinger, H. (Commission of the European Communities, Luxembourg). 1983. 19p. (EUR—8347-EN). NTIS, PC E03/MF E03.

A study of the efficiency of a solar collector demands that tests are made under both steady state and repeatable operating conditions. This is achieved through the use of a light simulator in a climatic chamber. 38 solar collectors from 13 different manufacturers were examined at the JRC Ispra Establishment (Italy), using the solar simulator LS-1.

32950 **(PB—84-165299) Solar collector test procedures: development of a method to refer measured efficiencies to standardized test conditions. Final report 1977-80.** Thomas, W.C. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA). Dept. of Mechanical Engineering). Feb 1984. 150p. (VPI-E—80-23). NTIS, PC A07/MF A01.

An analytical procedure has been developed for referring collector efficiency measurements, obtained under different test conditions, to a common, or 'standard' set of conditions. The procedure applies to flat-plate liquid-type collectors of conventional tube-in-sheet design. The basic Hottel-Whillier-Bliss theory is used with appropriate extensions to account for serpentine flow configurations and glazing materials with high infrared transmittance. The procedure includes a systematic method for deriving two invariant collector parameters directly from ASHRAE Standard 93-77 test results. The two parameters selected are the plate absorptance and back loss coefficient. A set of standard conditions is recommended which corresponds to favorable test conditions.

32951 **Tracking system for solar collectors.** Butler, B.L. (to US Dept. of Energy). US Patent 4,425,904. 17 Jan 1984. Filed date 1 Oct 1980. vp.

PAT-APPL-192799.

A tracking system is provided for pivotally mounted spaced-apart solar collectors. A pair of cables is connected to spaced-apart portions of each collector, and a driver displaces the cables, thereby causing the collectors to pivot about their mounting, so as to assume the desired orientation. The collectors may be of the cylindrical type as well as the flat-plate type. Rigid spar-like linkages may be substituted for the cables. Releasable attachments of the cables to the collectors is also described, as is a fine tuning mechanism for precisely aligning each individual collector.

1420 Heat Storage

REFER ALSO TO CITATION(S) 32888, 32932

32952 **(FRNC-TH—1353) Experimental and theoretical comparison of a water storage system and of a phase-change material storage system on the experimental solar building of Bourgoin-Jallieu (Isere).** Aubert-Dasse, C. (Institut National Polytechnique, 38 - Grenoble (France)). Jun 1981. 104p. (In French). NTIS (US Sales Only), PC A06. Order Number DE84751739.

Paper copy only, copy does not permit microfiche production.

The aim of this study is to compare on a actual solar building and with a same equipment, the qualities of a water storage system and a phase-change storage system. First, the design of the experiment is present: choice of the material for heat storage, design of the exchanger, realization of the exchanger-storage tank unit and acquisition of the measuring equipment, and operation. Then a computerized simulation of the heat transfers is presented, and the model is adjusted in relation to the actual phenomena. Finally, the experiment results are given, and the influence of some parameters on the system efficiency is studied.

32953 **(LBL—14957) Heat storage in unsaturated soils: initial theoretical analysis of storage design and operational methods.** Doughty, C.; Nir, A.; Tsang, C.F.; Bodvarsson, G.S. (Lawrence Berkeley Lab., CA (USA); Ben-Gurion Univ. of the Negev, Sede Boqer (Israel). Desert Research Inst.). Jun 1983. Contract AC03-76SF00098. 8p. (CONF-830670—4). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013393.

From International conference on subsurface heat storage in theory and practice; Stockholm, Sweden (6 Jun 1983).

Portions are illegible in microfiche products.

Unsaturated soil beneath a greenhouse serves as a seasonal storage medium for low temperature heat obtained from solar collectors. The storage configuration consists of an array of vertical helical storage ducts. The computer code PT, developed at Lawrence Berkeley Laboratory, calculates the axisymmetric temperature distribution for a single duct system. Presently heat transfer in the soil is considered to be purely by conduction, but the effect of unsaturated flow will be included in future work. The results of these calculations will guide the construction of an optimal storage system currently being planned.

15 GEOTHERMAL ENERGY

32954 **(PB—84-174481) Development of a geopressured energy management information and analysis system in support of research planning: third year. Annual report Oct 82-Sep 83.** Wrighton, F.M.; Veal, L.K. (Louisiana State Univ., Baton Rouge (USA). Center for Energy Studies). Mar 1984. 66p. NTIS, PC A04/MF A01.

See also PB83-232769.

This annual report presents activities during the third year of research on unconventional gas resources. Geopressured and hydropressured (normally pressured) aquifers containing mobile gas in thin stringers, immobile gas, and gas in solution are known to occur in the Gulf Coast areas of Louisiana and Texas. LSU's role in the development of this resource was to design and implement an energy management information and analysis system to support research planning for the co-production of gas and water concept. This basic research supports GRI's goal of stimulating the commercialization of gas recovery in the near-term. This study has also developed a data base and information system on the problems and potential of unconventional gas resource options in the Gulf Coast and the assessment of each option's potential and remaining problems. During this reporting period, operator cooperation, numeric and analytical simulation techniques, and an improved method of estimating relative permeability were the emphases of research. An assessment of the co-production of gas and water illustrating the technically recoverable gas-in-place in major producing regions of the United States and an evaluation of possible gas production from a hydropressured aquifer were significant studies conducted with

the cooperation of GRI co-production contractors and consultants. Relevant technical information planning was implemented for incorporation into the information system.

1501 Resource Status And Assessment

REFER ALSO TO CITATION(S) 32967

1502 Geology And Hydrology Of Geothermal Systems

REFER ALSO TO CITATION(S) 32957, 32961

32955 **(DOE/ID/12026—T5) Thermopolis hydrothermal system with an analysis of Hot Springs State Park.** Hinckley, B.S.; Heasler, H.P.; King, J.K. (Wyoming Univ., Laramie (USA). Dept. of Geology and Geophysics). 1982. Contract FC07-79ID12026. 46p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012701.

Portions are illegible in microfiche products. Original copy available until stock is exhausted; Preliminary report No. 20.

Thermopolis is the site of Hot Springs State Park, where numerous hot springs produce nearly 3000 gallons per minute (gpm) of 130°F (54°C) water. The University of Wyoming Geothermal Resource Assessment Group has studied a 1700-square-mile area centered roughly on the State Park. Available literature, bottomhole temperatures from over 400 oil well logs, 62 oil field drill stem tests, the Wyoming State Engineer's water well files, 60 formation water analyses, thermal logs of 19 holes, and field investigations of geology and hydrology form the basis of this report.

32956 **(DOE/ID/12057—T8) Integration of geothermal data along the Balcones/Ouachita trend, central Texas. Final report.** Woodruff, C.M. Jr.; Gever, C. (Texas Univ., Austin (USA). Bureau of Economic Geology). 1983. Contract AS07-79ID12057. 173p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84013412.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report presents data that address possible controls on warm-water resources. Data are presented on a series of maps, and interpretations appear in the brief text accompanying the maps. It is thought that structural controls provided by the Balcones Fault Zone on the west and by the Luling-Mexia-Talco Fault Zone on the east localize the warm waters. The ultimate controlling attribute is the foundered Ouachita structural belt, which, in turn, has controlled the orientation and magnitude of displacement of the superjacent normal fault systems. This thesis is supported by maps (in pocket) showing the following: distribution of thermal waters measured in wells along the Balcones/Ouachita structural trend showing water temperature in °F, total depth of the well measured, water salinity in parts per million, and the geologic formation producing the water; structural contours on the base of the Cretaceous System showing the configuration of the Paleozoic Ouachita basement; structural configuration of the Balcones and Luling Fault Zone, Mexia and Talco Fault Zone, and foreland areas adjacent to the Ouachita Orogen using data from the Buda Limestone, Sligo Formation, and Ellenburger Group; Landsat lineaments and Bouguer gravity contours; and geothermal gradient contours of the Balcones/Ouachita trend based on thermal values from Paleozoic and selected Mesozoic formations.

1503 Geothermal Exploration And Exploration Technology

REFER ALSO TO CITATION(S) 32955, 32966

32957 **(EUR—8583-EN) High and low enthalpy geothermal resources exploration: Models, strategies and reality.** Sommaruga, C. (Commission of the European Communities, Luxembourg. Directorate-General for Information, Market and Innovation). 1983. 80p. Commission of the European Communities, Luxembourg.

This is a review of the main results of both the R and D and the demonstration projects which are at a more advanced stage - supported by the CEC (Dir. Gen. XII and XVIII of the Commission of the European Communities) since 1 July, 1975. These projects have concentrated on selected test areas, namely the Rhine Graben (Rhine Rift Valley), Massif Central, Naples region, etc. For their implementation is has been necessary to develop suitable prospecting and study technologies and to integrate the various methods of investigation. Also, in the light of the results obtained, we have attempted to provide the projects with defined exploration targets for which we have tried to assess the real prospects. In particular, some geological environments of differing geothermal interest have been identified; these are: crystalline massifs, intracratonic basins, foredeep basins, marginal basins, continental rifts, fissural basic volcanism, anatectic magmatism and central volcanoes with highly evolved products.

32958 **(EUR—8605-EN) Nisyros-1: geothermal well.** Merla, A. (Commission of the European Communities, Luxembourg). 1983. 240p. NTIS, PC E10/MF E10.

The drilling of Nisyros-1 well was decided by PPC late in 1981 on the basis of results of previous extensive exploration. All the geological, geochemical, and engineering data collected during the drilling and during preliminary production testing and fluid sampling are presented. The drilling of the Nisyros-1 deep exploratory well confirmed the dependable geothermal potential of this island.

32959 **(EUR—8790) Temperature and pressure measurement in high enthalpy geothermal wells, possibilities for optical fiber application, prefeasibility study.** Gueguen, F. (Commission of the European Communities, Luxembourg). 1983. 85p. (In French). Commission of the European Communities, Luxembourg. Order Number TI84751738.

The properties of optical fibers are briefly recalled, then the feability study of a transmission system by optical fibers with optical sensors is examined. The measurement system proposed comprises a transmission system with optical fibers of length equal to the well and a pressure and/or temperature sensor with optical fibers. The sensor, electrically passive, is optically interposed between the source and the detector which are both at the surface. Intensity modulators are chosen, rather than interferometers for better sensitivity and with a signal to noise ratio allowing a fairly wide measuring range. The signal emitted by the source is modulated by the sensor which should be as sensitive as possible to pressure or temperature but the transmission system should be insensitive to environment and optical fibers are chosen accordingly and optimized for attenuation and spatial resolution. In conclusion materials should be developed for a better thermal resistance.

32960 **(LA—10067-MS) Well log interpretation of certain geothermal fields in the Imperial Valley, California.** Ershaghi, I.; Abdassah, D. (Los Alamos National Lab., NM (USA)). Mar 1984. Contract W-7405-ENG-36. 27p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013853.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This study reviews the wireline log responses of some geothermal fields in the Imperial Valley, California. The fields under study include the Heber, the East Mesa, the Brawley, and the Westmoreland. The well logs used in the study did not include all the wireline surveys obtained by the operators. The selected well logs obtained under special arrangements with the operators were chosen to maintain the anonymity of specific well locations but are only representative of each area. Analysis of the well logs indicates that on an individual field basis, the well logs are excellent for correlation purposes. The presence of extremely saline fluids in some fields precludes the monitoring of Q/sub v/ (cation exchange capacity per unit volume) profile for detection of hydrothermally altered zones. The producing sections in all the fields are characterized by low porosity and high resistivity.

32961 (LA—10105-OBES) Low-temperature geothermal potential of the Ojo Caliente warm springs area, northern New Mexico. Vuataz, F.D.; Stix, J.; Goff, F.; Pearson, C.F. (Los Alamos National Lab., NM (USA)). May 1984. Contract W-7405-ENG-36. 60p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013857.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A detailed geochemical investigation of 17 waters (thermal and cold, mineralized and dilute) was performed in the Ojo Caliente-La Madera area. Two types of thermomineral waters have separate and distinctive geologic, geochemical, and geothermal characteristics. The water from Ojo Caliente Resort emerges with temperatures ≦ 54°C from a Precambrian metarhyolite. Its chemistry, typically Na-HCO_3, has a total mineralization of 3600 mg/l. Isotopic studies have shown that the thermal water emerges from the springs and a hot well without significant mixing with the cold shallow aquifer of the valley alluvium. However, the cold aquifer adjacent to the resort does contain varying amounts of thermal water that originates from the warm spring system. Geothermometry calculations indicate that the thermal water may be as hot as 85°C at depth before its ascent toward surface. Thermodynamic computations on the reaction states of numerous mineral phases suggest that the thermal water will not cause major scaling problems if the hot water is utilized for direct-use geothermal applications. By means of a network of very shallow holes, temperature and electrical conductivity anomalies have been found elsewhere in the valley around Ojo Caliente, and resistivity soundings have confirmed the presence of a plume of thermal water entering the shallow aquifer. The group of lukewarm springs around La Madera, with temperatures ≦ 29°C, chemical type of NaCaMg-HCO_3Cl and with a total mineralization ≦ 1500 mg/l behaves as a different system without any apparent relation to the Ojo Caliente system. Its temperature at depth is not believed to exceed 35 to 40°C.

32962 (LA-UR—84-1639) Logging technology for high-temperature geothermal boreholes. Dennis, B.R. (Los Alamos National Lab., NM (USA)). May 1984. Contract W-7405-ENG-36. 10p. (CONF-840572—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012452.

From International symposium on observation of the continental crust through drilling; Tarrytown, NY, USA (20 May 1984).

Research in materials, equipment, and instrument development was required in the Hot Dry Rock Energy Extraction Demonstration at Fenton Hill located in northern New Mexico. Results of this extensive development advanced the logging technology in geothermal boreholes to present state-of-the art. The new Phase II Energy Extraction System at the Fenton Hill Test Site will consist of two wellbores drilled to a depth of about 4570 m (15,000 ft) and then connected by a series of hydraulic-induced fractures. The first borehole (EE-2) was completed in May of 1980 at a depth of 4633 m (15,200 ft) of which approximately 3960 m (13,000 ft) is in Precambrian granitic rock. Starting at a depth of approximately 2930 m (9600 ft), the borehole was inclined up to 35° from vertical. Bottom-hole temperature in EE-2 is 320°C. The EE-3 borehole was then drilled to a depth of 4236 m (13,900 ft). Its inclined part is positioned directly over the EE-2 wellbore with a vertical separation of about 450 m (1500 ft) between them. Many of the geophysical measurements needed to develop the hot dry rock concept are unique. Most of the routine instruments used in petroleum drilling fail in the hot and abrasive environment. New equipment developed includes not only the downhole sonde that houses the transducer and associated line driving electronics, but modifications also were needed on the entire data retrieval systems and associated data analysis technology. Successful performance of wellbore surveys in the EE-2 and EE-3 boreholes depended upon the capacity of the sensors, instrument sonde, cablehead, and armored logging cable to work in this severe environment. The major areas of materials development for surveying the boreholes in the high-temperature environment were on elastomeric seals, electrical insulation for logging cables, downhole sensors, and associated downhole electronic and electro-mechanical components.

32963 (LBL—17644) Long-term dipole-dipole resistivity monitoring at the Cerro Prieto geothermal field. Wilt, M.; Goldstein, N.E.; Sasaki, Y. (Lawrence Berkeley Lab., CA (USA); Kyushu Univ., Fukuoka (Japan). Faculty of Engineering). Apr 1984. Contract AC03-76SF00098. 9p. (CONF-840809—13). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012251.

From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Portions are illegible in microfiche products.

Dipole-dipole resistivity measurements for the combined purposes of reservoir delineation and reservoir monitoring were first made at Cerro Prieto in 1978 and have continued on approximately an annual basis since then. Two 20 km-long dipole-dipole lines with permanently emplaced electrodes at 1-km spacings were established over the field area. Resistivity remeasurements have been made on one line at 6- to 18-month intervals using a 25 kW generator capable of up to 80A output and a microprocessor-controlled signal-averaging receiver. This high-power, low-noise system provides highly accurate measurements even at large transmitter receiver separations. Standard error calculations for collected data indicate errors less than 5% for all points. Results from four years of monitoring (1979-1983) indicate a 5% average annual increase in apparent resistivity over the present production area, and larger decreases in apparent resistivity in the region to the east. The increase in resistivity in the production zone is most likely due to dilution of reservoir fluids with fresher water, as evidenced by a drop in chloride content of produced waters. The area of decreasing resistivity east of the reservoir is associated with a steeply dipping conductive body, a zone of higher thermal gradients and an increase in shale thickness in the section. Decreasing resistivity in this area may be caused by an influx of high temperature, saline water from depths of 3^+ km through a sandy gap in the shales.

32964 (SAND—84-0756C) Feasibility of a borehole VHF radar technique for fracture mapping. Chang, H.T. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 5p. (CONF-840809—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84009920.

From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Experiments were conducted to establish the feasibility of a downhole high-frequency electromagnetic technique for location of fractures in the vicinity of boreholes. An existing flame-cut slot in granite was filled with salt water to simulate a brine-filled fracture. A transmitter consisting of a phased dual-dipole array arranged to provide a directional signal toward the fracture was installed in a borehole opposite the fracture. A receiver operated at 30 to 300 MHz was also located in the same borehole. The radar returns from the simulated fracture were detectable in boreholes located at distances of up to 12 meters from the fracture. These results indicate for the first time the feasibility of a downhole VHF radar for use in a single borehole for detection of fractures located away from the borehole.

32965 (DOE/SF/11664—T3) Direct chlorination process for geothermal power plant off-gas - hydrogen sulfide abatement. Sims, A.V. (Sheinbaum (I.) Co., Inc., Monrovia, CA (USA)). Jun 1983. Contract AC03-82SF11664. 59p. NTIS, PC A; 3; GPO Dep. Order Number DE84011396.

Paper copy only, copy does not permit microfiche production. Original copy available until stock is exhausted.

The Direct Chlorination Process removes hydrogen sulfide from geothermal off-gases by reacting hydrogen sulfide with chlorine in the gas phase. Hydrogen chloride and elemental sulfur are formed by this reaction. The Direct Chlorination Process has been successfully demonstrated by an on-site operation of a pilot plant at the 3 M We HPG-A geothermal power plant in the Puna District

on the island of Hawaii. Over 99.5 percent hydrogen sulfide removal was achieved in a single reaction state. Chlorine gas did not escape the pilot plant, even when 90 percent excess chlorine gas was used. A preliminary economic evaluation of the Direct Chlorination Process indicates that it is very competitive with the Stretford Process. Compared to the Stretford Process, the Direct Chlorination Process requires about one-third the initial capital investment and about one-fourth the net daily expenditure.

32966 **(PB—84-173665) Survey of environmental regulations applying to geothermal exploration, development, and use. Final report.** Beeland, G.V. (Wapora, Inc., Washington, DC (USA)). Mar 1984. 251p. NTIS, PC A12/MF A01.

See also PB-281023.

Federal, State, and local environmental laws and regulations that apply to geothermal energy development are summarized. Most attention is given to those regulations which deal with air pollution, water pollution, solid wastes and impact assessments. Analyses are made of the regulations with respect to resource definition, pollutants currently not controlled, duplicity and overlap in permit and impact assessment requirements, the lack of uniformity of regulations between states, and the probable future approaches to the regulatory problems. This project updates a similar document (EPA/600/7-78-014) dated February 1978.

32967 **(DOE/ET/27196—T17) Water for goethermal development in Imperial County. A summarizing report.** (Imperial, County of, El Centro, CA (USA). Dept. of Public Works). Jan 1984. Contract FC03-79ET27196. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013636.

Portions are illegible in microfiche products.

Information on water issues related to geothermal development is reviewed, including research on local water resources and quality, cooling water requirements for geothermal power plants, and water for geothermal development. Topics of on-going research are noted and questions for future research are posed.

32968 **(DOE/ET/27252—T1) Open loop pneumatic control of a Lysholm engine or turbine exhaust pressure.** Plonski, B.A. (California Univ., Berkeley (USA). Dept. of Mechanical Engineering). 17 Jul 1981. Contract AT03-80ET27252. 104p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013595.

Portions are illegible in microfiche products; thesis.

A Lysholm engine, or helical screw expander, is currently being evaluated at the University of California, Berkeley for staging with a conventional turbine in geothermal energy conversion. A pneumatic closed loop, proportional-integral control system was implemented to control the Lysholm engine's exhaust pressure for performance testing of the engine at constant inlet/outlet pressure ratios. The control system will also be used to control the exhaust pressure of the conventional turbine during future testing of the staged Lysholm-turbine system. Analytical modeling of the control system was performed and successful tuning was achieved by applying Ziegler-Nichol's tuning method. Stable control and quick response, of approximately 1 minute, was demonstrated for load and set point changes in desired exhaust pressures.

32969 **(DOE/ET/27252—T2) Hybrid staging of a Lysholm positive displacement engine with two Westinghouse two stage impulse Curtis turbines.** Parker, D.A. (California Univ., Berkeley (USA). Coll. of Engineering). Jun 1982. Contract AT03-80ET27252. 68p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013693.

Portions are illegible in microfiche products; Thesis.

The University of California at Berkeley has tested and modeled satisfactorly a hybrid staged Lysholm engine (positive displacement) with a two stage Curtis wheel turbine. The system operates in a stable manner over its operating range (0/1-3/1 water ratio, 120 psia input). Proposals are made for controlling interstage pressure with a partial admission turbine and volume expansion to control mass flow and pressure ratio for the Lysholm engine.

32970 **(DOE/ET/27252—T3) Altering the volumetric expansion ratio of a Lysholm helical screw expander.** Dunbar, M.K. (California Univ., Berkeley (USA). Coll. of Engineering). 1984. Contract AT03-80ET27252. 89p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013695.

Portions are illegible in microfiche products; Thesis.

This is an analysis of the effects of the volumetric expansion ratio on the operation of a Lysholm helical screw expander. Extensive testing of the University of California Lysholm engine with a 5.3 volumetric expansion ratio was performed. In this experiment, the expansion ratio has been reduced from 5.3 to 4.0. Tests were performed at a variety of speeds and qualities for a 5.0 pressure ratio and at a variety of speeds and pressure ratios for 99 percent quality. It was predicted that decreasing the volumetric expansion ratio would decrease the leakage fraction and thereby increase efficiency. This occurred as predicted. Isentropic efficiency increased 20 percent for 50 percent quality steam and 16 percent for 33 percent quality steam, all for an inlet pressure of 120 psia and a speed of 9000 rpm. A maximum efficiency of 47.2 percent was reached at 33 percent quality, 9000 rpm and a pressure ratio of 5.0. It was noted that the leakage rate did not appear to be a function of expansion ratio, as had been expected. Using this fact the previous empirical models of the engine were extended to include volumetric expansion ratio as a variable parameter.

32971 **(DOE/ET/27252—T4) Comparison between two Lysholm engines.** Frau, B.A. (California Univ., Berkeley (USA). Coll. of Engineering). 1983. Contract AT03-80ET27252. 77p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013696.

Portions are illegible in microfiche products; Thesis.

The University of California at Berkeley (UCB) and the Jet Propulsion Laboratory (JPL) both have been working on the Lysholm engine as an expander of two phase geothermal brine. The sizes of the machines, (The machine at UCB is rated at 25 kW, and the machine that JPL tested is rated at 1MW) as well as the approaches, are different. Here, some comparisons are made in order to clarify the direction in which future efforts should be conducted.

32972 **(DOE/ET/27252—T5) Analysis and testing the performance of a centrifugal two phase flow separator.** Mirza-Moghadam, A.V. (California Univ., Berkeley (USA). Dept. of Mechanical Engineering). Win 1980. Contract AT03-80ET27252. 55p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013598.

Portions are illegible in microfiche products; thesis.

Analysis and testing the performance of an 8 in., 1.72 ft high centrifugal cyclone separator for flows up to 4.0 lbs/s and pressures ranging from 10 to 60 psig. Conclusions drawn are based on inlet steam qualities of 23 to 27 percent (x% = m/sub s//m /sub t/) .99% and better steam quality is achieved up to 3 lbs/s under 50 and 60 psig. Breakdown flow rate is found to be a linear function of separator pressure.

32973 **(DOE/ET/27252—T6) Performance characteristics of the Lysholm engine.** Berger, R.E. (California Univ., Berkeley (USA). Dept. of Mechanical Engineering). 1980. Contract AT03-80ET27252. 87p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013596.

Portions are illegible in microfiche products; thesis.

The performance of a 5 in. diameter rotor Lysholm engine prototype running on simulated geothermal flows from 16 to 100% quality is described. Staging was performed with conventional Westinghouse 25 kW steam turbines demonstrating that such a process is feasible. Maximum efficiency and power noted were 37.2% and 26.3 kW respectively, but inhibiting factors were discovered which, upon correction, should allow efficiencies around 50% and powers up to 35 kW. Larger engines with minor modifications should get better efficiencies. Data was taken for inlet pressures of 75 to 120 psia and speeds of 3000 to 9000 rpm's. Further testing under similar conditions is planned.

32974 **(DOE/ET/27252—T8) Empirical modeling of a Lysholm helical screw expander.** Brown, K.A. (California Univ., Berkeley (USA). Coll. of Engineering). 1984. Contract AT03-80ET27252. 145p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013694.

Portions are illegible in microfiche products; Thesis.

Testing of a Lysholm helical screw expander having a rotor diameter of 5.12 inches and an expansion ratio of 5.3 was performed with simulated geothermal fluid at an inlet pressure of 120 psia. The inlet quality, engine speed and pressure ratio were independently varied to produce a three-dimensional data matrix of 104 data points. Statistical curve fitting methods were adapted to produce equations for mass flow rate and power output in terms of the three variables associated with the data matrix. These explicit equations were combined with a steam table subroutine to produce a computer model for prediction of mass flow rate, power, efficiency and exhaust quality at a given set of operating conditions. The predictive ability observed during validation of the model is adequate for use in modeling of hybrid geothermal energy conversion systems. Mass flow rates werre predicted to within 2.7% of the measured values. For most conditions, predictions of power were within 3.3% of the measured values. Predictions of efficiency reflected the combined errors in prediction of power and mass flow rate. Efficiency predictions were in error by as much as 5% of the measured values. The predictions for exhaust quality were within 0.4% of the measured values. Isentropic engine efficiencies of over 43% were measured during the tests. An observed peak in efficiency represented an optimum pressure ratio and a trade-off between lower leakage fractions at high speeds and low inlet qualities, increasing frictional losses at high speeds, and increasing fluid and power densities at low qualities.

32975 **(EUR—8791-EN) Feasibility of electricity generation from medium enthalpy (100-200°C) geothermal sources.** Pempie, P.; Potiron, A.; Mauconduit, M.; Grossin, R. (Commission of the European Communities, Luxembourg. Directorate-General for Information, Market and Innovation). 1983. 185p. Commission of the European Communities, Luxembourg.

This report addresses the technical and economical feasibility of electric power generation from medium to high enthalpy geothermal sources which represent a wide range of resources, many of them unexploited to date. Depending on the conditions prevailing locally - temperatures, pressures, steam or/and brine flow rates, cold source - a suitable cycle and production system will be selected. The report reviews existing and non conventional conversion cycles, processes and engines. Emphasis is placed on calculation of cycle, system and economic efficiencies of the candidate cycles for extracting energy from medium enthalpy geothermal brines.

32976 **(DOE/ET/27252—T7) Design, construction and evaluation of a simulated geothermal flow system.** Mackanic, J.C. (California Univ., Berkeley (USA). Dept. of Mechanical Engineering). 28 Jul 1980. Contract AT03-80ET27252. 82p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013597.

Portions are illegible in microfiche products; thesis.

A system was designed and built to simulate the flow from a geothermal well. The simulated flow will be used to power a Lysholm engine, the performance of which will then be evaluated for different simulated geothermal flows. Two main subjects are covered: 1) the design, construction and evaluation of the behavior of the system that simulates the geothermal flow; included in that topic is a discussion of the probable behavior of the Lysholm engine when it is put into operation, and 2) the investigation of the use of dynamic modeling techniques to determine whether they can provide a suitable means for predicting the behavior of the system.

32977 **(FRNC-TH—1363) Study of phase transformation phenomena by auto-evaporation in a porous medium.** Podaire, A. (Institut National Polytechnique, 31 - Toulouse (France)). Feb 1981. 133p. (In French). NTIS (US Sales Only), PC A07. Order Number DE84750800.

Paper copy only, copy does not permit microfiche production.

This study takes interest in the phenomena which arise in the course of the exploitation of "high energy" type geothermal deposits: aquifers of which temperature of waters is above 150°C (high geothermal gradient regions). The bringing in of such reservoirs may produce, in the vicinity of the well, two types of flow, of which existence depends on the thermodynamic conditions of the deposit and on the operating way: a liquid phase flow or a two-phase flow (liquid + vapor). This study is mainly devoted to develop numerical models allowing to get a local description of these phenomena. After a bibliographical synthesis, mainly focused on the simulations of the behavior of reservoirs, the study is devoted to: the presentation of the mathematical model from which the analysis of the phenomena will be done, the brief description of the experimental installation and the presentation of some results, the statement of the method of solution of the mathematical model of which representative character is qualitatively appraised, first of all comparatively to some experimental results and will be used, then to estimate the dependence to some parameters for the evolution of the phenomena.

32978 **(LA-UR—84-1106) Downhole seismic monitoring of an acid treatment in the Beowawe Geothermal Field.** Batra, R.; Albright, J.N.; Bradley, C. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 6p. (CONF-840809—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84010002.

From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Portions are illegible in microfiche products.

During the acid treatment of a subeconomic well at the Beowawe Geothermal Field, numerous seismic events were detected of which 22 could be located. The events occurred following a first stage of the acid treatment and generally define a trend paralleling the surface trace of the Malpais fault. No seismic signals were detected following a second stage of the acid treatment, despite the injection of almost twice as much additional fluid. It is postulated that the cause of seismic events following the first stage was due to shear failure of chemically weakened cemented fracturs or joints in the reservoir. Presumably reservoir strain was sufficiently reduced to preclude further rock failure during the second day of treatment.

32979 **(LA-UR—84-1193) Hydraulic fracturing and propping tests at Yakedake field in Japan.** Yamaguchi, Tsutomu; Seo, Kunio; Suga, Shoto; Itoh, Toshinobu; Kuriyagawa, Michio. From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Portions are illegible in microfiche products.

Hydraulic fracturing experiments have been conducted at Yakedake field in Gifu prefecture, Japan. From the data obtained during the fracturing operation, the open-hole section permeability was estimated of the wellbore, the minimum pressure required to propagate the fracture, the impedances before and after the propping, and the earth stress normal to the fracture plane. The final fracture plane was also mapped with the microseismic events.

32980 **(LA-UR—84-1900) Well simulation using Refrigerant 114.** Nikitopoulos, D.E.; Dickinson, D.A.; DiPippo, R.; Maeder, P.F. (Los Alamos National Lab., NM (USA); Brown Univ., Providence, RI (USA)). Jun 1984. Contract W-7405-ENG-36. 6p. (CONF-840809—16). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013906.

From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Portions are illegible in microfiche products.

A simple method for the investigation of thermodynamic (substance) similarity in the two-phase domain is introduced based on the assumptions of a simplified model fluid. According to this

method, the investigation of the conditions for thermodynamic similarity between substances in the two-phase region reveals the important role the latent heat of evaporation (h/sub fg/) plays in the definition of the property scales. These greatly influence the dynamic and geometric similarity of the process under investigation. The introduction of the thermodynamic similarity property scales into the energy conservation equations for a certain process (e.g., flow up a geothermal well) brings forth a thermodynamic length scale and kinetic energy scale. Refrigerant 114 has been examined for similarity with water substance according to this method and found to be adequate for geothermal well simulation in the laboratory. Low pressures and temperatures and a substantial reduction of mass flow rates and geometric scales are a few of the advantages of using R114 for such experiments.

32981 **(LBL—14511) Well test data analysis from a naturally fractured liquid-dominated hydrothermal system.** Benson, S.M. (Lawrence Berkeley Lab., CA (USA)). Oct 1982. Contract AC03-76SF00098. 7p. (CONF-821007—15). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013244.

From Annual geothermal resources council meeting; San Diego, CA, USA (11 Oct 1982).

Portions are illegible in microfiche products.

Production test data from a moderate-temperature geothermal well in the Basin and Range Province have been analyzed. The well is completed in granitic basement rock. Both the pressure transient and spinner data confirm that fractures provide the major component of the reservoir permeability. The productivity index of the well decreases and the apparent skin factor increases with increasing flow rate. This behavior is attributed to non-Darcy flow in the fractures near the well bore. A mathematical relation between flow rate and drawdown has been established that includes the non-Darcy and Darcy flow components.

32982 **(LBL—17694) Numerical studies of enthalpy and CO_2 transients in two-phase wells.** Bodvarsson, G.S. (Lawrence Berkeley Lab., CA (USA)). 1984. Contract AC03-76SF00098. 9p. (CONF-840809—15). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012252.

From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Portions are illegible in microfiche products.

Numerical studies of enthalpy and CO_2 transients for wells completed in composite reservoir systems are carried out. Both constant rate and constant pressure production are considered. The results show that relatively small variations in hydrologic parameters and vapor saturation can have large effects on the enthalpy and CO_2 content of the produced fluids. Field data are presented that illustrate the theoretical results obtained.

32983 **(PB—84-167410) Making the most of geothermal power.** Turtle, J. (Central Electricity Generating Board, Southampton (England). Technology Planning and Research Div.). 1982. 31p. (TB—466). NTIS, PC E04/MF E04.

Geothermal energy research is continually striving to obtain more electrical power from a given quantity of fluid extracted from the ground; In this note the contribution arising from optimisation of the heat exchanger differential temperatures is explored using a simple model; The contribution is shown to be significant. A recommendation is made that the impact of these differential temperatures should be evaluated on a more representative computer model to determine the optimum economic cost of geothermal electricity from the Hot-Dry-Rock resource in Cornwall. (Copyright (c) Central Electricity Generating Board 1982.)

32984 **(SAND—84-0314C) GEOGYN - a geological formation/drill string dynamics computer program.** Caskey, B. (Sandia National Labs., Albuquerque, NM (USA)). 16 Sep 1984. Contract AC04-76DP00789. 22p. (CONF-8409104—1). NTIS, PC AA02/MF A01; 1; GPO Dep. Order Number DE84013808.

From 59. annual Society of Petroleum Engineers of AIME technical conference; Houston, TX, USA (16 Sep 1984).

Portions are illegible in microfiche products.

This paper describes the initial development phase of a finite element computer program, GEODYN, capable of simulating the three-dimensional transient, dynamic response of a polycrystalline diamond compact (PDC) bit interacting with a non-uniform formation. The ability of GEODYN to simulate response variations attributable to hole size, hole bottom surface shapes, and formation material non-uniformities is demonstrated. Planned developmental phases will address the detailed response of a bottom-hole assembly (BHA), a drill ahead (rock penetration and removal) simulation, and ultimately, the response of the entire string.

32985 **(SAND—84-0757C) Thermal limitations on the use of PDC bits in geothermal drilling.** Glowka, D.A. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 7p. (CONF-840809—2). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84010269.

From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Portions are illegible in microfiche products.

Factors affecting the potential for using polycrystalline diamond compact (PDC) drill bits in geothermal drilling are discussed. Pertinent results from previous laboratory and field tests are reviewed. The two predominant failure mechanisms, abrasive cutter wear and catastrophic loss of cutters, are discussed. A temperature activated mechanism for accelerating cutter wear is identified, and the implications for hard-rock drilling are investigated. An upper bound on drillable rock strength without causing thermally-accelerated wear is established for a variety of operating and environmental conditions.

32986 **(SAND—84-0758C) Analyzing the dynamic behavior of downhole equipment during drilling.** Baird, J.A.; Caskey, B.C. (Jordan, Apostal, Ritter Associates, Inc., Davisville, RI (USA); Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 5p. (CONF-840809—5). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84008840.

From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Portions are illegible in microfiche products.

Advanced geothermal drilling systems will require a bottom hole assembly (BHA) which utilizes sophisticated electronic and mechanical equipment to accomplish faster, more trouble free, smarter drilling. The bit-drill string/formation interaction during drilling imposes complex, intermittent dynamic loading on the downhole equipment. A finite element computer code, GEODYN, is being developed to allow analysis of the structural response of the downhole equipment during drilling and to simulate the drilling phenomena (i.e. penetration, direction, etc.). Phase 1 GEODYN, completed early in 1984, provides the capability to model the dynamic response of a polycrystalline diamond compact (PDC) bit interacting with a non-homogeneous formation. Succeeding development phases will allow inclusion of stabilizers and, eventually, the entire drill string in addition to facilitating drill ahead simulation.

32987 **(SAND—84-0759C) Program to investigate the engineering feasibility of extracting energy from shallow magma bodies.** Carson, C.C.; Allen, A.D. (Sandia National Labs., Albuquerque, NM (USA); USDOE, Washington, DC). 1984. Contract AC04-76DP00789. 3p. (CONF-840809—4). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84008852.

From Geothermal Resources Council annual meeting; Reno, NV, USA (27 Aug 1984).

Portions are illegible in microfiche products.

A new program, sponsored by the Department of Energy's Geothermal and Hydropower Technologies Division, has begun to investigate the engineering feasibility of extracting energy from shallow magma bodies. This program follows a previous investigation of the scientific feasibility of using magma and differs from it in focus. The current program is directed toward determining whether magma energy can be extracted economically. In the first year of the program, the three most promising sites for a long term experiment will be characterized; the research and development tasks that will be required will be identified; and a program plan outlining the entire feasibility study will be compiled.

1510 Direct Energy Utilization

32988 **(DOE/ID/12137—T1) New Mexico State University Campus geothermal demonstration project.** Cuniff, R.A.; Fisher, K.P.; Chintawongvanich, P. (New Mexico State Univ., Las Cruces (USA). Physical Science Lab.). Apr 1984. Contract FC07-80ID12137. 278p. NTIS, PC A13/MF A01; 1; GPO Dep. Order Number DE84013698.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report presents the design, construction highlights, and performance of the New Mexico State University Campus Geothermal Demonstration Project at Las Cruces, New Mexico. Construction started in July 1981, first system use was January 1982, and the system was dedicated on April 21, 1982. Included herein are summary observations after two years of use. The geothermal hot water from New Mexico State University wells is used to heat potable water, which in turn provides 83 percent of the domestic hot water on the New Mexico State University campus, as well as space heat to two buildings, and for two heated swimming pools. The original system is providing service to 30 total buildings, with two additional buildings (150,000 square feet) in process of geothermal conversion.) The system overall performance has been excellent, except for geothermal well pump problems. In terms of operating efficiency, the system has exceeded the design parameters. In spite of abnormally high costs for well and pump repairs, the system has shown a positive cost avoidance of more than $118,000 for the first year of operation. For the first two full years of operation, the system has produced a net positive cost avoidance of more than $200,000. Payback on the total investment of $1,670,000 is projected to be 6 to 10 years, depending on the future prices of natural gas and electricity.

32989 **(EUR—8481-FR) Design and testing of a prototype forced-draft, low temperature fan convector.** Thellier, F. (Commission of the European Communities, Luxembourg). 1983. 70p. (In French). NTIS, PC E04/MF E04.

The main requirement for the design of a fan of a convector used in exploitation of a geothermal source was to meet a low noise level. At a turbine speed of 1,000 RPM, a flow rate of 150 sq m/h, and at low water inlet temperatures, the tests showed that the performance of the forced-draft convector was better than that of the natural draft convector. This means that the outlet temperature is lower for the forced draft convector, resulting in a higher heat release of the geothermal source. The advantages of this type of convector are: (a) possible use of low temperature geothermal brines (40 C), and (b) COP values are expected to be 80% higher when coupled to a multistage heat pump than with conventional convectors.

17 WIND ENERGY

32990 **(BEOP—24) IEA R and D program for Wind Energy Conversion Systems. Paper presented at the National Wind Energy Conference 1983.** Sens, P.F. (Stichting Energieonderzoek Centrum Nederland, Petten. Energie Studie Centrum). Nov 1983. 20p. (In Dutch). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84750915.

The IEA research and development program for wind energy conversion systems is surveyed (IEA-R and D-WECS). The original tasks were: study of environmental and meteorological aspects of WECS; evaluation of wind models for site selection; integration of wind power into the national electric power grid, and research on the loads on the rotor blades of large wind turbines. Later on these tasks were extended with: turbulence patterns behind solitary wind turbines and wind turbine parks; local patterns of air currents round a hill, situated in front of a WECS, and offshore WECS. Twelve countries are participating in this project. Large systems are under construction or already in operation to prove that wind is a usable source for large scale electric power generation. The original tasks of this project, mentioned above, are already completed and fully realized.

1703 Regulations

32991 **(DOE/CS/60014—3) Zoning for wind machines. A guide for Minnesota communities.** (Minnesota Dept. of Energy and Economic Development, St. Paul (USA). Energy Div.). Aug 1983. Contract FG45-76CS60014. 36p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84012315.

The purpose of the guide is to provide information on wind machines and related zoning issues to enable planners, zoning administrators, county commissioners, city councils, and other staff and elected officials to make informed decision on how small wind machines will be addressed in community plans and zoning ordinances. Recommendations and model language that could be adopted in a Minnesota community are included. Also considered are the goals and policies on wind machines that can be integrated into a comprehensive plan or other planning documents. Amendments to subdivision and planned unit development regulations to encourage the use of wind machines are also discussed. (LEW)

1704 Economics

32992 **(NP—4901132) Recommended practices for wind turbine testing. 2. Estimation of cost of energy from wind energy conversion systems. 1. Edition 1983.** Nitteberg, J. (ed.). (Institute for Energy Technology, Kjeller (Norway)). 1983. 23p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84901132.

A standard methodology for comparing the cost of energy produced by wind energy conversion systems (WECS) available in the market is provided. The method is not limited to electricity-producing WECS and is generally applicable to WECS of all sizes and classifications as well as power stations containing a group of WECS. The method of cost estimation adopted in the recommended procedure is based on the use of the so-called real interest rate, which in a way reflects the total cost during lifetime, taking into account the combined effect of interest and inflation. The method is based on the estimation of the actualized cost of future expenditure. The data required is supplied on the Standard Technology Questionnaire (STQ) which covers organizational, system, technical, and cost data. (LEW)

32993 **(SERI/TR—211-2318) Wind energy systems for electric utilities: a synthesis of value studies.** Flaim, T.; Hock, S. (Solar Energy Research Inst., Golden, CO (USA)). May 1984. Contract AC02-83CH10093. 110p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84004520.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Since 1975, a substantial amount of research has been completed related to the impact of wind energy conversion systems (WECS) on electric utilities. Eight major studies have estimated the value of wind systems - the amount the utility could afford to pay for wind turbines with no cost or reliability penalties. However, each of these studies was completed at different times, reflected different economic assumptions, and reported results in different base-year dollars. The result is that while these reports contain a substantial amount of useful information, their results are difficult to compare and interpret directly. This report describes briefly the basic value analysis methodology as it exists today, identifies unresolved issues, and normalizes and interprets the results from value analysis studies that have been completed since 1979.

1705 Environmental Aspects

32994 (NE/VIND—83-16) Birds and wind power. Technical report 1977-1982. Karlsson, J. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). Feb 1983. 181p. (In Swedish). NTIS (US Sales Only), PC A09/MF A01. Order Number DE84751013.

Portions are illegible in microfiche products.

The impact of wind power plants on birds has been studied. The risk of migrating birds colliding with high buildings has been investigated. Different hazards and accidents are described and reported in 12 appendices. Preliminary data from the sites of wind power plants are presented.

32995 (NE/VIND—83-17) Birds and wind power. Result report 1977-1982. Karlsson, J. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). Feb 1983. 14p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751012.

Portions are illegible in microfiche products.

Two large-scaled aerogenerators were erected in Sweden in 1980-82. Questions about how birds react on the generators were raised early. Theoretical calculations about the risk for collisions between migrating birds and the generators, together with data on the bird collision frequencies at radio- and television towers in Sweden were presented in a report in 1978. It was assumed that the collision frequency will normally not exceed five birds per night during nights with normal traffic rate of migrating birds, and with maximum of about 50 birds on special occasions (few cases per season). In 1979-1982 the local breeding bird fauna was censused in the immediate vicinities of the sites (arable land and grazed bushland) where the aerogenerators has been erected. The results obtained so far, do not indicate any effect at all on species diversity or abundance when comparing the situation before and after the erection of the arerogenerators. Some species have successfully colonized the areas, obviously exploiting resources created by the building activities. Two such species are Oenanthe oenanthe and Delichon urbica. Reactions of migrating birds when passing close to the generators will be studied in the nearest future (autumn 1983) when the plants will be in continous work.

1706 Wind Energy Engineering

Portions are illegible in microfiche products.

Wind speed and direction were measured for the period from April 1979 to February 1982. The wind sensors were mounted at the towers up to a maximum height of 46 m at six different sites in the northern German coastal area. The raw data were checked, converted to physical units and corrected if necessary. The data in final form are organized in a data bank with easy acess. The results for the measuring period were compared to long term geostrophic wind data and then matched. To interpolate horizontally and vertically analytical, statistical and numerical methods were applied. The wind data then served to compute the wind power potential and the energy yield of a wind energy converter (GROWIAN). The wind forecast accuracy and the spacing of wind energy converters were estimated in addition to the data evaluation.

32998 (ECN—83-181) Comparison of the calculations of the computer program WEPP with actual measurements of the 25 m HAT and Polenko WPS-16-A60. Curvers, A. (Stichting Energieonderzoek Centrum Nederland, Petten). Nov 1983. 16p. (In Dutch). ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

The computer program WEPP calculates, starting from a Cp-lambda characteristic and simple models for losses in gear-box and electric generator, a power characteristic which can be used for predicting performances of wind turbines. Results are compared with tests performed at two wind turbines located at the ECN test field.

32999 (ECN—141) On the systematic errors in the measurement of the aerodynamic performance of a WECS by the method of bins. Dragt, J.B. (Stichting Energieonderzoek Centrum Nederland, Petten). Nov 1983. 29p. NTIS (US Sales Only), PC A08/MF A01. Order Number DE84750912.

The systematic errors that may be obtained in determining the power (or torque) performance curve of a wind energy conversion system by the method of bins are discussed. Errors are due to lack of correlation of wind speeds, either in time due to dynamic effects (for which correction by measurement is possible), or in space (which can be allowed for by a computed correction). The way of measurement and analysis are discussed in some detail. A theory is given on how to calculate the systematic errors quantitatively. Recommendations are given for keeping the errors as small as possible. For the situation that errors can not be made negligible a method is developed to correct the performance curve, using only the experimental data. The alternative inverse method of bins is shown to produce errors in the opposite direction and to have some advantages under certain circumstances. The theory has been confirmed in a satisfactory way by experiments in a 15 m vertical axis wind turbine and a 25 m horizontal axis wind turbine.

33000 (Juel-Spez—203) Implementing agreement for cooperation in the development of large scale wind energy conversion systems. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Projektleitung Energieforschung). Apr 1983. 59p. (CONF-8205261—). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751418.

From 8. meeting of experts - safety assurance and quality control of LS WECS during assembly, erection and acceptance testing; Stockholm, Sweden (26 May 1982).

Portions are illegible in microfiche products.

From May 26-27 1982, the '8. meeting of experts - safety assurance and quality control of LS WECS during assembly, erection and acceptance testing' took place at Stockholm, organized by the Project Management for Energy Research (PLE) of the Nuclear Research Establishment Juelich (KFA). The 5 papers at this symposyum are concerned with problems of safety engineering and of quality assurance for wind power plants. Separate abstracts were prepared for each paper.

33001 (Juel-Spez—203, pp 1-7) Swedish prototype Naesudden. Svensson, G. Apr 1983. NTIS (US Sales Only), PC A04/MF A01. Order Number TI84751418. (CONF-8205261—).

From 8. meeting of experts - safety assurance and quality control of LS WECS during assembly, erection and acceptance testing; Stockholm, Sweden (26 May 1982).

Within the framework of the Swedish Wind Energy programme a large wind energy plant was erected at Naesudden on the Island of Gotland. Energy production is estimated to 6 GWh/year and the design life is 30 years. The constructional characteristics of the plant are described as well as the rotor blades, hub, tower and machinery. Moreover, the contribution briefly deals with the electrical systems and the control devices. Furthermore, safety assurance, quality control and technical as well as constructional characteristics especially during assembly, erection and acceptance

are described. Within the serial production of this unit type other test methods must be performed.

33002 (Juel-Spez—203, pp 9-20) **Redundancey in the process systems of large scale WECS.** Christiansen, P. Apr 1983. NTIS (US Sales Only), PC A04/MF A01. Order Number TI84751418. (CONF-8205261—).

From 8. meeting of experts - safety assurance and quality control of LS WECS during assembly, erection and acceptance testing; Stockholm, Sweden (26 May 1982).

One of the activities of the Danish wind energy programme has been to build and operate two Nibe turbines. Both Nibe prototypes are described - Nibe A and Nibe B. The number of and reasons for emergency stops of the Nibe B prototype during an operating time of 2400 hours are investigated and presented. It can be shown that the bulk of failures was caused by external factors. Some design guidelines are derived herefrom. They also refer to the hardware.

33003 (Juel-Spez—203, pp 21-29) **Standard procedures, glossary and requirements.** Simpson, P.B. Apr 1983. NTIS (US Sales Only), PC A04/MF A01. Order Number TI84751418. (CONF-8205261—).

From 8. meeting of experts - safety assurance and quality control of LS WECS during assembly, erection and acceptance testing; Stockholm, Sweden (26 May 1982).

Discussion of quality assurance of wind turbine generators should be based on an appreciation of the standard procedures that are now adopted in numerous fields for the application of quality assurance principles. This contribution therefore represents a summary of the basic terminology and requirements of quality assurance, making reference to the principle British Standards Institution Publications relating to the subject.

33004 (Juel-Spez—203, pp 31-42) **Problem prevention for large wind energy converters.** Schwarte, M. Apr 1983. NTIS (US Sales Only), PC A04/MF A01. Order Number TI84751418. (CONF-8205261—).

From 8. meeting of experts - safety assurance and quality control of LS WECS during assembly, erection and acceptance testing; Stockholm, Sweden (26 May 1982).

The quality of wind energy plants has a great influence on their economy. Today we have learned, from the operation of some large wind energy plants, where the technical limits of wind energy plants lie. One can also evaluate in which fields the most efficient and economically reasonable solutions can be found. They also determine the conditions for the design of future plants. This is particularly important for the developing countries and threshold countries where wind energy plants can provide a considerable contribution to energy supply. The author deals with the optimal size of plants, quality assurance, tower design as well as the technical equipment.

33005 (Juel-Spez—203, pp 43-55) **Safety assurance and quality control of GROWIAN.** Zwahr, H. Apr 1983. NTIS (US Sales Only), PC A04/MF A01. Order Number TI84751418. (CONF-8205261—).

From 8. meeting of experts - safety assurance and quality control of LS WECS during assembly, erection and acceptance testing; Stockholm, Sweden (26 May 1982).

Safety aspects and quality control of the large wind energy plant Growian are considered under two aspects. On one hand, the relation between the safety standards and constructional design on the other, the control activities of the operating firms are dealt with. The safety problem during the successive erection of the plant, construction and production is described. The quality control system, measures against corrosion, safety measures in the electro technical equipment, etc. are described in detail.

33006 **(NP—4901417) Recommended practices for wind turbine testing. 1. Power performance testing. 1. Edition 1982.** Frandsen, S.; Trenka, A.R.; Pedersen, B.M. (eds.). (Risoe National Lab., Roskilde (Denmark); Rockwell International Corp., Golden, CO (USA). Wind Systems Program; Danmarks Tekniske Hoejskole, Lyngby). 1982. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84901417.

This document describes the recommended practices for testing and reporting power performance characteristics of wind energy conversion systems (WECS). It provides a standard methodology for comparing the energy production characteristics of WECS available in the market. The methods presented are not limited to WECS that produce electricity. The procedures and practices are generally applicable to WECS of all sizes and classifications. Formulae are given for wind shear correction, correction of power for air density variations, and for the determination of the power curve from data. Results of the tests include mean power and annual energy output. (LEW)

33007 **(PB—84-164680) Mathematical modelling of wake interaction in wind turbine arrays. Part 1. Description and evaluation of the mathematical model.** Vermeulen, P.E.J.; Builtjes, P.J.H. (Hoofdgroep Maatschappelijke Technologie TNO, Apeldoorn (Netherlands)). 1981. 61p. NTIS, PC E04/MF E01.

This report gives a general description of a computermodel (MILLY) which can be used to calculate the mean velocity field within a cluster of wind turbines and thus to predict the power reduction caused by wake interaction effects. The predictions of this computermodel and those of two earlier models are compared with experimental data obtained by static wind turbine simulators. It is concluded that the model predictions are close to the measurement results so that engineering estimates of power output of wind turbine clusters can be made. (Copyright (c) Netherlands Organization for Applied Scientific Research TNO 1981.)

33008 **(PNL-SA—12244) Basic principles and recent observations of rotationally sampled wind.** Connell, J.R. (Pacific Northwest Lab., Richland, WA (USA)). May 1984. Contract AC06-76RL01830. 16p. (CONF-8405153—3). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013267.

From Horizontal-axis wind turbine technology conference; Cleveland, OH, USA (8 May 1984).

Portions are illegible in microfiche products.

The concept of rotationally sampled wind speed is describd. The unusual wind characteristics that result from rotationally sampling the wind are shown first for early measurements made using a 8-point ring of anemometers on a vertical plane array of meteorological towers. Quantitative characterization of the rotationally sampled wind is made in terms of the power spectral density function of the wind speed. Verification of the importance of the new concept is demonstrated with spectral analyses of the response of the MOD-0A blade flapwise root bending moment and the corresponding rotational analysis of the wind measured immediately upwind of the MOD-0A using a 12-point ring of anemometers on a 7-tower vertical plane array. The Pacific Northwest Laboratory (PNL) theory of the rotationally sampled wind speed power spectral density function is tested successfully against the wind spectrum measured at the MOD-0A vertical plane array. A single-tower empirical model of the rotationally sampled wind speed is also successfully tested against the measurements from the full vertical plane array. Rotational measurements of the wind velocity with hotfilm anemometers attached to rotating blades are shown to be accurate and practical for research on winds at the blades of wind turbines. Some measurements at the rotor blade of a MOD-2 turbine using the hotfilm technique in a pilot research program are shown. They are compared and contrasted to the expectations based upon application of the PNL theory of rotationally sampled wind to the MOD-2 size and rotation rate but without teeter, blade bending, or rotor induction accounted for. Finally, the importance of temperature layering and of wind modifications due to flow over complex terrain is demonstrated by the use of hotfilm anemometer data, and meteorological tower and acoustic doppler sounder data from the MOD-2 site at Goodnoe Hills, Washington.

33009 **(PNL-SA—12245) Large HAWT wake measurement and analysis.** Miller, A.H.; Wegley, H.L.; Buck, J.W. (Pacific Northwest Lab., Richland, WA (USA)). May 1984. Contract AC06-76RL01830. 9p. (CONF-8405153—2). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013269.

From Horizontal-axis wind turbine technology conference; Cleveland, OH, USA (8 May 1984).

Portions are illegible in microfiche products.

From the theoretical fluid dynamics point of view, the wake region of a large horizontal-axis wind turbine has been defined and described, and numerical models of wake behavior have been developed. Wind tunnel studies of single turbine wakes and turbine array wakes have been used to verify the theory and further refine the numerical models. The effects of scaling, rotor solidity, and topography on wake behavior are questions that remain unanswered. In the wind tunnel studies, turbines were represented by anything from scaled models to tea strainers or wire mesh disks whose solidity was equivalent to that of a typical wind turbine. The scale factor compensation for the difference in Reynolds number between the scale model and an actual turbine is complex, and not typically accounted for. Though it is wise to study the simpler case of wakes in flat topography, current indications are that wind turbine farm development is actually occurring in somewhat more complex terrain. Empirical wake studies using large horizontal-axis wind turbines have not been thoroughly composited, and, therefore, the results have not been applied to the well-developed theory of wake structure. The measurement programs have made use of both in situ sensor systems, such as instrumented towers, and remote sensors, such as kites and tethered, balloon-borne anemometers. A concise overview of the work performed was based on the philosophy that the MOD-2 turbines were probably the best detector of both the momentum deficit and the induced turbulence effect downwind. Only the momentum deficit aspects of the wake-machine interactions have been addressed. Both turbine power output deficits and wind energy deficits as measured by the onsite meteorological towers have been analyzed from a composite data set. The analysis has also evidenced certain topographic influences on the operation of spatially diverse wind turbines.

33010 **(RFP—3638) Design of a digital telemetry data collection system.** Carlson, J.N. Jr. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). Dec 1983. Contract AC04-76DP03533. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013916.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Collecting load data from rotating wind system components is often an integral part of research and development performed at the Department of Energy's Wind Energy Research Center (WERC) at Rocky Flats, Colorado. In order to avoid problems commonly encountered with conventional methods of data collection (i.e., signal noise caused by sliprings and the high cost of multichannel telemetry systems), a unique digital telemetry system was designed using off-the-shelf components. This flexible system not only has reduced size and cost, when compared to a previously used telemetry system, but has also proved to be very accurate in actual application. The purpose of this report is to discuss the design and operation of this system, as well as the rationale for its use.

33011 **(RFP—3678) Analysis of wind turbines in yaw.** Wilson, R.E.; Chaiyapinunt, S. (Oregon State Univ., Corvallis (USA). Dept. of Mechanical Engineering). Sep 1983. Contract AC04-76DP03533. 168p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84013620.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The yaw problems of a three-bladed, downwind, horizontal axis wind turbine are examined in this report. A four-degree-of-freedom system was chosen to model the turbine. Linearized equations of rotor and nacelle motion were developed using the energy method and Lagrange's equations. Quasi-steady blade element and momentum theories were used in developing the axial induction factor and aerodynamic loads. A computer code was developed to obtain the numerical values of coefficients of the equations of motion, thus allowing the cause of yaw instability to be studied. The study indicated that yaw tracking error is primarily caused by tower shadow. However, the wind turbine studied - besides being unstable in yaw under normal operating conditions - has an additional problem in that the nacelle shape contributes to additional instability. Blade coning, in the present design, is inadequate to overcome this instability. The sensitivity of the system stiffness coefficients to the selected input parameters was studied, and results indicate that the system stiffness coefficient is highly sensitive to the coning angle. Increasing the coning angle could significantly increase the stiffness coefficient and lead to improvement of system stability.

33012 **(RISO-M—2400) Testreport for Bonus windmill: prototype 55 kW from Danregn Vindkraft A/S. Standard measurements.** Rasmussen, P. (Risoe National Lab., Roskilde (Denmark)). Oct 1983. 36p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751005.

Portions are illegible in microfiche products.

This report contains measurements carried out using the standard procedure. The measurements give information about annual energy output, stall power regulation, system efficiency, and loads at cut-in and braking. Furthermore the top pressure at the tower has been measured.

33013 **(SAND—84-7001) Calculation of the pressure distribution on a pitching airfoil with application to the Darrieus Rotor.** Ghodoosian, N. (Oregon State Univ., Corvallis (USA). Dept. of Mechanical Engineering). May 1984. Contract AC04-76DP00789. 130p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013571.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

An analytical model leading to the pressure distribution on the cross section of a Darrieus Rotor Blade (airfoil) has veen constructed. The model is based on the inviscid flow theory and the contribution of the nonsteady wake vortices was neglected. The analytical model was translated into a computer code in order to study a variety of boundary conditions encountered by the rotating blades of the Darrieus Rotor. Results indicate that, for a pitching airfoil, lift can be adequately approximated by the Kutta-Joukowski forces, despite notable deviations in the pressure distribution on the airfoil. These deviations are most significant at the upwind half of the Darrieus Rotor where higher life is accompanied by increased adverse pressure gradients. The effect of pitching on lift can be approximated by a linear shift in the angle of attack proportional to the blade angular velocity. Tabulation of the fluid velocity about the pitching-only NACA 0015 allowed the principle of superposition to be used to determine the fluid velocity about a translating and pitching airfoil.

33014 **(SERI/STR—211-2277) Conceptual design of an electrofluid dynamic wind energy system. A subcontract final report.** Minardi, J.E.; Lawson, M.O. (Dayton Univ., OH (USA). Research Inst.). May 1984. Contract AC02-83CH10093. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84004512.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report contains a conceptual design of the electrofluid dynamic (EFD) wind-driven generator and performance estimates used to select the electrode spacing and other parameters. Various spacings and tube sizes in different wind fields were considered to assess the effects of different parameters. Although a detailed stress analysis was not done, preliminary estimates indicate that the tower design will withstand head-on winds in excess of 100 mph (44 m/s) without damage. Many opportunities appear to exist to cut the cost of an EFD wind-driven generator. Maintenance and downtime on this wind-driven generator should be less than for a conventional system with many units having rotating parts. The EFD wind-driven generator also does not require additional power conditioning for long-line power transmission. It should be possible to produce EFD wind driven-generators that are cost competitive with other methods of producing a high-voltage dc power, once a charging system is developed.

33015 **Is the wind a practical source of energy for you?.** Golden, CO; Rockwell International (1980). 10p. GPO. Contract AC04-76DP03533.

This pamphlet gives an introduction to the facts which must be considered in determining the feasibility of wind energy. These facts include determining energy requirements, the available wind energy resource, and the equipment needed to convert and use the

available energy. The cost of energy including advantages offered by the Federal Energy Credit and state tax incentives for wind systems must be considered. The steps for determining the practicality of a wind system are discussed.

33016 **(CONF-840576—5) Persistence of the Hopf bifurcation under singular perturbations.** Abed, E.H. (Maryland Univ., College Park (USA). Dept. of Electrical Engineering). May 1984. Contract AC01-82CE76221. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013871.

From International symposium on circuits and systems - ISCAS'84; Montreal, Canada (7 May 1984).

Portions are illegible in microfiche products.

The purpose of this paper is to study persistence of the Hopf bifurcation under singular perturbations of the associated vector field. Both single parameter and multiparameter singular perturbation problems are considered. In each case, hyperbolicity of an associated fast time system is shown to imply persistence. For single parameter singular perturbation problems, we employ Fenichel's center manifold theorem for singularly perturbed systems [1] to prove regular degeneration of the bifurcated periodic solutions and to study their stability.

33017 **(CONF-840652—4) Analysis of small disturbance stability regions of power system models with real and reactive power flows.** Liu, C.C.; Wu, F.F. (Washington Univ., Seattle (USA). Dept. of Electrical Engineering; California Univ., Berkeley (USA)). Jun 1984. Contract AC01-82CE76221. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013872.

From American Automatic Control conference; San Diego, CA, USA (6 Jun 1984).

Portions are illegible in microfiche products.

Small-disturbance (SD) stability regions of power systems models incorporating bus voltage variation and the real and reactive power flow equations are analyzed. It is shown that SD stability regions may be disconnected. Furthermore, the regions contain finitely many components in a compact domain of interest. A sufficient condition is derived for a domain to have a unique SD stable solution of the real and reactive power flow equations. Other analytic properties of the SD stability regions are also investigated.

33018 **(DOE/ET/29038—1) Research progress in dynamic security assessment.** (Analytic Sciences Corp., Reading, MA (USA)). Dec 1982. Contract AC01-79ET29038. 129p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013140.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Areas discussed are power system modeling, state estimation, structure decomposition, state forecasting, clustering and security measure development. A detailed dynamic model of a multi-machine power system has been developed. A process state estimator was developed to estimate the long-term dynamic behavior of the power system. The algorithm is identical to the extended Kalman filter but has a modified process noise driving term. A two-stage structure estimation technique was proposed for identifying the power system network configuration. Two approaches to structure decomposition were investigated. A time-scale decomposition of the system equations, based on a singular perturbation approach, was evaluated using a detailed model of a generating system. Spatial decomposition was examined by applying an optimal network decomposition technique to a 39-bus test system. Stochastic approximation based approaches to estimator simplification were examined. Explicit expressions were obtained for the evolution of the first and second moments of the system state. Research into security measures proceeded in three directions. The first area involves viewing the security assessment problem as a hyperplane crossing problem for a stochastic process. The second approach examined the stability of an unforced linear system where the system coefficients are subject to future jumps. The third area of research has led to the formulation of a security measure suitable for on-line assessment of transient stability.

33019 **(DOE/ET/29364—1) Probabilistic steady-state and dynamic security assessment.** (California Univ., Berkeley (USA)). Mar 1984. Contract AC01-79ET29364. 159p. NTIS, PC A08; 3; GPO Dep. Order Number DE84013572.

Paper copy only, copy does not permit microfiche production. Original copy available until stock is exhausted.

Discussed are: state-of-the-art in security assessment, framework for probabilistic steady-state and dynamic security assessment, steady-state security regions, dynamic security regions, dynamic reliability, external network modeling, and dynamic equivalents. (DLC)

33020 **(DOE/RA/50419—1) Decentralized system theory.** Berger, T. (Cornell Univ., Ithaca, NY (USA). School of Electrical Engineering). May 1984. Contract AC01-80RA50419. 12p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013658.

The research done under this grant deals with different aspects of decentralized systems theory in the context of large-scale systems. Our contributions fall in three main areas - decentralized communication theory, decentralized information theory, and decentralized control.

33021 **(DOE/RG/10409—T2) Hayden Station: power plant maintenance system preventive maintenance program.** (Colorado-Ute Electric Association, Inc., Montrose (USA)). 15 Jun 1984. Contract FG01-80RG10409. 115p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013309.

Portions are illegible in microfiche products.

The Initial Report and the First Interim Progress Report included a copy of the Preventive Maintenance Questionnaire. In the past two years, the rating went from 80 (excellent) to 82 (excellent). Progress is still being made in most areas but it consists of fine tuning the existing programs. The Generation Statistics are included. The availability factor for the past 12 months was 79.3% for Unit No. 1 and 93.9% for Unit No. 2, an improvement of 5.3% and 5.9%, respectively, over 1980.

33022 **(EPRI-EL—3505) Revenue-metering device for HVDC systems. Final report.** Schweitzer, E.O. III; Ando, M.; Aliaga, A.; Baker, R.; Seamans, D. (Washington State Univ., Pullman (USA). Dept. of Electrical and Computer Engineering). May 1984. 299p. Electric Power Research Institute-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920413.

This final report describes a digital dc revenue metering device for HVDC systems developed by Washington State University researchers under a contract with the Electric Power Research Institute. The device was installed at the Sylmar Converter Station of the Los Angeles Department of Water and Power in November 1981, and has been operating satisfactorily for over 20 months. It uses voltage and current measurements from existing voltage dividers, current transductors, and a current shunt. The energy-computation algorithms are implemented using digital signal processing principles in a single eight-bit microprocessor (Motorola MC6809). The algorithms accommodate the different characteristics of the sensors, and tolerate the unavailability of some of the sensors, with some loss in accuracy. Comparisons of the dc Revenue Meter energy measurements with the ac revenue meter measurements plus the station losses reveal a 0.1 percent difference in one pole and a one percent difference in the other pole, for a net difference of about one-half percent.

2001 Power Plants And Power Generation

REFER ALSO TO CITATION(S) 33469, 33913

33023 **(CONF-840804—12) Overview of design of advanced fossil fuel systems (DAFFS) study.** Bomkamp, D.H.; Bezella, W.A.; Smith, R.S.; Pietruszkiewicz, J. (Argonne National Lab., IL (USA); Bechtel Group, Inc., San Francisco, CA (USA)). 1984. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011725.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

The objective of the DAFFS (Design of Advanced Fossil Fuel Systems) study was to characterize the costs and performance of three advanced power generation technologies: Pulverized Coal Fired with Advanced Flue Gas Desulfurization, Pressurized Fluidized Bed, and Integrated Gasification Combined Cycle. Uniform ground rules and a 1990 state-of-the-art frame of reference were established to obtain designs incorporating reasonable and comparable extrapolations from present levels of performance. The study is intended to provide baseline reference data for future estimates of the potential benefits of component and performance development beyond the levels assumed in the study.

33024 **(DOE/ET/29365—11) Emergency state control methods. Executive Summary.** (Purdue Univ., Lafayette, IN (USA)). May 1984. Contract AC01-79ET29365. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013320.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This research is divided into two parts: Part I - Study of Several Emergency State Control Methods and Part II - Decentralized Control of Large Transients in Power Systems. The work under Part I is divided into the following areas of investigation: phase rotation as a means of augmenting transient stability; the development of a simplified functional representation of a static VAR system for the study of subsynchronous damping controls; underfrequency load shedding; transient stability enhancement in multimachine power systems using braking resistors; simulation of the New England Test System; and reactive power control to alleviate bus voltage violations in an ac-dc system. These areas all have the focus of improving system stability in the emergency state. In this report each of these areas of research is summarized. Part II of the contract (Decentralized Control of Large Transients in Power Systems) is reported in detail in a separate document (TR-EE 83-25). Briefly the report summarized the research conducted in the decentralized control of interconnected systems with applications to ac/dc Multiterminal Systems and a nonlinear controller design of two interconnected synchronous machines.

33025 **(EPRI-EL—3391) High-voltage stator winding development. Final report.** (General Electric Co., Schenectady, NY (USA)). Apr 1984. 282p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920318.

This report describes the work funded by the Electric Power Research Institute, Inc. for assessing the technical and economical feasibility of developing transmission-level-voltage superconducting generators for central station electric utility applications. Section 1 provides a summary of the study and describes the purpose, objectives, and the general conclusions of the study. Section 2 describes the monolith cylinder armature design, which was selected as the concept having the best chance of proving to be technically and economically feasible. Section 3 describes the commercial acceptance tests necessary to qualify the insulation systems of high-voltage generators. Section 4 describes the power system considerations of connecting high-voltage generators directly to the transmission lines. Section 5 describes several secondary high-voltage generator design concepts and the reasons for their technical and economical infeasibility. Section 6 describes economic analyses comparing the long-term economic benefits of low-voltage and high-voltage superconducting generator development programs. Section 7 summarizes the final design recommendation for the monolith cylinder armature and discusses the reasons for its selection and some of its known limitations. Section 8 describes a possible follow-on hardware development program which would be necessary to confirm the results of the analytical studies discussed in this report.

33026 **(EPRI-NP—3538) Design and fabrication of steam turbine disc NDE test-bed facilities. Final report.** Beverly, R.L.; Van Der Veer, W.R.; Reinhard, B.W.; Light, G.M. (Southwest Research Inst., San Antonio, TX (USA)). May 1984. 43p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920419.

Two nondestructive examination test-beds have been built to support the development of improved ultrasonic examination techniques for steam turbine discs. These test beds have been designated the static test-bed and the dynamic test-bed. The static test-bed, consisting of a stationary disc segment, manually operated scan mechanism, and immersion tank, was designed to support the development of ultrasonic techniques utilizing focused, immersion transducers for examination of the bore and keyway region of discs on assembled steam turbine rotors. The dynamic test-bed, on the other hand, was to simulate field inspection conditions by rotating a full-bladed disc at a low angular velocity. The speed of disc rotation, provided by a set of powered turning rolls, can be accurately controlled over a range of approximately 80:1. The angular position of the disc, precisely encoded and displayed on a digital readout, is reproducible to +-0.001 degree. Although the dynamic test-bed presently has no provisions for ultrasonic technique development, the static test-bed scan mechanism is expected to be adapted to the dynamic test-bed in the future. This report describes the design considerations, operational capabilities, and repeatability and verification testing associated with these test-beds.

33027 (INIS-mf—8861, pp 389) **Reliability prediction of different on-line control systems.** Welfonder, E.; Jaeckel, K. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

The reliability of different on-line control systems was compared. The digital concept with multiple-purpose microprocessor modules was found to be only slightly more reliable than the conventional concept of single-purpose IC modules. Further, bus signal transfer is only slightly less efficient than parallel signal transfer. Digital concepts with bus signal transfer are less efficient by a factor 1.6. stronger variation of single parameters did not affect the validity of the comparison.

33028 (INIS-mf—8861, pp 389) **Experience with differential pressure devices for flow metering in acceptance and control testing.** Herbst, R. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

Standardized differential pressure devices are discussed on the basis of long-term practical experience in acceptance testing and inspection. The error margin of the devices should be as narrow as possible. The different requirements of in-service measurements, acceptance tests and inspections must be taken into account. The paper, which is based on the VDI rules for flow metering, DIN 1952 of August 1971, comprises the three sections: 1. Design of differential pressure devices; 2. Testing; 3. Installation.

33029 (INIS-mf—8861, pp 389) **Possibilities and procedures for maintenance of on-line control systems.** Goertz, G.; Boesken, W. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

At HEW, the power plant and network operation, maintenance and control functions are concentrated in a single department. Power plant operation comprises control and servicing as well as detection and removal of failures. The repair service is responsible for large-scale repair and, according to a certain schedule, revisions and maintenance of all HEW facilities. Large machines, large electrical components and control system components are repaired in a central repair shop. The author describes the structure of the operating and maintenance department with a view to the control systems.

33030 (INIS-mf—8861, pp 389) **First results of outage statistics of on-line control systems.** Houzer, H.G. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

A detailed statistics of outages of on-line control systems was started in 1981 in the framework of VGB failure statistics. The reasons for this, the targets, extent and initial results are presented, and the necessary further research activities are presented.

33031 (INIS-mf—8861, pp 389) **Present on-line control concepts - necessity or luxury.** Wetzl, R. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

Information is given on the following subjects: Extent of on-line control; selection of protective and monitoring systems with a view to plant protection and availability; strain for the power plant personnel due to excessive information and new technologies; user-friendly arrangement of the operating and monitoring equipment in the control room; computer applications; future power plant instrumentation; maintaining the diversity of equipment and producers in spite of the general introduction of bus systems. The article closes with a rough outline of on-line power plant control in future STEAG power plants and the author's opinion on bus technology in power plants in general.

33032 (INIS-mf—8861, pp 389) **New on-line control generation in the view of the user critical review and requirements.** Hoepner, A.E. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

Despite their advantages, e.g. as regards interfences, the new systems also have some drawbacks. To make optimum use of the new systems - instead of just taking over the functions of the existing systems -, careful planning and some operating experience will be necessary both on the producers' and the users' side. Producers and users will have to reconsider some technical and organisational problems, and early staff training is required for planning, start-up and operation. Standardisation of bus systems and languages is an urgent task for the producers.

33033 (INIS-mf—8861, pp 389) **Ideas to improve on-line control documentation with a view to new on-line control concepts.** Kauffeld, W. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

On-line control documentation, especially of highly automatic power plant units, still has a number of shortcomings which ought to be avoided. The problem is defined, and some solutions are presented. New control systems will bring about considerable improvements. Producers ought to pay more attention to the practical requirements of power plant operation. This, in turn, makes it necessary for the users to define their wishes more precisely.

33034 (INIS-mf—8861, pp 389) **Conception of control room design from the view of the user.** Rick, E. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

The control room of a power plant is the interface between the operators and the technical process. The operators and their tasks are discussed at length, and it is recommended to divide the control room into separate working areas designed according to anthropotechnical considerations. Apart from air conditioning, lighting and acoustics, the control room layout is also influenced by the division of functions between man and machine. Several examples of control room concepts are presented.

33035 (INIS-mf—8861, pp 389) **Planning experience with a modern on-line control concept.** Herrmann, G. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

The on-line control system for unit 7 of Grosskraftwerk Mannheim AG has been ordered from BBC. This unit is the first to be equipped with a complete on-line control system covering the functions of data acquisition, transfer and processing by a bus system. The project is described in order to give an impression of its scope and difficulties. Unit 7 is a combined heat-and-power plant for electric power generation and district heating, with a total installed capacity of 475 MW. A single-flue steam generator with a height of 108 m, with a supercritical live steam of 260 bar, 530°C and double intermediate superheating of the flue gas produces 1370 t/h of live steam which is led onto a serially connected back-pressure turbine with intermediate superheating at 40 to 100 bar (load-dependent sliding pressure) and a back-pressure of 20 bar. Turbine M has a rated capacity of 195 MW el.

33036 (INIS-mf—8861, pp 389) **Status and trends of turbine control.** Pleesz, N. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

With the increasing number of interconnected systems and the resulting higher demands on turbogroup automation, also the demands on turbine control systems have become more stringent. Permissible variations have become smaller and higher reliability is required. On-line control systems can meet these demands.

33037 (INIS-mf—8861, pp 389) **On-line control systems in auxiliary devices.** Stoehr, H.J. 1982. (In German). NTIS (US Sales Only), PC A19/MF A01. Order Number DE84780509.

From VGB conference on on-line control systems in power plants 1982; Essen (Germany, F.R.) (1982).

Auxiliary systems are either attached to single power plant units, or they may serve several or all units of a power plant. Depending on the process, different modes of operation are possible. The degree of automation and availability depend on the mode of operation, length of operating periods, and number of operating periods in a given time interval. Independent, continuously operating auxiliary systems are: Waste water disposal systems, waste disposal systems, HVAC systems, service water supply systems, compressed-air systems.

33038 (MIT-EL—84-006) **Effects of technological change, experience and environmental regulation on the construction costs of coal-burning generating units.** Joskow, P.L.; Rose, N.L. (Massachusetts Inst. of Tech., Cambridge (USA). Energy Lab.). Mar 1984. Contract AT01-76EV70012. 73p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84012737.

This paper provides an empirical analysis of the technological, regulatory and organizational factors that have influenced the costs of building coal-burning steam-electric generating units over the past twenty year. We obtain empirical estimates of economies of scale in construction costs, learning effects associated with utilities and architect-engineers, the costs of environmental regulation, patterns of construction productivity, and cost differences between generating technologies. The analysis is based on a sample of over 400 generating units placed in operation between 1960 and 1980. Information on generating unit availability is integrated with the construction cost evidence to suggest that the abandonment of supercritical technology in the early 1980's is likely to be a consequence of poor operating performance as well as sharply reduced demand expectations rather than a consequence of high construction costs for this technology at large scale. 29 references, 1 figure, 10 tables.

33039 (NE—1983-19) **Cogeneration of electric power and heat by small plants. Possible techniques, need of development and conceivable energy supplies in Sweden.** Gustafsson, B.; Johansson, A.; Kjellstroem, B. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). Jun 1983. 388p. (In Swedish). NTIS (US Sales Only), PC A17/MF A01. Order Number DE84751007.

Portions are illegible in microfiche products.

The possible introduction of small cogeneration plants for electric power and heat is discussed. It is planned to use domestic solid fuels with the size of the plants not exceeding 25 MW with a heat energy of 50 MW. The future needs are estimated to be between 3 and 41 TWh per year by the year 2010, as produced by

small plants. Various small power plant techniques are described and discussed (G.B.).

33040 **(NEAC—19) Electricity in the Australian energy market.** (National Energy Advisory Committee (Australia)). 1983. 47p. Australian Government Publishing Service, Canberra.

Within the summary of conclusions and recommendations, the National Energy Advisory Committee investigating electricity in the Australian energy scene, made the following point: the Australian electricity supply industry is faced with the need for a further substantial expansion over the next decade (albeit at a lower rate than over the past decade) requiring the expenditure of tens of billion of dollars. Some savings in this expenditure could be achieved if the utilization of the installed plant, currently amounting to 3710 kWh per annum per kW of installed capacity (42 per cent), could be improved. Capital savings of this kind should be pursued only to the extent that they are economically worthwile, i.e. to the extent that they would result from the application of appropriate pricing and related policies. Appropriate pricing policies would include the greater use than at present of maximum demand charges and time of day tariffs.

33041 **(OEFZS—4266) How to increase the efficiency of thermal power stations.** Schwarz, N. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H., Vienna). Feb 1984. 13p. (In German). (CONF-840159—). Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H.

From Seminar on energy-relevant activities; Vienna, Austria (17 Jan 1984).

The development of power stations shows, that within a given technical framework, total thermal efficiencies increase continually. A stepwise increase is achievable with the introduction of new technical developments. Examples are the change from piston engines to vapour-turbines and the introduction of combined cycles with gas turbines. According to the present technical know-how the use of a potassium topping cycle should be the next development step in the construction of power stations. The activities for the realization of such a power station are described.

2002 Environmental Aspects

33042 **(DOE/FE/60148—T3) Adsorbent regenerator. Monthly progress report, August 1, 1983-September 30, 1983.** (NOXSO Corp., Paducah, KY (USA)). 31 Oct 1983. Contract AC22-82FE60148. 14p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012969.

This report covers work accomplished under DOE Contract No. DE-AC22-FE60148 during the period August 1, 1983 through September 30, 1983. The report presents the detailed design of the prototype moving-bed regenerator which will be built and tested under Phase II of this contract. It also contains experimental results from a test series using hydrogen as a reducing gas and a series using a NOXSO sorbent containing an iron catalyst. It also presents the results of AAJA attrition tests on chemically cycled sorbents containing 9.1% sodium, with and without the iron catalyst. 6 figures, 1 table.

33043 (EPRI-CS—3182-Vol.1, pp 32.1-32.24) **Current status of dry NO/sub x/-SO/sub x/ emission control processes.** Dalton, S.M. Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Combined NO/sub x/-SO/sub x/ control techniques using a variety of complex chemical flue gas treatment processes have been proposed by a number of manufacturers. The wet chemical NO/sub x/-SO/sub x/ processes are generally not economically competitive and development has shifted to dry NO/sub x/-SO/sub x/ techniques. Three dry techniques that are currently being widely pursued as alternatives to wet FGD/selective catalytic reduction are discussed in some detail in this paper: the copper oxide processes, the carbon adsorption processes, and the electron-beam (E-beam) irradiation processes. There are at least five versions of the copper oxide process, eight versions of the carbon adsorption process with No/sub x/-SO/sub x/ reduction and two versions of the E-beam concept. All of these processes appear capable of achieving over 90% SO_2 removal and greater than 70% No/sub x/ removal, although the power plant economic and operational impacts are not fully understood. None of the processes are in service commercially, though active development is underway in the US, Japan, and Germany. 6 references, 8 figures, 7 tables.

2003 Power Transmission And Distribution

33044 **(CONF-831042—) Urban applications of HVDC power transmission.** (Oak Ridge National Lab., TN (USA)). 1983. Contract AC05-84OR21400. 379p. NTIS, PC A17/MF A01; 1; GPO Dep. Order Number DE84012565.

From Symposium on urban applications of HVDC power transmission; Philadelphia, PA, USA (24 Oct 1983).

Nineteen papers are included, treating topics such as: dc system support, cables, underground transmission, insulators, converters, circuit breakers, etc. (DLC)

33045 **(CONF-840403—2) Current assessment of the potential of dielectric gas mixtures for industrial applications.** Bouldin, D.W.; James, D.R.; Pace, M.O.; Christophorou, L.G. (Oak Ridge National Lab., TN (USA); Tennessee Univ., Knoxville (USA)). Apr 1984. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84011658.

From 4. international symposium on gaseous dielectrics; Knoxville, TN, USA (29 Apr 1984).

The need for more efficient, economical electrical power transmission and distribution has given impetus to the investigation of new insulating gases. Since no single gas can meet all of the multiple needs and operating conditions that exist in power apparatus, mixtures have been studied with the goal of tailoring the dielectric for a specific application by exploiting the properties of the component gases. This report reviews research results on dielectric gas mixtures and assesses the potential of such mixtures for industrial applications. The topics considered include electrical breakdown characteristics, physical and chemical properties, and economics.

33046 **(CONF-840576—3) Application of singular perturbation techniques to power system transient stability analysis.** DeMarco, C.L.; Bergen, A.R. (California Univ., Berkeley (USA)). 1984. Contract AC01-82CE76221. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84014007.

From International symposium on circuits and systems - ISCAS'84; Montreal, Canada (7 May 1984).

Portions are illegible in microfiche products.

This work extends Lyapunov techniques for power system transient stability analysis to system models incorporating voltage magnitude variation, real and reactive power loads, and flux decay effects. A method of estimating the domain of attraction of an asymptotically stable equilibrium in the resulting system of differential equations with algebraic constraints is examined.

33047 **(DOE/BP—8) Living and working around high-voltage power lines.** (USDOE Bonneville Power Administration, Portland, OR). Aug 1981. 11p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012151.

This booklet presents safe practices that you should follow if your activities take you near high-voltage transmission lines. It documents information that has generally been available to the public.

33048 **(N—8419844) Static and dynamic behavior of mechanical components associated with electrical transmission lines.** Trainor, P.G.S.; Popplewell, N.; Shah, A.H.; Pinkney, R.B. (Manitoba Univ., Winnipeg (Canada)). Jun 1983. 12p. SVIC, Code 5804, Naval Research Lab.,;Washington, D.C. 20375.

In the Shock and Vibration Digest, Vol. 15, No. 6, pages 27-38 (SEE N84-19841 10-39).

This article describes the behavior of transmission towers, insulator strings, conductors, and foundations as determined from theoretical analyses, model testing, and full-scale tests. Line vibration is also briefly reviewed.

33049 **(NP—4770267) Radial, internal network equivalent for safety monitoring of interconnected networks with a number of regional control centers.** Hager, H. (Eidgenoessische Technische Hochschule, Zurich (Switzerland)). 3 Jul 1981. 191p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE84770267.

Portions are illegible in microfiche products.

Knowledge of suitable equivalents of neighbouring networks is necessary in order to carry out simulations of this kind. Each control centre produces an equivalent network through internal network reduction on its own part of the system and passes it on to the neighbouring control centres. The properties of an equivalent network for this purpose are: Transmission of a small amount of data; simple topology (no intermeshed equivalent); an accuracy just adequate for the purpose; internal node powers are concentrated on equivalent nodes, not displaced to border nodes; access to nodes when applying disturbances; no transmission of detailed operational data; visibility of system response to changes in load and generation. The displacement of internal node powers is avoided by employing the REI equivalent, whilst a meshed network is reduced to a radial tree-shaped equivalent of limited accuracy. A least square fit minimizes the reproduction error and suitable search algorithms yield an optimal tree structure (GRANEQ = General RAdial Network EQuivalent).

33050 **(NP—4770268) Static thyristor controlled regulating transformers for electric power systems.** Gueth, G. (Eidgenoessische Technische Hochschule, Zurich (Switzerland)). 1982. 185p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE84770268.

Portions are illegible in microfiche products.

Static thyristor controlled regulating transformers for electric power systems are demonstrated to be attractive devices for power flow control and to provide a substantial improvement in the stability behavior of the power system. A concept of a practical static tap changing regulating transformer is presented which generates essentially no harmonics. The tap positions are changed at discrete points in time corresponding to current zero crossings, hence on-off control can be executed as rapidly as every 10 msec. For practical purposes, this is almost time continuous. A robust control algorithm for the control of a static phase shifting or quadrature boost transformer is presented. The control commands are generated using local measurements (voltage and complex power at the transformer), specified power flow, and imprecise values of equivalent impedances of the power systems. Simulation results of typical single and multimachine power systems are presented to illustrate the operation of the static phase shifting transformer. Further tests on a hardware model, in which programmable power supplies simulate dynamically changing power system voltages, are described. These tests include a wide variety of power system operation conditions which illustrate the effects of the static phase shifting transformer on power flow control, transient stability and steady state stability.

33051 **(ORNL/TM—8724) Summary of multiterminal high-voltage direct current transmission technology.** Biggs, R.B.; Jewell, W.T. (Oak Ridge National Lab., TN (USA)). May 1984. Contract AC05-84OR21400. 37p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013625.

This report summarizes the present state of multiterminal (MT) high-voltage direct current (HVDC) power transmission. The purpose is to reassess the need for HVDC circuit breakers and to identify needed research for MT HVDC. The fundamentals of this technology are presented, and previous research and development is reviewed. Although no MT HVDC systems have yet been built, many concepts have been proposed. Some require a dc breaker, and others do not. Both options have advantages and disadvantages for various applications, so the selection will depend on the proposed application. Research is needed to define operating characteristics of various MT HVDC systems. In some applications, dc breakers will be useful, so research into HVDC interruption should continue. Also, dc fault detection and control algorithms for MT systems should be studied.

33052 **(UCRL—15613) Power factor improvement study for an electrical power distribution system for University of California, Lawrence Livermore National Laboratory, Livermore, California.** (Brown and Root Development, Inc., San Francisco, CA (USA)). Dec 1983. Contract W-7405-ENG-48. 187p. NTIS, PC A09/MF A01; 1; GPO Dep. Order Number DE84012851.

Portions are illegible in microfiche products.

This report summarizes the results, findings, methods of analysis, and recommendations of a power factor improvement study for the site electrical distribution system of the University of California, Lawrence Livermore National at Livermore, California. The purpose of this study is to determine a suitable means to improve the site power factor to at least an average of 95% in order to preserve the economic advantage of WAPA service.

21 NUCLEAR POWER PLANTS

33053 **(CONF-840916—2) Uncertainty covariances in robotics applications.** Smith, D.L. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013417.

From Robotics and remote handling in the nuclear industry conference; Toronto, Ontario, Canada (23 Sep 1984).

Portions are illegible in microfiche products.

The application of uncertainty covariance matrices in the analysis of robot trajectory errors is explored. First, relevant statistical concepts are reviewed briefly. Then, a simple, hypothetical robot model is considered to illustrate methods for error propagation and performance test data evaluation. The importance of including error correlations is emphasized.

33054 (EPRI-NP—3347-SR, pp 11.1-11.3) **Backlay clad inspection.** Fleming, M.F.; Humphries, J.C. (Amdata Systems, Inc., San Jose, CA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Some BWR owners have used weld overlay clad as an interim repair of piping with intergranular stress-corrosion cracking (IGSCC). Accurate inspection techniques are required for determining crack growth after the cladding application. Conventional ultrasonic approaches are unlikely to be adequate. An alternative possibility is the use of a piezoelectric/electromagnetic acoustic transducer (PE/EMAT) system or an EMAT/EMAT system. Purpose of this project is to determine the feasibility and field applicability of the PE/EMAT and EMAT/EMAT system approaches using currently available upgraded transducers.

33055 (EPRI-NP—3347-SR, pp 18.1-18.12) **Experimental surveillance of intergranular stress corrosion crack growth in large pipes.** Bickford, R.L. (Battelle-Northwest Labs., Richland, WA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Intergranular stress corrosion cracking (IGSCC) in 304 stainless steel pipe weldments continues to be a major concern to the nuclear industry. EPRI through the Boiling Water Reactor Owners' Group is conducting extensive research efforts in the de-

velopment of nondestructive instrumentation and techniques for the detection of cracks and monitoring of crack growth. The work reported here supports these crack surveillance efforts by providing realistic specimens for instrumentation development and testing. The program consists of two functions: (a) produce specimens consisting of pipe weldments with backlay cladding applied in various thicknesses; and (b) operate a pipe test stand containing a 26 in. diameter Sch. 80 welded specimen under simulated BWR temperature and water chemistry conditions as a crack surveillance instrument test bed.

33056 (EPRI-NP—3347-SR, pp 19.1-19.16) **Continuous ultrasonic sampling of in-service nuclear plant piping.** Fleming, M.F.; Humphries, J.C. (Amdata Systems, Inc., San Jose, CA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

The objective of EPRI Contract T104-2 is the development and proof of feasibility of a surveillance system for in-service monitoring of intergranular stress-corrosion cracking (IGSCC) in piping weldments. The surveillance system must be capable of monitoring the pipe weldments for extended periods in the environments characteristic of boiling-water-reactor (BWR) power plants.

33057 (EPRI-NP—3521) **In-plant measurements of electrochemical potentials in BWR water. Final report.** Leibovitz, J.; Kassen, W.R.; Pearl, W.L.; Sawochka, S.G. (NWT Corp., San Jose, CA (USA)). May 1984. 114p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920421.

Long term electrochemical potential (ECP) monitoring in an operating boiling water reactor (BWR) was achieved using improved electrode designs developed at NWT Corporation. The ECP of various materials at 270°C increased toward a long term value independent of the material tested and apparently representative of the BWR piping. The apparent steady state ECP of 304 SS increased from -370 mV in mid-1979, to zero mV in August 1980, and to +100 mV in October 1982. An explanation for this ECP behavior is proposed, and a theoretical relation is developed between long term ECP and radiation buildup, consistent with the plant data. A mechanism of intergranular stress corrosion cracking (IGSCC) of sensitized 304 SS is proposed which indicates that the susceptibility to IGSCC should increase with increasing ECP in the range of ECP observed at the plant, consistent with trends observed in laboratory experiments. Results indicate that in-plant ECP monitoring at BWRs offers a tool for assessing plant changes that are not apparently reflected during the extensive normal plant chemistry measuring program.

33058 (IAEA-SMR—68/2, pp 71-130) **Fundamentals of boiling water reactor (BWR).** Bozzola, S. (AMN Ansaldo Impianti, Genoa (Italy)). Jun 1982. NTIS (US Sales Only), PC A25/MF A01. Order Number TI84780440.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

These lectures on fundamentals of BWR reactor physics are a synthesis of known and established concepts. These lectures are intended to be a comprehensive (even though descriptive in nature) presentation, which would give the basis for a fair understanding of power operation, fuel cycle and safety aspects of the boiling water reactor. In the first lecture general description of BWR is presented, with emphasis on the reactor physics aspects. A survey of methods applied in fuel and core design and operation is presented in the second lecture in order to indicate the main features of the calculational tools. The third and fourth lectures are devoted to review of BWR design bases, reactivity requirements, reactivity and power control, fuel loading patterns. Moreover, operating limits are reviewed. The basic elements of core management are also presented. The constraints on control rod movements during the achieving of criticality and low power operation are illustrated in the fifth lecture. Some considerations on plant transient analyses are also presented in the fifth lecture, in order to show the impact between core and fuel performance and plant/system performance. The last lecture is devoted to the open vessel testing during the startup of a commercial BWR. A control rod calibration is also illustrated.

33059 (IAEA-SMR—68/2, pp 279-322) **Power operation, measurement and methods of calculation of power distribution.** Lindahl, S.O.; Bernander, O.; Olsson, S. (ASEA-ATOM AB, Vaesteraas (Sweden)). Jun 1982. NTIS (US Sales Only), PC A25/MF A01. Order Number TI84780440.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

During the initial fuel loading of a BWR core, extensive checks and measurements of the fuel are performed. The measurements are designed to verify that the reactor can always be safely operated in compliance with the regulatory constraints. The power distribution within the reactor core is evaluated by means of instrumentation and elaborate computer calculations. The power distribution forms the basis for the evaluation of thermal limits. The behaviour of the reactor during the ordinary modes of operation as well as during transients shall be well understood and shall be such that the integrity of the fuel and the reactor systems is always well preserved.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

The heart of a nuclear power station is the reactor core producing power from the fissioning of uranium or plutonium fuel. Expertise in many different technical fields is required to provide fuel for continuous economical operation of a nuclear power plant. In general, these various technical disciplines can be dichotomized into "out-of-core" and "in-core" fuel management. In-core fuel management is concerned, as the name implies, with the reactor core itself. It entails calculating the core reactivity, power distribution, and isotopic inventory for the first and subsequent cores of a nuclear power plant to maintain adequate safety margins and operating lifetime for each core. In addition, the selection of reloading schemes is made to minimize energy costs.

33061 (JAERI-M—83-056) **User input manual for single fuel rod behaviour analysis code FEMAXI-III.** Saito, Hiroaki; Yanagisawa, Kazuaki; Fujita, Misao. (Japan Atomic Energy Research Inst., Tokyo). Mar 1983. 55p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84702048.

Principal objectives of safety related research in connection with light water reactor fuel rods under normal operating condition are mainly addressed to assess fuel integrity under steady state condition and to generate initial condition under hypothetical accident. These assessments have to be based principally upon steady state fuel behaviour computing codes that are able to calculate fuel conditions. To achieve these objectives, efforts have been made to develope an analytical computer code that calculates in-reactor fuel rod behaviour in best estimate manner. The computer code developed for the prediction of the long-term burnup response of single fuel rods under light water reactor conditions is the third in a series of code versions: FEMAMI-III. The code calculates temperature, rod internal gas pressure, fission gas release and pellet-cladding interaction related rod deformation as a function of time-dependent fuel rod power and coolant boundary conditions. This document

serves as a user input manual for the code FEMAMI-III which was opened to the public in year of 1982. A general description of the code input and output are included together with typical examples of input data. A detailed description of structures, analytical submodels and solution schemes in the code shall be given in the separate document to be published.

33062 **(NUREG—0020-Vol.8-No.4) Licensed operating reactors. Status summary report data as of March 31, 1984. Vol. 8, No. 4.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management). May 1984. 411p. NTIS, PC A18/MF A01 - GPO*. Order Number DE84901261.

Portions are illegible in microfiche products.

The US Nuclear Regulatory Commission's monthly Licensed Operating Reactors Status Summary Report provides data on the operation of nuclear units as timely and accurately as possible. This information is collected by the Office of Resource Management, from the Headquarters Staff of NRC's Office of Inspection and Enforcement, from NRC's Regional Offices, and from utilities. This report is divided into three sections: the first contains monthly highlights and statistics for commercial operating units, and errata from previously reported data; the second is a compilation of detailed information on each unit, provided by NRC Regional Offices, IE Headquarters and the Utilities; and the third section is an appendix for miscellaneous information such as spent fuel storage capability, reactor years of experience and non-power reactors in the United States.

33063 **(NUREG/CR—3523) Ranking scheme for making decisions on the relative training importance of potential nuclear power plant malfunctions.** Selby, D.L.; Hensley, W.T. (Oak Ridge National Lab., TN (USA)). Jan 1984. Contract W-7405-ENG-26. 113p. (ORNL/TM—8950). NTIS, PC A06/MF A01; 1 - GPO; GPO Dep. Order Number DE84008011.

Portions are illegible in microfiche products.

The research summarized in this report was conducted as part of a program entitled Nuclear Power Plant Entry Level Qualification and Training. A process is developed to assist in the selection of plant malfunctions which should be specifically addressed as part of the training program, and further guidance is given for determining which of those malfunctions should be included in simulator training. Consequences (C), difficulty (D), and frequency (F) rating forms are developed to determine the relative importance of training for any system malfunction. Plant malfunctions were categorized for 46 plant systems. Thirteen of these malfunction categories were then used to demonstrate the C-D-F rating forms. 15 references.

33064 **(NUREG/CR—3600) Data summary report for fission product release test HI-4.** Osborne, M.F.; Collins, J.L.; Lorenz, R.A.; Norwood, K.S.; Travis, J.R.; Webster, C.S. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 69p. (ORNL/TM—9011). NTIS, PC A04/MF A01; 1 - GPO; GPO Dep. Order Number DE84012858.

Portions are illegible in microfiche products.

The fourth in a series of high-temperature fission product release tests was conducted in which a 20.3-cm-long fuel specimen from the Peach Bottom-2 reactor was heated for 20 min at a maximum temperature of ~ 1850°C in a flowing steam-helium atmosphere. The test specimen was part of a fuel rod which was irradiated to ~ 10.10 MWd/kg. Posttest metallographic examination of the fuel specimen revealed evidence of cladding melting at each of the transverse cuts that were made. Gas analysis during the test indicated that ~ 54% of the cladding was oxidized. Total oxidation did not occur because of the low stream flow which was used. Gamma spectrometry (GS) and neutron activation (NA) analyses of test components revealed the following releases: (1) GS - 21.1% ^{85}Kr, 31.7% ^{137}Cs; and (2) NA - 24.7% ^{129}I. A value of 35.8% cesium release was determined by counting the fuel rod segment before and after the test. If the pellet-clad gap fission gas inventory had also been available for release in the test, the ^{85}Kr release would have been 31.3%. Significant releases of radiogenic Rb, Cd, Ag, and Br, as well as trace amounts of Te, La, Ba, Sr, and Eu, were detected by spark-source mass spectrometric analysis. The masses of materials which were transported by carrier gas to the thermal gradient tube (TGT) and filters from the furnace and test specimen were measured by weighing. The concentrations of vapor and aerosol particulates in the gas stream were calculated from these weights.

33065 **(NUREG/CR—3613) Evaluation and acceptance of welded and repair-welded stainless steel for LWR service. Annual report for 1983.** Atteridge, D.G.; Bruemmer, S.M.; Page, R.E. (Pacific Northwest Lab., Richland, WA (USA)). Jun 1984. Contract AC06-76RL01830. 55p. (PNL—4941). NTIS, PC A04/MF A01; 1 - GPO $4.50; GPO Dep. Order Number DE84013756.

Portions are illegible in microfiche products.

Pacific Northwest Laboratory (PNL) is conducting a program to determine a method for evaluating the acceptance of welded and repair-welded stainless steel (SS) piping for light-water reactor (LWR) service. Validated models, based on experimental data, will be developed to predict the degree of sensitization (DOS) and the intergranular stress corrosion cracking (IGSCC) susceptibility in the heat-affected zone (HAZ) of the SS weldments. IGSCC is caused by a combination of a sensitized microstructure, an aggressive environment, and tensile stress. Control of any of these three factors can eliminate IGSCC in most practical situations. This program will measure and model the development of a sensitized microstructure as it pertains to welded and repair-welded SS pipe. An empirical correlation between a material's DOS and its susceptibility to IGSCC will be determined using constant extension rate tests (CERTs). The successful completion of these tasks will result in a method for assessing the effects of welding/repairing parameters on the IGSCC susceptibility of component-specific nuclear reactor welds/repairs.

33066 **(BMI—1983-009) Studies for improving PWR simulators and the training of PWR operators using simulators. Pt. 2.** Simon; Meissner; Emmerich; Hirdes; Hanke; Wagner. (Bundesministerium des Innern, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Garching (Germany, F.R.)). Sep 1983. 357pp. (In German). (GRS-A—841). NTIS (US Sales Only), PC A16/MF A01. Order Number DE84751500.

The survey describes studies on the improvement of a PWR-simulator concerning the simulation of failures and accidents, and how the operating personnel can handle them. Results gained from model tests and/or simulation of transients and accidents are illustrated and explained in detail. The knowledge gained from the evaluation of the results is presented and commented. The studies opened new perspectives for numerous improvements concerning the examined simulator and/or the training of personnel on the simulator. The results show in this survey are to be considered as recommendation for the improvement of PWR-simulators having achieved the same degree of sophistication as KWU's simulator in Karlstein. Recommendations concerning requirements on future simulators are also made. These recommendations are based on the knowledge gained from this study.

33067 **(BMI—1983-025) Consideration of loading conditions initiated by thermal transients in PWR pressure vessels.** Azodi; Glahn; Kersting; Schulz; Jansky. (Bundesministerium des Innern, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). Dec 1983. 166p. (In German). (GRS-A—872). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84751432.

This report describes the present state of PWR-plants in the Federal Republic of Germany with respect to - the design of the primary pressure boundary - the analysis of thermal transients and

resulting loads - the material conditions and neutron fluence - the requirements for protection against fast fracture. The experimental and analytical research and development programs are delineated together with some foreign R and D programs. It is shown that the parameters investigated (loading condition, crack shape and orientation etc.) cover a broad range. Extensive analytical investigations are emphasized.

From 6. international conference on nondestructive evaluation in the nuclear industry; Zurich, Switzerland (27 Nov 1983).

Portions are illegible in microfiche products.

A nondestructive testing bench is described. It is devoted to examination of high residual power fuel pencils without stress on the cladding nor interference with cooling. Guiding by fluid bearings decrease the background noise. Scanning speed is limited only by safety criteria and data acquisition configuration. Simultaneous control of various parameters is possible. Associated to an irradiation loop, loaded and unloaded in a reactor swinning pool, this bench can follow fuel pencil degradation after each irradiation cycle.

33069 **(DLCS—5000483) Shippingport Atomic Power Station. Quarterly operating report, fourth quarter 1983.** (Duquesne Light Co., Shippingport, PA (USA)). 1983. Contract AC11-76PN00292. 9p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84008164.

At the beginning of the fourth quarter of 1984, the Shippingport Atomic Power Station remained shutdown for end of life defueling and decommissioning. The reactor pit section of the canal remained full of borated water with the reactor pit gate removed for continued fuel movement. Reactor plant system inactivation and turbine plant salvage operations continued during the quarter and will continue through the first quarter of 1984. Two fuel shipments were made during the quarter: one in October and one in November. The irradiated PWR Core 2 barrel and miscellaneous refueling tools remained in storage under shielding water in the Deep Pit. On-shift casualty and emergency drills were performed during the quarter.

33070 **(EGG-TMI—6536) Plan for shipment, storage, and examination of TMI-2 fuel.** Quinn, G.J.; Engen, I.A.; Tyacke, M.J.; Reno, H.W. (EG and G Idaho, Inc., Idaho Falls (USA); EG and G, Inc., Middletown, PA (USA). Technical Integration Office). May 1984. Contract AC07-76ID01570. 68p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013084.

Portions are illegible in microfiche products.

This Plan addresses the preparation and shipment of core debris from Three Mile Island Unit 2 (TMI-2) to the Idaho National Engineering Laboratory (INEL) for receipt, storage, and examination. The Manager of the Nuclear Materials Evaluation Programs Division of EG and G Idaho, Inc. will manage two separate but integrated programs, one located at TMI (Part 1) and the other at INEL (Part 2). The Technical Integration Office (at TMI) is responsible for developing and implementing Part 1, TMI-2 Core Shipment Program. That portion of the Plan establishes coordination between TMI and INEL (and others) for shipment of core debris, and it provides the coordination by which handling systems at both locations are designed, constructed, or modified to establish and maintain system compatibility. The Technical Support Branch (at INEL) is responsible for developing and implementing Part 2, Core Activities Program. That portion of the Plan details operational and examination activities at INEL, as well as defines core-related activities planned at other DOE laboratories.

33071 **(EPRI-NP—3275-Vol.1) Causes of denting. Volume 1. Summary report. Final report.** Economy, G.; Wolfe, C.R. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Nuclear Technology Div.). May 1984. 74p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920391.

This summary report outlines the work that was performed to gain a more complete understanding of denting corrosion of steam generators in PWRs. Background laboratory and plant data on denting were compiled, reviewed and correlated to determine how various exposure conditions affect denting. Two high-temperature chemistry analytical models were reviewed and evaluated by experimental simulation of impurity concentration in the heat transfer and isothermal capsule tests. Simulation of impurity concentration for three cooling waters (lake, river, and cooling tower) was evaluated. The effects of species concentration (Cu^{++}, Cl^{-}, O_2, and H^{+}), contaminant thresholds (established by isothermal and heat transfer tests), and heat flux as indicated by superheat on denting were examined. A discussion of several pertinent observations and conclusions drawn from these tasks (as they pertain to plant operation) is presented.

33072 **(EPRI-NP—3275-Vol.2) Causes of denting. Volume 2. Laboratory test results. Final report.** Economy, G.; Smith-Magowan, D. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Nuclear Technology Div.). May 1984. 184p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920420.

Denting is the deformation of the alloy 600 heat transfer tubes at tube-tube support plate intersections in some nuclear steam generators. The purpose of this study was to review the results of all Westinghouse dent-related laboratory testing in order to derive correlations between corrosion rates and chemistry, temperature, heat flux, crevice condition, and support plate material. Chemistry considerations are the most significant of these parameters and involve the definition of the level of acid chloride in the crevice. Consideration of the relationship between this concentrated solution and the more dilute bulk environment is also provided. The principal effect of heat transfer is to concentrate, within crevices, nonvolatile contaminants that are present in the bulk. Correlation of denting with heat flux level is influenced by bulk chemistry or local thermohydraulics and thus are difficult to attribute directly to heat flux. Denting increased with temperature. Crevice condition encompassed three variables: width, packing, and shape. A minimum width was found in both isothermal and heat transfer tests, below which denting or bulging was negligible or nonsustainable beyond a marginal extent. The quatrefoil crevice shape required higher heat flux than the drilled shape to produce denting on A285 carbon steel material. Pre-packing crevices with corrosion product oxides did not profoundly alter the denting mechanism, but was adopted mainly to optimize consistency of results. The resistance to denting of different support materials was found to increase with increasing chromium content of the alloy, and 405 SS, in either the drilled or quatrefoil configuration, resisted denting.

33073 (EPRI-NP—3347-SR, pp 33.1-33.10) **Development of a finite element model for eddy current NDT phenomena.** Lord, W. (Colorado State Univ., Fort Collins). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

This work demonstrates that numerical analysis techniques can be applied to the modeling of eddy current NDT phenomena used in the examination of PWR steam generator tubes. Two-dimensional and axisymmetric code was applied to a study of differential eddy current probe impedance plane trajectories for those steam generator geometries which have axisymmetry. In a parallel study two-dimensional and axisymmetric code was developed for studying the magnetostatic fields associated with direct current probes. Work has continued in applying the axisymmetric eddy current code to additional NDT geometries, and in extending the code to the problem of modeling EC probe responses to realistic 3-D defect shapes such as pits and axial cracks. A new parametric signal processing technique, the Fourier descriptor method, has been successfully applied to the problem of classifying differential EC probe impedance plane trajectories.

33074 (EPRI-NP—3347-SR, pp 37.1-37.9) **Evaluation and transfer of steam generator NDE technology.** Brown, S.D. (J.A. Jones Applied Research Co., Charlotte, NC). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

The Center is evaluating various methods which address steam generator NDE problems: electromagnetic methods, alternate eddy current test coils, evaluation of dent profilometry techniques, and methods for detecting support plate ligament cracking.

33075 **(EPRI-NP—3461) Effects of shutdown/cooldown techniques on radiation fields in PWR primary coolant loops.** Bishop, W.N.; Stagg, W.R. (Babcock and Wilcox Co., Lynchburg, VA (USA). Lynchburg Research Center). May 1984. 86p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920390.

Includes 3 sheets of 24x reduction microfiche.

Radioactive corrosion deposited on reactor coolant system surfaces is the primary source of radiation exposure at nuclear power plants. The process of transport, activation and deposition of corrosion products involves the solubility of the corrosion products. The effect of redox agents, pH and temperature on the solubility of corrosion products was studied. The solubility of the corrosion products was calculated from thermodynamic properties. These calculations included the effects of redox agents, pH and temperature. These calculations showed that control of redox agents and pH could minimize the solubility of corrosion products during the shutdown/cooldown of nuclear plants. Based on the calculations, plant tests were conducted to demonstrate the feasibility of solubility control during shutdown. The results showed that corrosion product solubility can be controlled by a combination of redox and pH control techniques.

33076 **(EPRI-NP—3488) Fuel failures in the Connecticut Yankee reactor (Haddam Neck). Addendum to NP-2119.** Raven, L.F.A.; Howl, D.; Naylor, J.; Pitek, M.T.; Clink, L.J. (Northeast Utilities Service Co., Hartford, CT (USA)). May 1984. 52p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920415.

Significant levels of fuel rod failures were observed in the batch 8 fuel assemblies of the Connecticut Yankee reactor. Results of detailed poolside and hot cell examinations, reported earlier in NP-2119, indicated the failure mechanism was stress corrosion cracking initiating on the clad outer surface. The sources of cladding stresses were believed to be (a) fuel pellet chips wedged in the cladding gap, (b) swelling of highly nondensifying batch 8 fuel, and (c) potentially harmful effects of a power change event that occurred near the end of the second cycle of irradiation for batch 8. This report reviews the 1977-78 experience and conclusions of the earlier investigations against the background of the total operational experience of the reactor from initial startup to the present time. It provides more details on operating conditions and uses the results of SLEUTH-SEER analyses to interpret the effects of operational maneuvers. The investigation adds more evidence for the importance of the ramp effects.

33077 (IAEA-SMR—68/2, pp 1-55) **Fundamentals of pressurized water reactors.** Murray, L. (North Carolina State Univ., Raleigh (USA). Dept. of Nuclear Engineering). Jun 1982. NTIS (US Sales Only), PC A25/MF A01. Order Number TI84780440.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

In many countries, the pressurized water reactor (PWR) is the most widely used, even though it requires enrichment of the uranium to about 3% in U-235 and the moderator-coolant must be maintained at a high pressure, about 2200 pounds per square inch. The objective in this series of seven lectures is to describe the design and operating characteristics of the PWR system, discuss the reactor physics methods used to evaluate performance, examine the way fuel is consumed and produced, study the instrumentation system, review the physics measurements made during initial start-up of the reactor, and outline the administrative aspects of starting up a reactor and operating it safely and effectively.

33078 (IAEA-SMR—68/2, pp 57-70) **Fundamentals of WWER-type pressurized water reactors.** Silvennoinen, P. (Technical Research Centre of Finland, Nuclear Engineering Lab., Helsinki). Jun 1982. NTIS (US Sales Only), PC A25/MF A01. Order Number TI84780440.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

The brief series of lectures cover the fundamentals of the Soviet pressurized water reactors (WWER) including a discussion on core layout and lattice design as well as on loading patterns of the WWER-440. Special features of the calculational procedures are described and examples are given of lattice cell, power distribution and core dynamics calculations. Finally, some remarks are made on the new WWER-1000 core design.

33079 (IAEA-SMR—68/2, pp 215-278) **Operational physics of pressurized water power reactors.** Bosser, R. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Eau). Jun 1982. NTIS (US Sales Only), PC A25/MF A01. Order Number TI84780440.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

These lectures are about the physics of pressurized water power reactors. They mainly refer to the 900MWe Westinghouse reactor type; with a view to illustrating the real problems that occur on largely built and operating plants. Nevertheless, however, general questions common to all PWRs are also developed. A brief review of the power operation conditions including the utilities needs, the technical and safety limits, and the physical parameters measured to operate the reactor in a safe, reliable and efficient manner intends to introduce the origin of the problems. The measurement devices relative to the flux (power, reactivity), temperature, pressure, mass flow, boron, concentration are described in detail and the trend of development in this field is presented. Core calculations are discussed, not in detail as design calculations but more as support to the analysis of the experimental measurements. The start-up tests are described in detail in chronological order from fuel loading to full power. They include the hot zero power and the power tests. The last part concerns some operation problems such as reactor transients (the Xenon effect is developed) and load following. This work was intended to support an oral presentation of the subject and not to be self-explanatory as a written course.

(Vysoka Skola Strojni a Elektrotechnicka, Plzen (Czechoslovakia)). 1981. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780241. (CONF-8112102—Vol.1).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

In the high-pressure part of the turbine drops of moisture condensate, which causes erosion and has negative impact on the service-life of the turbine and on its thermodynamic efficiency. Various designs have been put forward to eliminate moisture. A good combination is moisture separation combined with the offtake of steam for the regeneration of feed water or for the steam reheater. As concerns the high-pressure component of the turbine it is best to offtake steam for the feed water heater and for heating the steam between the high- and low-pressure components of the turbine. The connections of the heater and re-heater in diagrams of various manufacturers are evaluated and compared. It appears to be uneconomical to use the heater in cases where feed water would be heated to temperature considerably below its optimal value. (M.D.).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

Using program VOR 1 it is possible to make steady-state hydraulic calcualtions of a generally branched pipe network. This program is used to solve initial conditions for the actual non-steady state calculation of hydraulic shock using program VOR 2. The physical flow model is one-dimensional, single-phase, pressure losses are concentrated at points of fictitious diaphragms. For numerical solution, the fictitious diaphragm method is used, which is an analogy of the graphic Schnyder-Bergeron method and the method of characteristics. A failure due to a shock may be modeled by changes in pressure, flow rate and the adjustment of the fitting at any arbitrary point in the circuit. The calculation will determine the time course of the pressure and flow rate at all points in the circuit. Selected as an example was seizing of the main circulating pump in one branch of the WWER primary circuit. (B.S.).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

An empirical correlation is presented for the computation of critical thermal flow densities derived from own measurements on models with axially even and radially even and uneven heat generation. The results are presented tested on a sample of published experimental data and correlations presented in the literature are critically evaluated. The correlation also includes the influence of axially uneven heat flow distribution on departure nucleate boiling and the measure of safety is given for the rated parameters of the WWER 1000 reactor. (J.B.).

33087 **(KFK—3658) FEBA - flooding experiments with blocked arrays. Data report 1, test series 1 through 4.** Ihle, P.; Rust, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Nukleare Sicherheit). Mar 1984. 547p. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.).

This report presents typical data and a limited heat transfer analysis of test series 1 through 4 from an experimental thermal-hydraulic program of Flooding Experiments with Blocked Arrays (FEBA). The experiments consisted of separate effect tests on a full-length 5 x 5 rod bundle of PWR fuel road dimensions utilizing electrically heated rods with a cosine power profile approximated by 7 steps of different specific power. Eight test series were performed under idealized reflood conditions using forced feed and system pressure as parameters without the inclusion of the effects of a reactor cooling system. This individual test series were conducted to study the effect of grid spacers and of coplaner blockages of different blockage ratios with and without bypass on the reflood heat transfer. The purpose of the investigations was to obtain an insight into the most important heat transfer mechanisms and to broaden the data base for the development and assessment of improved thermal-hydraulic models.

33088 **(NNC—01) Statement for Sizewell 'B' public inquiry.** (National Nuclear Corp. Ltd., London (UK)). Jul 1982. 37p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84702035.

The formation of National Nuclear Corporation Limited (NNC) is discussed together with its acquisition of staff with nuclear experience, the main contracts which it has performed or is performing, its present corporate structure and the organisation by projects and functions through which it discharges its current obligations. Information concerning NNC's experience in water reactor design and technology, its most recent contribution to assist the Government in making its decisions with respect to the type of reactor upon which the UK nuclear programme should be based, technical agreements it has reached with US organisations, the nature of the work on Sizewell B which is currently being done and the arrangements made for doing it, the implications of building Sizewell B on export prospects and on industry, and NNC's planning to anticipate the possible future requirements for PWR power stations is provided.

33089 **(GA-A—17559) Kernel migration in failed, oxide-based HTGR fuel.** Montgomery, F.C.; Partain, K.E.; Allen, H.C. (GA Technologies, Inc., San Diego, CA (USA)). May 1984. Contract AT03-84SF11962. 12p. (CONF-840614—60). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013344.

From Annual meeting of the American Nuclear Society; New Orleans, LA, USA (3 Jun 1984).

Portions are illegible in microfiche products.

Oxide-based HTGR fuel particles with artificially failed coatings have been heated in the range 1100° to 1350°C (1273 to 1623 K) to investigate the interaction of the kernel with its surrounding coating. At these temperatures, oxide-based kernels in failed TRISO-coated particles migrate due to the reaction of the oxide kernel with the surrounding carbonaceous layers. The rate of kernel migration is dependent on the time of reaction, the temperature, and the CO pressure. The temperature dependence of the migration rate suggests that migration is controlled by diffusion of oxygen across the carbide product layer. Adding CO to the cover gas reduces the rate of migration and can prohibit migration if the CO pressure exceeds the thermodynamic equilibrium value for a given reaction temperature. Because complete conversion of the oxide kernel to carbide occurs within the particle, migrating oxide-based kernels do not penetrate the silicon carbon (SiC) coating in TRISO particles. Thus, propagating particle failure caused by kernels that have breached their coatings reacting with the outer coatings of adjacent particles will not occur in the reference particle at normal high temperature gas-cooled reactor (HTGR) operating temperatures.

33090 **(ORNL/TM—8922) Regarding overrelaxation for accelerating an iteration process.** Vondy, D.R. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 37p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013626.

The solution for a vector that satisfies a set of coupled equations is often obtained economically in iteration. Application of an overrelaxation coefficient to augment the calculated iterate changes is done to accelerate the rate of convergence. This scheme is simple to implement and often effective. Much is known theoretically about the iterative behavior when the system of equations is linear, although there are complexities that are not widely known. Extensive use is made of the scheme even to non-linear systems of equations where behavior depends on the situation. Of much concern to the developer of solution methods (typically an engineer or applied mathematician) is implementing an effective procedure at a modest investment in development and testing. Applications are described to thermal cell and neutron diffusion modeling.

33091 **(RD/B/N—1500) Environmental influences on fuel burnup in Mk.III G.C.R.'s.** Ainger, P.R. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Sep 1969. 27p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84901356.

Portions are illegible in microfiche products.

An area of an equilibrium Mk.III G.C.R. core has been represented by a non-leaking supercell to examine the effect which the environment has upon the macroscopic neutron properties of the fuel. Comparisons have been made between the results of this calculation and the WIMS output with regard to variations in k ∞, rating and fast neutron damage over the fuel lifetime. The feedback effects of this environment on the changes in isotopic composition of the fuel as a function of irradiation have been examined. It is found that at any point in time most parameters of interest are significantly affected by this feedback but that when these quantities are averaged over lifetime this sensitivity is very much reduced. A theoretical explanation of this effect is included. Good agreement was obtained between reactor calculations in 2 and 9 energy groups for the irradiated supercell.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

A physical description of a CANDU reactor of the 600 MWe size is given, with particular emphasis on the core design and nuclear performance characteristics. The methodology used in the physics analysis associated with the design process is outlined, and typical results of the analysis presented. Finally, the determination of the initial fuel load is described and the physics analysis and tests associated with commissioning are summarized.

33093 (IAEA-SMR—68/2, pp 451-525) **CANDU-PHW fuel management.** Frescura, G.M.; Wight, A.L. (Nuclear Studies and Safety Dept., Ontario Hydro, Toronto (Canada)). Jun 1982. NTIS (US Sales Only), PC A25/MF A01. Order Number TI84780440.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

The report deals with fuel management in natural uranium fuelled CANDU-PHW reactors. Assuming that the reader has a basic knowledge of CANDU core physics, some of the reactor systems which are more closely related to fueling are described. This is followed by a discussion of the methods used to calculate the power distribution and perform fuel management analyses for the equilibrium core. A brief description of some computer codes used in fuel management is given, together with an overview of the calculations required to provide parameters for core design and support the accident analysis. Fuel scheduling during approach-to-equilibrium and equilibrium is discussed. Fuel management during actual reactor operation is discussed with a review of the operating experience for some of the Ontario Hydro CANDU reactors.

33094 **(HEDL-SA—3019-S) Modeling delayed neutron monitoring systems for fast breeder reactors.** Bunch, W.L.; Tang, E.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1983. Contract AC06-76FF02170. 4p. (CONF-840614—65). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013939.

From Annual meeting of the American Nuclear Society; New Orleans, LA, USA (3 Jun 1984).

The purpose of the present work was to develop a general expression relating the count rate of a delayed neutron monitoring system to the introduction rate of fission fragments into the sodium coolant of a fast breeder reactor. Most fast breeder reactors include a system for detecting the presence of breached fuel that permits contact between the sodium coolant and the mixed oxide fuel. These systems monitor for the presence of fission fragments in the sodium that emit delayed neutrons. For operational reasons, the goal is to relate the count rate of the delayed neutron monitor to the condition of the breach in order that appropriate action might be taken.

33095 **(HEDL-SA—3049) N-47 postprocessor for high temperature inelastic analyses.** Hubel, H.; Weiner, E.O. (Hanford Engineering Development Lab., Richland, WA (USA); Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). 1984. Contract AC06-76FF02170. 11p. (CONF-840831—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84006352.

From ASME international computers in engineering conference; Las Vegas, NV, USA (12 Aug 1984).

Portions are illegible in microfiche products.

A computer program, CPROC, has been designed to conduct high temperature evaluations of inelastic strain and creep-fatigue damage accumulations per T-1310 and T-1420 of the ASME N-47 code case. A sequential data base, generated by an inelastic analysis with a finite element program, is read in a single pass. Currently, the data base may be created with the POST option or the ELEVAR user routine in the MARC finite element system. The assumed data base structure is general enough to admit most MARC element types. Adjustments may be made for missing direct stress components, a situation common to shell and beam elements. Reading of an ADINA PORTHOLE data base is possible. Also, small problems without a data base may have the necessary data input directly by the user. User input includes section definitions and fatigue cycle definitions. Stress rupture and fatigue data may be entered by the user, or built-in data for 304SS and 316SS may be invoked. Section strains and creep-fatigue damage values are printed at user-specified places and time, and end-of-life extrapolations are performed. A negative design margin summary is provided. An option is provided for printing stress and strain components. Almost any printed variable may be plotted with linear or logarithmic axis.

(CONF-820590—Summ.).

From International working group on fast reactors specialists' meeting on sodium fires, design and testing; Richland, WA, USA (24 May 1982).

Considerations of sodium fires are very important for the design and licensing of LMFBRs. Continuing effort has been made in the study of sodium fires and their consequences since the beginning of the Japanese fast breeder reactor development program. Recent effort is mainly focussed on studies related to Monju, especially on the design and testing of primary cell liners against large sodium spills. Experimental and analytical studies on sodium fires, water release from concrete and sodium concrete reactions are conducted as a part of this study. Some extinguishing agents are also tested against sodium fires. In addition, considerable effort is being made in the development of detection systems for the small sodium leaks before a pipe rupture. This paper briefly summarizes the Japanese status of these sodium fire related activities conducted by Fast Breeder Reactor Development Project of the Power Reactor and Nuclear Fuel Development Corporation (PNC).

33111 (JAERI-M—83-050) **Single-fluid-type accelerator molten-salt breeder (AMSB).** Furukawa, Kazuo; Tsukada, Kineo. (Japan Atomic Energy Research Inst., Tokyo). Mar 1983. 48p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84702036.

The applications of molten-salt target and blanket to the Accelerator Molten-Salt Breeder (AMSB) are discussed, where the molten fluorides including ThF_4 or UF_4 in high concentration are utilized. This concept naturally has several significant benefits relating to the target fabrication, design, radiation damage, heat removal, safety, and economy. Until now, a poor spallation neutron yield was mentioned as a severe fault. However, according to the results of neutronics calculation performed on the molten-salt system such as LiF-BeF_2-ThF_4, LiF-NaF-ThF_4, LiF-BeF_2-UF_4 etc., their neutron yields have been found comparable with or superior to the values for heavy metal target such as Bi and Pb, assuring the high performance of AMSB. The schematic figures of AMSB are shown together with the several tables and figures of their neutronics calculation models, neutron yields, and predicted performances. Neutronics calculations have been performed with the use of NMTC/JAERI modified to include fission processes, TWOTRAN-II and other auxiliary codes. The spatial and energy distributions of neutrons have been also calculated. The chemical aspects of spallation products in these facilities have been examined and are believed to be practically manageable in processing. The energy strategical positions of AMSB have been discussed, one of which is the application for producing ^{233}U fuels. This may contribute to the early initiation of self-sustaining Th fuel cycle.

From Materials for future energy systems conference; Washington, DC, USA (1 May 1984).

Portions are illegible in microfiche products.

Sufficient data exist to provide a high level of confidence that refractory-alloy-clad ceramic fuel pins and refractory structural alloys can be used successfully in an operational space power system. However, data are not yet sufficient to ensure that these materials can meet the temperature, lifetime, and system mass envelope requirements for reliable operation of a 100 kW(e) system as specified by the SP-100 Project. Development efforts to provide these data are being initiated.

33114 (LA-UR—84-1480) **Low power unattended defense reactor.** Kirchner, W.L.; Meier, K.L. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 8p. (CONF-840804—19). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012641.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

A small, low power, passive, nuclear reactor electric power supply has been designed for unattended defense applications. Through innovative utilization of existing proven technologies and components, a highly reliable, walk-away safe design has been obtained. Operating at a thermal power level of 200 kWt, the reactor uses low enrichment uranium fuel in a graphite block core to generate heat that is transferred through heat pipes to a thermoelectric (TE) converter. Waste heat is removed from the TEs by circulation of ambient air. Because such a power supply offers the promise of minimal operation and maintenance (O and M) costs as well as no fuel logistics, it is particularly attractive for remote, unattended applications such as the North Warning System.

2107 Regulation And Licensing

33116 **Imposing specific directives on the Bonneville Power Administration. Hearings before the Committee on Energy and Natural Resources, United States Senate, Ninety-Eighth Congress, First Session, on S. 1701, August 3, 1983.** Washington, DC; Government Printing Office (1984). 539p.

Hearings in Seattle and Washington, DC considered S. 1701 (identical to section 317 of H.R. 3363) relating to the Washington Public Power Supply System (WPPSS) No. 1, 2, and 3 units. The bill clarifies the Bonneville Power Administration's (BPA's) authority to seek alternative financing for construction and states the limitations for seeking public funds through appropriations or municipal bonds. Seventy witnesses presented the views of state officials, utilities, consumers, industry, and labor. Of particular concern were the possibilities of bankruptcy and unemployment for Washington State. The hearing record includes the text of S. 1701, the testimony, and additional material submitted for the record.

2109 Process Heat Reactors

33117 **(GA-A—17495) Modular reactor: a deployment strategy for the long-term HTGR goal of very high temperature operation.** McDonald, C.F. (GA Technologies, Inc., San Diego, CA (USA)). Apr 1984. Contract AT03-76SF70046. 9p. (CONF-840804—5). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011154.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

From the onset of high temperature gas-cooled reactor (HTGR) activities in the 1950s, the ultimate application of very high temperature operation for process heat use was recognized. It was clear, however, that reactor operation, perhaps as high as 1000°C (1832°F), could only evolve from plant operational experience at steam cycle conditions of 700°C (1292°F), together with the development of materials and components for elevated temperature service. When developed, it is projected that the very high temperature reactor (VHTR) will meet the needs of the synthetic fuel industry in the early decades of the 21st century. This paper highlights an orderly deployment strategy for advancing from an established reactor technology base to VHTR operation. 18 references.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This document provides the Design and Technology Development Plan for the two Modular Reactor Systems (MRS) being studied: a HTGR-MRS-Reformer system to convert methane gas to synthesis gas (H_2 and CO) and also generate electric power, and an HTGR-MRS-Steam Cycle system to supply direct steam for electric power generators and/or process heat. The specific systems addressed by this plan consist of reactor fuel, reactor system, lower vessel, upper vessel reformer, upper vessel steam cycle, and the balance of plant. Base technology areas addressed are reformer catalyst, coolant chemistry, materials, and safety and licensing.

33120 **(EPRI-NP—3489) Validation of resonance-shielding procedures for reactor cell analysis.** Rothenstein, W. (Technion-Israel Inst. of Tech., Haifa. Dept. of Nuclear Engineering). May 1984. 49p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920417.

A special procedure has been developed to determine the effect of the OZMA transport calculations on the EPRICELL results. It consists of matching the OZMA resonance reaction fractions within EPRICELL by iteratively adjusting the EPRICELL cross sections. The resulting group cross sections and integral parameters can be compared directly with the ones calculated by the standard EPRICELL treatments. Benchmark calculations have been made with both codes. Results are compared in the report and discussed both as regards the information they yield about the adequacy of the EPRICELL resonance treatment and in connection with the extent to which OZMA results can be used to formulate empirical corrections to this treatment in the individual resonance groups. Good overall agreement was obtained between the EPRICELL and OZMA results in the epithermal resonance groups, when options developed for using the ENDF/B-V library within EPRICELL are utilized.

The researches programs developed at IEN (Instituto de Engenharia Nuclear) during the year of 1982, are described. Researches are developed in the field of Reactor Physics, Radiation Protection, Chemistry, Nuclear Power Plants, Materials and Metallurgy, Instrumentation and Control. (E.G.).

33141 **(PB—84-169606) Continued development of the QUANDRY code. Final report.** Henry, A.F.; Finck, P.; Joo, H.S.; Khalil, H.; Parsons, K. (Massachusetts Inst. of Tech., Cambridge (USA). Energy Lab.). Jan 1984. 69p. (MIT/EL—84-001). NTIS, PC A04/MF A01.
Sponsored in part by Consolidated Edison Co. of New York, Inc., New York, Northeast Utilities Service Co., Hartford, CT., Pacific Gas and Electric Co., San Francisco, CA., and Public Service Electric and Gas Research Corp., Newark, NJ.
The general goal of the work carried out has been to develop and test a method for predicting detailed power history throughout the lifetime of a light water moderated power reactor. The authors have based the scheme on the two-group nodal code QUANDRY, and the present work has been concerned with testing and refining that code so that it can be used to predict accurate values for local fuel-pin power throughout reactor lifetime in a straightforward, economical manner.

33142 **(UTRCN-G—11) Report of progress of research by common use of facilities in JAERI, 1981.** (Tokyo Univ. (Japan). Research Center for Nuclear Science and Technology). 1982. 401p. (In Japanese). NTIS (US Sales Only), PC A18/MF A01. Order Number DE84702050.
In fiscal 1981, the common utilization of the facilities in the Japan Atomic Energy Research Institute with universities has achieved spectacular results by the efforts of those concerned. This report is published by collecting these results. The role of universities in the society is to train personnel and to do pioneering and fundamental research. In order to establish the total system of atomic energy having safety, reliability and economic efficiency, much more research and development are required. This is being pursued by the cooperative efforts of JAERI and universities. In order to develop this common utilization of facilities further, the expansion of research program to neutron diffraction and the irradiation experiment on living system, the increase of traveling expense for researchers, the expansion of the building for the common utilization, and the increase of managing personnel are necessary. The results of general research and cooperation research are reported.

33143 **Generalized quasi-static method for nuclear reactor space-time kinetics.** Devooght, J.; Mund, E. (Universite Libre de Bruxelles, Service de Metrologie Nucleaire Avenue Franklin Roosevelt, 50, B-1050, Bruxelles). *Nuclear Science and Engineering;* **76**: No. 1, 10-17(Oct 1980).
A generalization of the classical quasi-static method is described. "Amplitude" and "shape" functions are treated on the same footing by applying an iterative Newton method to the integral form of the multigroup diffusion equations. Provision is made for one amplitude function per neutron group. It is shown, further, how this model encompasses Ott and Meneley's improved quasi-static algorithm.

33144 **Comparison of the order of approximation in several spatial difference schemes for the discrete-ordinates transport equation in one-dimensional plane geometry.** Lee, S.M.; Vaidyanathan, R. (Reactor Research Centre, Kalpakkam Tamil Nadu). *Nuclear Science and Engineering;* **76**: No. 1, 1-9(Oct 1980).
A systematic comparison has been made of the local difference operator approximation in spatial difference schemes for the solution of the transport equation in slab geometry by the method of discrete ordinates. The truncation error in different schemes varies according to the nature of the intra-mesh source and flux interpolation, and this explains the good performance of certain recently proposed schemes. The authors have classified the schemes according to the nature of the intra-mesh source interpolation. As a general principle, they find that in each class, the scheme that conserves the spatial moments of source calculated from the previous iteration and avoids flux interpolation is the most accurate.

33145 **Homogenized diffusion approximations to the neutron transport equation.** Larsen, E.W.; Hughes, R.P. (University of California, Los Alamos Scientific Laboratory Theoretical Division, Los Alamos, New Mexico 87545). *Nuclear Science and Engineering;* **73**: No. 3, 274-285(Mar 1980).

A general problem of time-dependent neutron transport in a spatially heterogeneous medium is analyzed by two perturbation methods that have previously been applied to specialized problems. These "bucking" and "asymptotic" methods are shown to be equivalent in the sense that the asymptotic method leads to a time-dependent diffusion equation with constant coefficients, whereas the buckling method leads to the corresponding dispersion law. Two applications, the calculation of k /SUB eff/ , and the derivation of a point reactor model are given. Also, the general results obtained here are shown, in several special cases, to reduce to the simpler results obtained previously.

33146 **Comments on higher order generalized perturbation theory.** Gandini, A. (Comitato Nazionale per l'Energia Nucleare Casella Postale 2358, Rome). *Nuclear Science and Engineering;* **73**: No. 3, 289-294(Mar 1980).

Higher order generalized perturbative formulations are derived in relation to linear functionals for systems at generally non-stationary conditions, starting from perturbative expressions of the density function. Formulations relevant to stationary shielding problems are finally simply obtained as particular cases.

33147 **Time-dependent generalized perturbation theory for coupled neutron-nuclide problems.** Greenspan, E.; Marable, J.H.; Williams, M.L. (Oak Ridge National Laboratory Engineering Physics Division, P.O. Box X Oak Ridge, Tennessee 37830). *Nuclear Science and Engineering;* **73**: No. 2, 210-218(Feb 1980).

A generalized time-dependent nonlinear perturbation theory for coupled fields of neutrons, nuclides, and delayed neutron precursors is presented in a unified, yet detailed, formulation for diverse areas of applications, including depletion analysis, xenon poisoning, reactor kinetics, and pulsed neutron problems. Several applications of this formulation are discussed including cross-section sensitivity analysis and reactor design and operation sensitivity analysis.

33148 **A rigorous treatment of transverse buckling effects in two-dimensional neutron transport computations.** Blomquist, R.N.; Lewis, E.E. (Northwestern University, Nuclear Engineering Program, The Technological Institute Evanston, Illinois 60201). *Nuclear Science and Engineering;* **73**: No. 2, 125-139(Feb 1980).

The variational formulation of the even-parity form of the within-group neutron transport equation is generalized to include complex trial functions. The introduction of transverse leakage effects through the buckling term exp(iB X r) leads, in general, to a coupled set of Euler equations for the real and imaginary even-parity flux components. The coupling between real and imaginary flux components is retained in both discrete-ordinates and finite element angular approximations. Employment of the spherical harmonics approximations in angle, however, leads to an uncoupled set of Euler equations if an appropriate choice of axes is made. Hence, a rigorous buckling treatment of third-dimensional leakage can be incorporated into two-dimensional transport computations without solving for the imaginary flux component. The foregoing spherical harmonic formulation is combined with finite element discretization in space in the multigroup criticality code FESH. One- and multigroup results are presented to demonstrate the elimination of ray effects and to examine the errors introduced by the DB^2 leakage correction used in conventional transport calculations.

33149 **Neutron spectra from monoenergetic source neutrons after multiple reflection between plane-parallel concrete interfaces.** Hagan, W.K.; Simmons, G.L. (Science Applications, Inc. 1200 Prospect Street La Jolla, California 92038). *Nuclear Science and Engineering;* **73**: No. 1, 35-41(Jan 1980).

Monte Carlo calculations have been performed for neutrons reflecting between two Type 04 concrete plane-parallel interfaces. A new 23-group albedo data base (SAIL) was used in conjunction with the MORSE code to calculate the neutron spectrum at each reflection. It was found that, after thermalization, for the same order of reflection, the number of neutrons in the cavity is dependent on the initial energy of the neutrons. Typical results are presented along with a brief history of the motivations for these calculations.

33150 **Convergence rates of spatial difference equations for the discrete-ordinates neutron transport equations in slab geometry.** Larsen, E.W.; Miller, W.F. (University of California, Los Alamos Scientific Laboratory, Theoretical Division P.O. Box 1663, Los Alamos, New Mexico 87545). *Nuclear Science and Engineering;* **73**: No. 1, 76-83(Jan 1980).

The order of convergence, as the spatial cell widths tend to zero, is derived for six numerical methods that have been proposed for the slab geometry, mulitgroup, discreteordinates neutron transport equations. The authors' results, which in two cases differ from earlier experimental results, are illustrated by means of a simple test problem.

A rate-type creep law is implemented into the computer code TEMP-STRESS for high temperature concrete analysis. The disposition of temperature, pore pressure and moisture for the particular structure in question is provided as input for the thermo-mechanical code. The loss of moisture from concrete also induces material shrinkage which is accounted for in the analytical model. Examples are given to illustrate the numerical results.

33152 **(EDF—82-H-338-449) Nondestructive testing: a bidimensional model for defect detection by eddy current testing.** Rose, C. (Electricite de France, 92 - Clamart). Sep 1982. 30p. (In French). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751584.

Portions are illegible in microfiche products.

The program presented in this paper calculates the induced e.m.f in the two coils of the probe moving inside the tube of a steam generator. The difference between these two e.m.f shows a defect, a modification of the tube geometry or the presence of the end plate.

33153 **(EPRI-NP—3347-SR, pp 7.1-7.9) Long-term inspection requirements for nuclear power plant components.** Umino, D.T. (Nutech Engineers, Inc., San Jose, CA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Progress in 1983 includes the completion of studies on the basis for Inservice Inspection intervals for several components. The project was highlighted by efforts on the primary coolant pump casings and pump casing welds. The ASME Section XI rules allow a 10-year deferred interval of the visual examination of the pump casing inside surfaces and the radiographic examination of pump casing welds. This study concluded that further deferral of these examinations is justified on the basis of: (1) a bounding worst case generic fracture mechanics analysis; (2) the radiography and visual inspection completed on four units of the thick-wall, Type F pump casings, which indicate no detected flaw growth or change; and (3) the good operating performance of pump casings to date. Additional work has been completed on the pressurizer and steam generator nozzle-to-vessel welds and nozzle inside radius. The study shows

that justification to change the inspection interval is not supported on a generic basis, since the analysis shows a relatively high potential for flaw initiation and growth. In addition, service history indicated that feedwater nozzle regions have commonly experienced considerable flaw growth due to thermal fatigue. This does not preclude the justification of individual nozzles based on plate unique data.

33154 (EPRI-NP—3347-SR, pp 10.1-10.6) **Demonstration of scanning techniques for IGSCC sizing.** Fleming, M.F.; Rowland, C.B. (Amdata Systems, Inc., San Jose, CA; Dynacon Systems, Inc., Concord, CA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Three pipe samples are being evaluated by three independant contractors: Amdata Systems, Inc., of San Jose, California; Dynacon Systems, Inc., of Concord, California; and Spectron Development Laboratories of Seattle, Washington. Techniques being utilized include analysis on and off the power-plant site. On-site analysis includes use of data-acquisition and recording equipment, while off-site backup analysis of the recorded waveforms provides more adaptable, comprehensive analysis as required to accomplish the desired confidence in NDE results.

33155 (EPRI-NP—3347-SR, pp 13.1-13.6) **Development of signal processing techniques for automated crack sizing.** Singh, G.P. (Southwest Research Inst., San Antonio, TX). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Objective of this project is to develop signal processing techniques for automated sizing of cracks in the heat-affected zone of austenitic stainless steel pipe weldments. Five signal processing techniques that utilize information from a physically based and field proven satellite-pulse technique are being developed and evaluated for providing more reliable and automated sizing of IGSCC in the heat-affected zone of austenitic stainless steel pipe weldments. The five techniques are temporal and spatial averaging, moving window analysis, spectral analysis, cepstral analysis, and isometric data plots. This project was begun in August 1983 and will be completed in February 1984.

33156 (EPRI-NP—3347-SR, pp 14.1-14.5) **Ultrasonic scattering from intergranular stress corrosion cracks: derivation and application of theory.** Thompson, R.B.; Achenbach, J.D. . (Ames Lab., IA; Northwestern Univ., Evanston, IL). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Intergranular stress corrosion cracking (IGSCC) is a major degradation mechanism in nuclear power plant stainless steel piping. Ultrasonic techniques are presently used to detect and size these cracks. However, performance is limited by the complex nature of the signals reflected from these multiple branched and faceted reflectors. Improved UT equipment and techniques are presently under development by EPRI. In support of that effort, models are reported here which relate the ultrasonic signals from those complex reflectors to their geometrical properties. The models will then be used as a tool in evaluating, refining, and optimizing the advanced techniques.

33157 (EPRI-NP—3347-SR, pp 15.1-15.11) **Development of scanners and booted ultrasonic search units for inspection of nuclear safety class piping.** Fleming, M.F.; Jacobs, B.M. (Amdata Systems, Inc., San Jose, CA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

The primary objective of the T101-4 project has been the development of automated, remotely controlled scanner mechanisms for the inspection of welds in nuclear safety class piping systems. Another important objective has been the development of booted ultrasonic search units. Together, these scanners and search units can significantly improve the accuracy and repeatability of the ultrasonic data obtained during plant inspections.

33158 (EPRI-NP—3347-SR, pp 16.1-16.6) **Evaluation of nondestructive examinations of intergranular stress corrosion cracking countermeasures.** Beverly, R.L. (Southwest Research Inst., San Antonio, TX). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Countermeasures have been developed for Type 304 stainless steel piping welds to prevent or mitigate the effects of intergranular stress corrosion cracking (IGSCC). However, application of some types of countermeasures may have a detrimental effect on the reliability of ultrasonic testing (UT) techniques required by code and regulatory inservice inspection programs. This program evaluated the effect of backlay cladding (BLC) and induction heating stress improvement (IHSI) countermeasures on the reliability of manual, conventional UT techniques for detection, location, and sizing of IGSCC flaws.

33159 (EPRI-NP—3347-SR, pp 20.1-20.10) **Development of semiautomatic weld crown contouring machine.** Shaw, C.P. (Sigma Research, Inc., Richland, WA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Regulatory and code requirements call for ultrasonic inspection of Class I and II pipe welds in nuclear power-generating plants; however, these techniques require a smooth surface for proper alignment and orientation of the transducer. To produce a suitable finish, weld crowns are contoured by hand-grinding, a laborious process that increases costs and, in operating plants, manrem accumulation. In 1978, EPRI initiated project T 120-1 with the objective of automating the contouring procedure. The prototype was demonstrated successfully under laboratory and field conditions and in vertical and horizontal applications.

33160 (EPRI-NP—3347-SR, pp 23.1-23.18) **Development of a production prototype pressure vessel imaging system.** Neeley, V.I. (Sigma Industrial Systems, Inc., Richland, WA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Integrity of weldments in nuclear reactor Pressure vessels is verified by a pulse-echo ultrasonic (UT) inspection. The Pressure Vessel Imaging System (PVIS) developed by Sigma Industrial Systems, Inc., and its subcontractors (Battelle-Northwest and Southwest Research Institute) represents a transition from the development phase to the prototype production stage. Sigma was responsible for overall project management and developed the holographic signal processor and system interface unit; Battelle-Northwest provided computer hardware and software; and SRI supplied the holographic scanner, controller, and supporting components.

33161 (EPRI-NP—3347-SR, pp 25.1-25.8) **Single Frequency Eddy Current Analysis Program.** Craig, J.N. (General Research Corp., McLean, VA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

The reliable detection and sizing of steam generator cooling tube defects is a major concern of the nuclear power industry.

Present methods are labor intensive and subjective, requiring operator analysis of lissajous patterns displayed on an oscilloscope. The SFPEC program represents an initial attempt at automating the inspection analysis process. An integrated system incorporating data acquisition and analysis functions has been developed. The feasibility of using sophisticated ALN classifiers and defect sizing algorithms has been demonstrated. Overall performance of the algorithms is good, with many possibilities for future improvements. The SFEC system should prove to be a flexible research tool useful in developing and using new techniques for eddy current signal processing and analysis.

33162 (EPRI-NP—3347-SR, pp 26.1-26.9) **Definition of Section XI ultrasonic techniques: the design and manufacture of NDE qualification blocks.** Cole, N.C.; McDearman, W.R. (Combustion Engineering, Inc., Chattanooga, TN). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

A matrix of qualification blocks has been designed to establish the capability to detect near-surface and in-depth flaws. A portion of the near-surface blocks has already been built as screening blocks for feasibility studies. These screening blocks contain crack-like flaws and are weld clad using processes typical of those found in older reactor pressure vessels.

33163 (EPRI-NP—3347-SR, pp 27.1-27.8) **Ultrasonic signal processing for characterization of under-clad flaws in pressure vessels.** Shankar, R. (Tetra Tech., Inc., Arlington, VA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

This project concentrated on developing automatic signal processing methods for flaw depth sizing using ultrasonic digital data collected under specifications developed under a previous program. The methods for sizing flaws were developed from first generating the flaw-echo dynamic curve, which is a plot of the time of flight versus transducer position on the clad surface, and then automatically analyzing the curve to determine flaw depth.

33164 (EPRI-NP—3347-SR, pp 28.1-28.7) **Evaluation and development of improved crack detection techniques.** Pade, E.R. (Westinghouse Electric Corp., Pittsburgh, PA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Recent events in the nuclear power industry have emphasized the need for improved inspection capabilities for reactor pressure vessels. These events include the issuance of Regulatory Guide 1.150, the concern expressed over pressurized thermal shock, and the complexity of the TMI-2 recovery effort. Such events illustrate the need to develop improved techniques for underclad and in-depth crack detection and to provide statistically verifiable and convincing means for demonstrating new technique capability.

33165 (EPRI-NP—3347-SR, pp 29.1-29.9) **Evaluation of the Ultrasonic Data Recording and Processing System (UDRPS).** Moore, M.J. (Dynacon Systems, Inc., Concord, CA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

An Ultrasonic Data Recording and Processing System (UDRPS) has been built under a contract between Dynacon Systems, Inc. and the Pacific Gas and Electric Company. The UDRPS equipment and technology presents a potentially powerful tool for improved, more reliable, and repeatable ultrasonic inspections of nuclear reactor pressure vessels at higher scan rates than conventional techniques. As the UDRPS techniques had not been evaluated, and performance was not known, the objectives of this project are to: (1) tailor the UDRPS equipment for evaluation at the EPRI NDE Center in Charlotte, North Carolina; (2) prepare an evaluation plan for UDRPS; (3) conduct evaluation tests of UDRPS; (4) provide quantitative and qualitative evaluation results; and (5) recommend improvements to the UDRPS equipment if the UDRPS techniques proved useful.

33166 (EPRI-NP—3347-SR, pp 30.1-30.14) **Detection of stress corrosion cracks in reactor pressure vessel and primary coolant system anchor studs.** Light, G.M.; Jolly, W.D.; Reed, D. (Southwest Research Institute, San Antonio, TX). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Previously, three anchor studs without heater h/lesin tHe reactor pressure vessel (RPV) hold-down system at a nuclear power plant had failed. The failure created uncertainty about the capabilities of conventional NDT to detect cracks in these studs, which measured over 7 feet (213 cm) in length with a 2.5-inch (6.3 cm) diameter. The cause of failure was established as stress corrosion cracking (SCC); the critical crack size was approximately 0.12 inch (0.3 cm), and the initial part of the cracks was confirmed as intergranular in nature. A sharp transition from intergranular to transgranular cleavage had occurred at the fracture line. The major inspection problem was determined to be inspecting longer studs that have no heater hole extending down the center of the stud. The conventional 0-deg inspection had difficulty principally because of attenuation, and the angle-beam technique could not be applied because the stud lacked a heater hole. In response, the CGWT was developed to inspect the studs considered uninspectable using the two mentioned techniques. The two conventional techniques used today in nuclear power plants to inspect studs with heater holes are discussed followed by a discussion of the new CGWT technique.

33167 (EPRI-NP—3347-SR, pp 31.1-31.8) **Bolt inspection by acoustic resonance.** Cole, H.A. Jr. (Randomdec Computers, Los Altos, CA). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Two samples, a standard bar and Southwest Research Bolt No. 3 which had an IGSCC defect, were driven in the longitudinal direction with conventional shaker equipent. The purpose of the test was to find a measurement which would be sensitive to crack defects for possible use in the required inspection process. Several promising measurements were found. The first was lateral vibration of the end of the bolt which underwent a large shift in direction when the wave length of excitation was approximately equal to the distance of the flaw from the end. The second was random vibration at the end of the bolt near the periphery which changed significantly at the approximate angular position of the flaw.

33168 (EPRI-NP—3347-SR, pp 40.1-40.7) **Prototype system for ultrasonic inspection of turbine disc-rims.** Singh, G.P. (Southwest Research Inst., San Antonio, TX). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, Ca 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

Development of a prototype system for the ultrasonic examination of the turbine disc-rim area (RP 1398-13) was initiated by EPRI in May 1983. The ultrasonic examin ation method offers several advantages over the conventionally applied magnetic particle method. These include in situ examination without destructive blade removal at a rapid examination speed, thus resulting in substantial savings in terms of replacement blade cost, blade removal and installation cost, and shroud-band machining cost. A system consisting of a mechanized scanner, an ultrasonic pulser-receiver with 3-gate and peak detector modules, and a 4-channel strip chart recorder has been designed. Mechanical scanner parts are being fabricated. Notches of various dimensions have been machined in a

section of a rotor disc rim to develop the crack sizing approach. Several ultrasonic techniques are in the process of evaluation for crack sizing purposes.

33169 (EPRI-NP—3347-SR, pp 41.1-41.7) **Initial evaluation of annular array technology for use in turbine disc inspection.** Light, G.M.; Mueller, T.A.; Allen, T.L. Jr.; Bloom, E.A. (Southwest Research Inst., San Antonio, TX). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, Ca 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

For the 1983 EPRI program, SwRI has constructed a 25-channel pulser/receiver system based upon concepts evaluated in the prototype system as well as in internally funded research. A 25-element, segmented annular-array transducer with better than 30 dB isolation between elements was also fabricated. The 25-channel system will utilize hybrid pulser preamps to make the total system smaller and easier to apply in the field. The system (transducer and electronics) will be available for testing with the turbine test bed developed under RP 1803-5 by the end of 1983.

33170 (EPRI-NP—3347-SR, pp 49.1-49.19) **EPRI NDE Center.** Nemzek, T.A. (J.A. Jones Applied Research Co., Charlotte, NC). Mar 1984. Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, Ca 94303. Order Number TI84920314. (CONF-8311171—).

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

The EPRI NDE Center was established in 1979 to provide improved and field-qualified nondestructive evaluation equipment, procedures, and personnel training to the utility industry. The activities of the Center are categorized as technology transfer and training and human resource development. Significant progress was achieved during the last year in the areas of steam generator tube inspection, BWR stainless steel pipe inspection, steam turbine inspection, heavy section inspection, signal processing and computer support, and training and human resource development. Major accomplishments were: publication of a document on guidelines for NDE of steam generators, providing assistance and guidance to utilities in responding to regulatory guides 82-03 and 83-02 regarding demonstration of effectiveness of ultrasonic inspection of BWR stainless steel pipe welds; verification of EPRI developed rotor inspection and lifetime prediction technology, demonstration of advanced ultrasonic methods for detecting and sizing defects under the cladding of reactor pressure vessels, and development and teaching of courses in detection and classification of IGSCC in BWR piping.

33171 **(EPRI-NP—3514) ATHOS and FLOW3 simulation of the FRIGG heated rod bundle experiment. Final report.** Heistand, J.W.; Thakkar, J.G. (Combustion Engineering, Inc., Chattanooga, TN (USA). Chattanooga Nuclear Operations). May 1984. 83p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920399.

Void fractions within the Swedish FRIGG experiment were computed with the ATHOS and FLOW3 codes and compared with each other and against measured data. The experimental model consisted of 36 electrically heated rods, each with a heated length of 4.365 m (14.32 ft) and a 13.8 mm (0.54 in.) outer diameter. Heat flux in the simulations ranged from 4.52×10^5 to 8.15×10^5 w/m^2. One transient and four steady state cases were simulated. Resistance factors, inlet geometry, computational grid, and code options were varied in additional base case simulations with ATHOS, while different void fraction correlations were used with the base case model with FLOW3. The ATHOS simulation was three-dimensional, the FLOW3 simulation two-dimensional. Numerous plots comparing the measured and calculated results are provided. In general, agreement between the simulations and the measured results was good, with ATHOS results slightly better. Parametric variation also produced expected qualitative changes. Variations among the results in different cross section zones made trends hard to establish. Experimental data on regional flow rate would have been helpful in interpreting results.

33177 **(NUREG/CR—3391-Vol.3) LWR pressure vessel surveillance dosimetry improvement program. Volume 3. 1983 annual report, October 1, 1982-September 30, 1983.** McElroy, W.N.; Kam, F.B.K.; Grundl, J.A.; McGarry, E.D.; Fabry, A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1984. Contract AC06-76FF02170. 200p. (HEDL-TME—83-23). NTIS, PC A09/MF A01; 1 - GPO $6.00; GPO Dep. Order Number DE84013503.

Portions are illegible in microfiche products.

This report describes progress made in the Light Water Reactor Pressure Vessel Surveillance Dosimetry Improvement Program (LWR-PV-SDIP) during FY 1983. The primary concern of this program is to improve, test, verify, and standardize the physics-dosimetry-metallurgy and the associated reactor and damage analysis procedures and data used for predicting the integrated effects of neutron exposure to LWR pressure vessels and support structures. These procedures and data are being recommended in a new and updated set of ASTM standards being prepared, tested, and verified by program participants. These standards, together with parts of the US Code of Federal Regulations and ASME codes, are needed and used for the assessment and control of the condition of LWR pressure vessels and support structures during the 30- to 60-year lifetime of a nuclear power plant.

33178 **(NUREG/CR—3391-Vol.4) LWR pressure vessel surveillance dosimetry improvement program. Quarterly progress report, October 1983-December 1983.** Lippincott, E.P.; McElroy, W.N. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1984. Contract AC06-76FF02170. 91p. NTIS, PC A05/MF A01 - GPO $4.50. Order Number DE84014091.

Portions are illegible in microfiche products.

In order to achieve reliable surveillance dosimetry for pressure vessels in light water reactors, it is necessary to perform sensor calibration, other dosimetry reference measurements, and validation of transport calculation in benchmark and test region neutron fields. One element in this effort is the development of a compendium of experimental and calculated dosimetry-related information for these fields. The first two entries in this compendium, the ^{252}Cf and ^{235}U fission spectrum standard fields, were completed in 1978. The revi-

sion given in this Progress Report provides updated facility information and evaluated dosimetry cross sections with a cut-off date of June 1983.

33179 **(NUREG/CR—3630) Equipment qualification methodology research: tests of pressure switches.** Salazar, E.A. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1984. Contract AC04-76DP00789. 181p. (SAND—83-2652). NTIS, PC A09/MF A01; 1 - GPO; GPO Dep. Order Number DE84012931.

Portions are illegible in microfiche products.

Pressure switches, two each of five different models from two manufacturers, were tested in baseline evaluation tests typical of IEEE-323 (1974) suggested profiles as part of the NRC-sponsored Equipment Qualification Methodology Research Test Program (A-1355). The tests incorporated generic seismic and loss-of-coolant accident (LOCA) environments to assess the functional capabilities of unaged equipment. During the baseline evaluation tests, the seismic environment did not affect the functionality of the pressure switches, but the LOCA physical damage in four of five models tested. As a result, eight other switches of the same make and model as those used in the baseline evaluation tests were tested in a follow-up test. In the follow-up test (a discrete-step pressure ramp LOCA environment) erratic functional behavior or complete failure was observed in all the equipment early in the test.

33180 **(NUREG/CR—3671) Assessment of radiation effects relating to reactor pressure vessel cladding.** Corwin, W.R. (Oak Ridge National Lab., TN (USA)). Jul 1984. Contract AC05-84OR21400. 62p. (ORNL—6047). NTIS, PC A04/MF A01; 1 - GPO; GPO Dep. Order Number DE84013925.

Portions are illegible in microfiche products.

Because the weld overlay cladding on the interior of light-water reactor pressure vessels was applied for corrosion resistance and not for structure, little attention has been given to the potential of mechanical property degradation due to radiation exposure. In light of the concerns recently raised regarding overcooling transients in nuclear power reactors, it has been suggested that any such degradation could adversely affect the serviceability and/or integrity of the vessel. A literature survey assesses the current knowledge regarding the effects of neutron radiation on the mechanical and fracture properties of stainless steel weld overlay cladding under conditions relevant to light-water reactor operation. In particular, effects on the material's microstructure and tensile, fatigue, impact, and fracture properties are examined. Although information is lacking on the specific materials under the exact irradiation conditions of interest, a wealth of information is available on irradiated stainless steel weldments in general, from which basic behavioral trends can be obtained. Some irradiation embrittlement apparently does occur in stainless steel weldments at the relatively low temperatures and fluences typical of light-water reactors. Tensile strength increases and ductility decreases. Low-cycle fatigue behavior is degraded somewhat, but high-cycle fatigue and fatigue crack growth seem largely unaffected. Effects of δ-ferrite on fracture resistance are small in both irradiated and unirradiated materials. Notch impact and fracture toughness are both reduced by irradiation, and a dependence of toughness on testing rate, not seen in wrought material, is indicated.

33181 **Radiation annealing mechanisms of low-alloy reactor pressure vessel steels dependent on irradiation temperature and neutron fluence.** Pachur, D. (Kernforschungsanlage Julich Postfach 1913, 5170 Julich). *Nuclear Technology;* **59**: No. 3, 463-475(Dec 1982).

Heat treatment after irradiation of reactor pressure vessel steels showed annealing of irradiation embrittlement. Depending on the irradiation temperature, the embrittlement started to anneal at about 220°C and was completely annealed at 500°C with 4 h of annealing time. The annealing behavior was normally measured in terms of the Vickers hardness increase produced by irradiation relative to the initial hardness as a function of the annealing temperature. Annealing results of other mechanical properties correspond to hardness results. During annealing, various recovery mechanisms occur in different temperature ranges. These are characterized by activation energies from 1.5 to 2.1 eV. The individual mechanisms were determined by the different time dependencies at various temperatures. The relative contributions of the mechanisms showed a neutron fluence dependence, with the lower activation energy mechanisms being predominant at low fluence and vice versa. In the temperature range where partial annealing of a mechanism took place during irradiation, an increase in activation energy was observed. Trend curves for the increase in transition temperature with irradiation, for the relative increase of Vickers hardness and yield strength, and for the relative decrease of Charpy-V upper shelf energy are interpreted by the behavior of different mechanisms.

33182 **Analytic predictions of the annealing response of A533-B reactor vessel steel welds.** Main, A.P.; Shriver, B.L. (University of Virginia Department of Nuclear Engineering and Engineering Physics Charlottesville, Virginia 22901). *Nuclear Technology;* **59**: No. 3, 456-462(Dec 1982).

A model for predicting the annealing response of A553-B weld materials has been developed. This model assumes that the irradiation-induced shifts in the nil ductility transition temperature (ΔNDTT) and Charpy upper shelf energy (ΔUSE) are a result of the introduction of three types of defects into the alloy. The recovery of ΔNDTT and ΔUSE depends on the concentration of each defect remaining after the annealing treatment. The three defect types, including their diffusion constants, are assumed to be the same for all A533-B welds. However, the contribution of each defect type to ΔNDTT and ΔUSE depends on the chemical composition of the material and possibly the neutron fluence. Copper, nickel, manganese, and chromium were found to correlate with ΔNDTT, while sulfur and phosphorus appeared to correlate with ΔUSE. Once the relative contribution of each defect type is known, the recovery of ΔNDTT and ΔUSE is predicted based on diffusion calculations. Both the annealing temperature and time are accounted for in the calculations. The final model was compared with experimental data on three materials tested by Westinghouse Electric Corporation and two materials tested by the Naval Research Laboratory. The model accurately predicted the recovery of ΔNDTT for all five materials annealed at 343°C (650°F) to 454°C (850°F) for 24 to 336 h. The predicted recovery of ΔUSE was not as accurate as that of ΔNDTT.

33183 **Significance of selected residual elements to the radiation sensitivity of A302-B steels.** Hawthorne, J.R. (Naval Research Laboratory Thermostructural Materials Branch, Material Science and Technology Division Washington, DC 20375). *Nuclear Technology;* **59**: No. 3, 440-455(Dec 1982).

The effects of three levels of copper content and phosphorus content and two levels of sulfur content on radiation sensitivity and postirradiation heat treatment response were explored for a reactor pressure vessel steel, Type A302-B. Test plates for the investigation were produced from 182-kg (400-lb) laboratory melts. The contributions of individual elements were assessed from Charpy-V (CV) notch ductility changes with 288°C (550°F) irradiation and with a 343°C (650°F), 168-h postirradiation heat treatment. Limited studies of properties recovery by postirradiation 399°C (750°F) heat treatment were also made. Radiation embrittlement sensitivity, as shown by CV transition temperature elevation and CV upper shelf reduction, generally increased with increased copper and phosphorus content and with decreased sulfur content. Certain ranges of phosphorus and copper content were found to be more critical than others. Response to 343°C (650°F) postirradiation heat treatment, as evidenced by transition temperature recovery in degrees Celsius, appeared to be independent of copper, phosphorus, and sulfur content for the ranges investigated. Response to heat treatment also appeared to be independent of the magnitude of the prior transition temperature elevation by irradiation. On the other hand, a dependence of percentage recovery on impurity element content was observed. A dependence of upper shelf recovery on copper content was also found. Six of the eight plate compositions exhibited full upper shelf recovery but only small transition temperature recovery after 343°C (650°F) heat treatment.

33184 **Investigation of cable deterioration inside reactor containment.** Clough, R.L.; Gillen, K.T. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Nuclear Technology;* **59**: No. 2, 344-354(Nov 1982).

The deterioration of polyethylene and polyvinyl chloride cable materials in the containment building of an operating nuclear reactor has been investigated. Since the maximum dose experienced by the cable materials was only 2.5 Mrad during about 12 yr of operating life, the extent of material degradation was surprising. Laboratory aging experiments on the two materials established that the cause of the material deterioration in the plant was radiation-induced oxidation. The degradation rate was correlated with local levels of radiation intensity. It was determined that strong synergisms of radiation and elevated temperature, and also dose-rate effects, lead to the surprisingly rapid degradation rates found with these materials. It is concluded that in the design of laboratory methods for aging and qualification testing of organic materials for use in a nuclear plant environment, the possible occurrence of dose-rate effects and synergisms needs to be taken into account.

33185 **Application of an ion exchange method for sensitivity improvement of an automated radionuclide analysis system.** Tokoi, H.; Fujii, M.; Ishizuka, A.; Kitaguchi, H.; Kudou, T.; Mizuno, K.; Ogushi, A. (Energy Research Laboratory, Hitachi, Ltd. 1168 Moriyama-cho, Hitachi, Ibaraki). *Nuclear Technology;* **57**: No. 2, 285-291(May 1982).

A high sensitivity radionuclide analysis system has been developed. An automated system employs an ion exchange method to concentrate target nuclides in reactor coolant water. The system consists of sample treatment equipment and an automatic sample changer in conjunction with a multichannel gamma-ray spectrum analyzer. The sample treatment equipment performs sampling, filtration, sample volume selection, and ion exchange. These four processes are fully automated. Performance tests show that the lowest analysis level is 10^{-6} μCi/ml of ^{131}I within 10% reproducibility. The processing time from sampling to ion exchange is within 10 min for samples <100 ml.

33186 **Bend testing for miniature disks.** Huang, F.H.; Hamilton, M.L.; Wire, G.L. (Hanford Engineering Development Laboratory, P.O. Box 1970, Richland, Washington 99352). *Nuclear Technology;* **57**: No. 2, 234-242(May 1982).

A bend test was developed to obtain ductility measurements on a large number of alloy variants being irradiated in the form of miniature disks. Experimental results were shown to be in agreement with a theoretical analysis of the bend configuration. Disk specimens fabricated from the unstrained grip ends of previously tested tensile specimens were used for calibration purposes; bend ductilities and tensile ductilities were in good agreement. The criterion for estimating ductility was judged acceptable for screening purposes.

33187 **Radiation-induced outgassing from sorption pump material.** Patel, V.N.; Anno, J.N. (University of Cincinnati Department of Chemical and Nuclear Engineering, Cincinnati, Ohio 45221). *Nuclear Technology;* **56**: No. 2, vp(Feb 1982).

The radiation-induced outgassing (RIO) was measured for a molecular sieve material used in sorption pumps (Linde Molecular Sieve Type 13X) exposed at 20°C to ^{60}Co gamma radiation at a dose rate of 9.0 X 10^4 rad/h. The measured outgassing rate was found to be (7.03 + or 2.21) X 10^{-10} Pa X l/(cm^3 X s) X Mrad^{-1} X h^{-1}, which is consistent with values determined previously for various metals. This RIO is equivalent to a thermal bakeout at only 30°C. It was concluded for this material that the RIO is not a viable alternative to thermal bakeouts.

33188 **Downflow post-critical heat flux heat transfer to low pressure water.** Robershotte, P.; Griffith, P. (Massachusetts Institute of Technology Department of Mechanical Engineering, 77 Mass Avenue Cambridge, Massachusetts 02139). *Nuclear Technology;* **56**: No. 1, 134-140(Jan 1982).

Post-critical heat flux heat transfer data for water in downflow have been obtained for the following conditions: mass velocity, 48.8 to 147 kg/sXm^2; wall temperature, 538 to 760°C; pressure, 1.3 to 2.6 bars; quality, 4.1 to +5.8%; tube diameter, 1.25 cm; and tube length, 66 cm. At low mass velocity, a frozen equilibrium model predicts the data well. At high mass velocity, droplet-vapor heat transfer is good enough so that a homogeneous equilibrium model predicts the data. Under no circumstances is droplet-wall heat transfer significant. When the vapor is in laminar flow, the heat transfer is particularly poor and the radiant heat transfer becomes a significant fraction of the total.

33189 **Weighing of heavy vessels using strain gauges.** Ruiter, J.R. (N.V. tot Keuring van Elektrotechnische Materialen Arnhem). *Nuclear Technology;* **55**: No. 3, 683-689(Dec 1981).

The effect of pressure and temperature fluctuations is greatly reduced by appropriate design and by prestressing of the lines in an apparatus for remote, continuous weighing of heavy pressurized vessels (60 bar) at high temperatures (250°C), even when these vessels are connected to other systems by means of metal lines. The weighing device is based on the application of strain gauges. The accuracy of measurement is within 0.5%. Weighing devices of this type can be applied, for example, in the process industry.

33190 **Thermal response of a flat plate of finite thickness immersed in a fluid with oscillating temperature.** Poindexter, A.M. (Westinghouse Electric Corporation Advanced Reactors Division, P.O. Box 158 Madison, Pennsylvania 15663). *Nuclear Technology;* **55**: No. 3, 656-661(Dec 1981).

Thermal response of flat plates immersed in a fluid with oscillating temperature is of current interest in the nuclear industry. A dimensionless solution characterizing the internal temperature response shape of the plate in terms of a single dimensionless parameter has been obtained. The solution is plotted in terms of dimensionless parameters. The maximum value of surface-to-average temperature difference in the plate and the elastic stress occurring during the sinusoidal temperature cycle can be determined using this solution without plotting and averaging temperature distributions for several different times during the cycle.

33191 **Initial-value methods for a simplified subchannel model of thermal-hydraulic behavior.** Nelson, P.; Neil, C.H. (Texas Tech University Institute for Numerical Transport Theory Department of Mathematics, Lubbock, Texas 79409). *Nuclear Science and Engineering;* **76**: No. 3, 366-370(Dec 1980).

It is shown that many of the numerical difficulties and phenomena encountered in subchannel analysis have counterparts within a simple two-subchannel model, which permits analytic study of these matters. Results are presented that suggest that the reported inability of initial-value techniques for subchannel models to cope with flow-blockage problems may be peculiar to the particular initial-value techniques frequently used.

33194 **Turbulent flow in rod bundles with geometrical disturbances.** Hejna, J.; Mantlik, F. (Nuclear Research Institute 250 68 Rez). *Nuclear Technology;* **59**: No. 3, 509-525(Dec 1982).

The results of measurements of shear stress distribution around wetted surfaces and velocity fields of turbulent flow in rod bundles with geometrical disturbances are presented. Experiments

were performed on an aerodynamic model composed of 19 rods in a hexagonal arrangement 6 m long with an outside diameter of 120 mm and a pitch-todiameter ratio of 1.17. The geometric disturbances were modeled by the displacement of the central rod from its regular position. An important influence of secondary flows on the velocity fields was revealed. From the experimental data, empirical formulas for shear stress distribution were derived.

33195 **Cesium release from coated fuel particles with failed coatings.** Amian, W.; Stover, D. (Kernforschungsanlage Julich GmbH, Institut fur Reaktorentwicklung Postfach 1913, 5170 Julich). *Nuclear Technology;* **57**: No. 2, 279-290(Nov 1982).

A laser boring technique has been used to simulate failed coatings of fuel particles. The cesium fractional release from irradiated failed particles is measured in time intervals during an annealing treatment at 1000 and 1200°C, respectively. In addition, the distribution of cesium along kernel and coating is measured by destructive gamma spectrometry. The fractional release versus time data are quantitatively recalculated by superposing diffusion from kernel and buffer layer using a two-zone assembly in spherical geometry. The derived kernel diffusion constants agree reasonably well with corresponding data from in-pile measurements.

33196 **An extension of the nodal Green's function method for reactor analysis.** Yu-Man, C.; Chambre, P.L.; Grossman, L.M.; Lew, B.S. (University of California, Department of Nuclear Engineering Berkeley, California 94720). *Nuclear Science and Engineering;* **81**: No. 2, 272-280(Jun 1982).

A method is presented for calculating the nodal flux distribution and the pin power distribution, as well as the effective multiplication, in a nuclear power reactor described by the one-dimensional, two-group diffusion equation. The method is based on the use of Green's functions in a nodal reactor description, and it extends the work of previous authors by including burnup-induced heterogeneities and by calculating local pin power distributions from spatial flux distributions within the node obtained by piecewise polynomial interpolation. An advantage of the method is that one obtains power and exposure distributions at fine mesh points, while retaining the economy characteristic of solutions of the neutron diffusion equation in the nodal framework. In numerical calculations carried out on model problems, good agreement is achieved between the results of the extended nodal Green's function method and those obtained using the CITATION finite difference code.

33197 **An equivalence relation for a doubly heterogeneous lattice.** Segev, M. (Ben-Gurion University of the Negev, Department of Nuclear Engineering, P.O. Box 653, Beer-Sheva 84 120). *Nuclear Science and Engineering;* **81**: No. 2, 151-160(Jun 1982).

This paper considers a lattice consisting of an infinite uniform distribution of clusters in an external moderator and a cluster consisting of a uniform distribution of absorber lumps in an internal moderator. The lattice is characterized by these parameters: cluster mean chord length; probability of neutrons leaving a cluster to collide in the external moderator prior to crossing a cluster; adjustable Bell factor for the clusters; lump mean chord length; probability of neutrons leaving a lump to collide in the internal moderator prior to crossing a lump; adjustable Bell factor for the lumps; internal moderator volume fraction in the cluster; internal moderator macroscopic cross section. The flux in (or resonance integral of) the absorber lump is equivalent to the flux in an infinite medium consisting of the lump material homogeneously mixed with a moderator of a calculated cross section which is dependent on a factor termed the "double heterogeneity" factor abbreviated "doublet". In the limit of an infinite single cluster, this factor approaches 1, yielding the correct single heterogeneity expression for the moderator cross section. This expression is quite general; the only restriction it places on the lattice structure is that a cluster contain many lumps.

33198 **A modified Wigner rational approximation for neutron collision escape probability from bare homogeneous reactor assemblies.** Kumar, A. (Bhabha Atomic Research Centre, Neutron Physics Division Trombay, Bombay 400 085). *Nuclear Science and Engineering;* **81**: No. 1, 66-74(May 1982).

The neutron collision escape probability from a medium depends on the shape of spatial distribution of the source. The case of a uniform or flat source distribution has been investigated extensively from time to time. In the present work, the case of bare homogeneous reactor assemblies having a centrally peaked neutron source distribution has been analyzed for predicting collision escape probability as a function of assembly size measured in terms of the optical mean chord length. An approximation, known as the modified Wigner rational approximation, is derived and given. Parameters have been determined for infinite slab, infinite cylinder, sphere, cube, and finite cylinders of height-to-diameter ratio varying from 0.1 to 20. It is shown that it is possible to predict the collision escape probability within approximately + or - 2% of the exact value for the optical mean chord length ranging from 0 to 20 mean-free-paths (mfp). Generally, for a given lΣ /SUB t/ , the collision escape probability value for the centrally peaked source is lower than that for the uniform source. But it is found that for very thin infinite slab assemblies of optical mean chord length $\leqq$ 1.5 mfp, the collision escape probability for centrally peaked source distribution is higher than that for uniform source distribution. The reason for this anomaly is discussed.

33199 **A model for gap conductance in nuclear fuel rods.** Loyalka, S.K. (University of Missouri-Columbia Nuclear Engineering Program, Columbia, Missouri 65211). *Nuclear Technology;* **57**: No. 2, 220-227(May 1982).

Computation of nuclear reactor fuel behavior under normal and off-normal conditions is influenced by gap conductance models. These models should provide accurate results for heat transfer for arbitrary gap widths and gas mixtures and should be based on considerations of the kinetic theory of gases. There has been considerable progress in the study of heat transfer in a simple gas for arbitrary Knudsen numbers (Kn = l/similar to d, where l is a mean-free-path and similar d is the gap width) in recent years. Using these recent results, a simple expression for heat transfer in a gas mixture (enclosed between parallel plates) for an arbitrary Knudsen number has been constructed, and a new model for gap conductance has been proposed. The latter reproduces the free molecular (small gap, Kn >> 1) and the jump limits (large gaps, Kn << 1) correctly, and it provides fairly accurate results for arbitrary gap widths. The new model is suitable for use in large fuel behavior computer programs.

33200 **Determination of thermal accommodation coefficients of helium, argon, and xenon on a surface of zircaloy-2 at about 25°C.** Thomas, L.B.; Loyalka, S.K. (University of Missouri-Columbia Department of Chemistry, Columbia, Missouri 65211). *Nuclear Technology;* **57**: No. 2, 213-219(May 1982).

Estimation of gap conductance in nuclear reactor fuel rods requires values for thermal accommodation coefficients of several gases on Zircaloy, uraniumdioxide, stainless steel, and other surfaces. These values for Zircaloy-2 have now been obtained by observing cooling rates of a Zircaloy sphere suspended in the several gases. These measurements are on so-called engineering surfaces, and no special attempt other than baking under high vacuum pumping was used to clean the surfaces. It is found, however, that if the recent kinetic theory results of Cercignani and Pagani on heat transfer from a sphere are used, then quite constant values for accommodation coefficients on a range of pressures are obtained.

33201 **The possible impact of fuel pellet cracking on inferred gap conductance and fuel stored energy.** Lanning, D.D. (Pacific Northwest Laboratory P.O. Box 999, Richland, Washington 99352). *Nuclear Technology;* **56**: No. 3, 565-574(Mar 1982).

Thermally induced cracking of the UO_2 fuel pellets undoubtedly results in some reduction of the effective fuel thermal conductivity, relative to that for solid UO_2 This effect may be approximated by appropriately chosen "crack factors" that reduce the solid-UO_2 thermal conductivity. The authors demonstrate that the assumption of reduced fuel conductivity always results in a reduction of the fuel stored energy that is inferred from fuel centerline temperature data. This reduction occurs whether the crack factors are introduced as simple constants or as functions of radial position

within the fuel pellet. If fuel performance computer codes remain "tuned" to the current body of centerline temperature data, those codes will predict lower fuel stored energy when fuel cracking is taken into account regardless of the modeling assumptions invoked. Accounting for fuel cracking should lead to a reduction in calculated peak cladding temperatures obtained in some loss-of-coolant accident simulations.

33202 **A model for the effective thermal and mechanical properties of cracked UO_2 pellets.** Williford, R.E.; Lanning, D.D.; Mohr, C.L. (Pacific Northwest Laboratory, Battelle Boulevard Richland, Washington 99352). *Nuclear Technology;* **56**: No. 2, 340-350(Feb 1982).

An alternate thermal-mechanical behavior model for cracked UO_2 pelletized fuel is presented. It is recognized that fuel cracking and relocation cause some of the initial pellet-cladding gap (the "free area") to be moved into the fuel in the form of cracks. The introduction of this free area into the fuel causes the fuel effective thermal conductivity and effective elastic moduli to be simultaneously reduced to values significantly less than laboratory data for solid pellets. Hooke's Law and a crack compliance model are used to deduce the effective fuel conductivity and moduli from simultaneous in-reactor measurements of rod power, fuel center temperature, and cladding elongation. The fuel-cladding "gap" is considered as another "crack," and is also described by the crack compliance model, which predicts that there is always some finite amount of fuelcladding contact. The primary thermal mechanical feedback mechanism is found to be due to crack closure effects on fuel effective thermal conductivity, rather than gap closure effects on gap conductance.

33203 **Irradiation performance of coated fuel particles with fission product retaining kernel additives.** Forthmann, R. (Kernforschungsanlage Julich GmbH Postfach 1913, 5170 Julich). *Nuclear Technology;* **56**: No. 1, 81-92(Jan 1982).

Four irradiation experiments for testing the efficiency of fission-product-retaining kernel additives in coated fuel particles are described. The evaluation of the obtained experimental data led to the following results: Alumina-silica kernel additives reduce the inpile release of ^{90}Sr and ^{140}Ba from BISO-coated particles at temperatures of about 1200°C by two orders of magnitude, and the cesium release from kernels by about one order of magnitude. Effective transport coefficient including all parameters that contribute to kernel release for $(Th,U)O_2$ mixed oxide kernels and low-enriched UO_2 kernels containing 5 wt% alumina-silica additives are given by the equations: log D /SUB k/ $/m^2.s^{-1} = -36028/T + 2.261$ (^{90}Sr) and log D /SUB k/ $/m^2.s^{-1} = -29646/T + 1.826$ (/SUP 134/ 137/ Cs). Alumina-silica kernel additives are ineffective for retaining /SUP 110m/ Ag in coated particles. However, an intact silicon carbide interlayer was also found to be ineffective at temperatures > 1200°C. The penetration of fission-product-containing eutectic additive melts into the buffer layer during irradiation can be avoided by using additives that consist of alumina and mullite without an excess of silica. Annealing of LASER-failed irradiated particles and results of the irradiation test FRJ2-P20 indicate that the efficiency of alumina-silica kernel additives is not altered if the coating becomes defective.

33204 **The effect of residual decontamination reagent on stress corrosion cracking of austenitic materials under high temperature water.** Yajima, M.; Sasaki, S.; Takashima, N.; Takimoto, S. (Toshiba Corporation Nuclear Energy Group, 13-12, Mita 3-chome, Minato-ku, Tokyo 108). *Nuclear Technology;* **56**: No. 1, 120-127(Jan 1982).

Stress corrosion cracking (SCC) of austenitic materials has been investigated under high temperature water into which a trace level of chemical reagent for reactor process decontamination was injected to simulate residual chemical reagent in normal reactor cooling water. Creviced bend beam and 4-in. pipe tests have been performed with two kinds of concentrated-type reagents and two kinds of dilute-type reagents. It was found that concentrated-type reagents, when injected into high temperature water by 1/1000 of a specified concentration, work as an oxygen scavenger and significantly inhibit intergranular stress corrosion cracking in both sensitized Type 304 stainless steel and Inconel alloys 600 and X-750. Dilute-type reagents did not reduce dissolved oxygen (DO) at all and one of the reagents tested accelerated SCC in Type 304 stainless steel when injected into high temperature water by 1/1000 of a specified concentration. Another dilute-type reagent partially suppressed cracking of Type 304 stainless steel at the same residual reagent concentration. It is suggested that residual level decontamination reagent will work in two ways, depending on residual concentration. When residual concentration is rather high, it will work as an oxygen scavenger and will not have detrimental effects in terms of SCC; when reagent concentration is very diluted, it will accelerate cracking in heavily sensitized Type 304 stainless steel, regardless of the type or kind of decontamination reagent. This effect will be reduced in actual operation since the DO level is about0.2 ppm maximum in the normal reactor water.

33205 **In-reactor measurement of cladding strain: fuel density and relocation effects.** Fehrenbach, P.J.; Morel, P.A.; Sage, R.D. (Atomic Energy of Canada Limited Research Company Chalk River Nuclear Laboratories, Fuel Materials Branch Chalk River, Ontario KOJ 1JO). *Nuclear Technology;* **56**: No. 1, 112-119(Jan 1982).

Measurement of fuel element diameters while the fuel is operating at power, in-reactor, has provided evidence of in-reactor fuel densification and relocation. The design and operation of the in-reactor diameter measuring rig used for these measurements are described. Diameter measurements were obtained from two fresh Zircaloy-clad UO_2 elements containing fuel of 10.64 and 10.82 Mg/m^3 density, respectively, at linear power outputs up to 61 kW/m. Similar measurements were also obtained from a 10.64 Mg/m^3 density element after low power irradiation at 26 kW/m to a burnup of 75 MW X h/kg uranium. Results indicate that higher starting fuel density and prior irradiation both reduce the amount and rate of in-reactor fuel densification observed. Diameter measurements following reactor shutdowns, particularly on the higher burnup element, also indicate that fuel relocation can overcome diameter decreases due to fuel densification and restore pellet-clad interaction.

33206 **Joining techniques for core flow test loop fuel rod simulators.** Moorhead, A.J.; McCulloch, R.W. (Oak Ridge National Laboratory Metals and Ceramics Division, Oak Ridge, Tennessee 37830). *Nuclear Technology;* **56**: No. 1, 7-22(Jan 1982).

Laser welding and furnace brazing techniques have been developed to join subassemblies for fuel rod simulators (FRSs) that have survived up to 1000-h steady-state operation at 700 to 1100°C cladding temperatures and over 5000 thermal transients, ranging from 10 to 50°C/s. A pulsed-laser welding procedure uses small diameter filler wire to join one end of a resistance heating element to a tubular conductor. The other end of the heating element is laser welded to an end plug, which in turn is welded to a central conductor. Before these welding operations, the intermediate material conductors (either tubular or rod) are vacuum brazed to matching copper leads. On room temperature tensile testing, 10 of 11 brazements between copper and nickel rods failed in the copper rather than the brazement. The thin walls and ductility of the copper and nickel tubular conductors caused joint machining and fitup problems. Accordingly, it has not been possible to consistently produce tensile test samples of brazed dissimilar metal tubular conductors that will fail outside the joint area. A unique tubular electrode carrier has also been developed for gas tungsten arc welding FRSs to the tubesheet of a test assembly. Two seven-rod mockups of the simulator-to-tubesheet joint area were welded and successfully cycled 500 times from 370°C (698°F) down to 100°C (212°F) with an internal pressure of 11.72 MPa (1700 psi). No leakage was detected by helium mass spectrometry, either before or after testing. Modified versions of the electrode carrier were developed for brazing electrical leads to the upper ends of the FRSs. Satisfactory brazes have been made on both single-rod mockups and arrays of simulators.

33207 **Influence of surface condition on crack initiation in iodine-induced stress corrosion cracking of zircaloys.** Cubicciotti, D.; Jones, R.L.; Syrett, B.C. (SRI International, Menlo Park, California 94025). *Nuclear Technology;* **55**: No. 3, 720-713(Dec 1981).

The effect of surface condition on the initiation of iodine-induced stress corrosion cracks in Zircaloy tubing was investigated. The internal surface of the Zircaloy tubing was given one of three surface treatments, namely etching, grit blasting, or shot blasting. Each of these treatments can readily be performed commercially on Zircaloy fuel cladding. Specimens of surface-treated tubing were locally stressed in an iodine environment at 590 K by indenting the outer surface of the tube wall with a small steel ball. The crack initiation pattern on the inner surface was examined in a scanning electron microscope. Crack initiation was found to be least developed for etched surfaces, was most developed for shot-blasted surfaces, and was developed to an intermediate degree for grit-blasted surfaces. Apparent anomalies between these crack initiation data and the time to failure data obtained previously in tube pressurization tests are rationalized on the basis of the cracking processes.

33208 **The effects of texture and surface condition on the iodine stress corrosion cracking susceptibility of unirradiated Zircaloy-2.** Syrett, B.C.; Cubicciotti, D.; Jones, R.L. (SRI International, Menlo Park, California 94025). *Nuclear Technology;* **55**: No. 3, 628-641(Dec 1981).

Four lots of stress-relieved Zircaloy-2 tubing were prepared from a single heat of the alloy. Tube reduction parameters were controlled so that each lot had a different crystallographic texture. The tubing with the most radial (least tangential) basal pole intensity was shown to have a Kearns texture number in the radial direction of 0.61, whereas the equivalent value for the tubing with the least radial texture was 0.48. Each lot of tubing was given one of three surface treatments: etched, etched and grit blasted, or lightly etched and shot blasted. The iodine stress corrosion cracking (SCC) susceptibility of the unirradiated tubing was determined by measuring the time to failure in a standard tube pressurization test at about 593 K in which 6 mg of iodine was present for each square centimetre of exposed Zircaloy surface. The results showed that texture has a large effect on SCC susceptibility and that surface condition has a significant but lesser effect. The SCC resistance was lowest in the material with the most tangential basal pole intensity and increased as the texture became more radial. The lightly etched and shot-blasted surface resulted in times to failure that were shorter than the times for the other two surface conditions. However, it seems likely that the influence of surface treatment is quite complex and that SCC susceptibility can change significantly with a seemingly minor change in the surface treatment technique. The effect of texture was interpreted in terms of its influence on strength, on deformation characteristics, and on orientation of SCC susceptible planes with respect to the dominant tensile (hoop) stress. The effect of surface condition was interpreted in terms of its influence on residual stresses, on local texture changes, on local stress concentration, and on chemical activity.

33209 **Design, production, and evaluation of a zircaloy-clad uranium target for an intense pulsed neutron source application.** Loomis, B.A.; Fogle, G.L.; Gerber, S.B.; Thresh, H.R. (Argonne National Laboratory Materials Science Division, 9700 S. Cass Avenue, Argonne, Illinois 60439). *Nuclear Technology;* **55**: No. 3, 617-627(Dec 1981).

The design of a Zircaloy-2-clad uranium alloy (450 ppm carbon, 250 ppm iron, 350 ppm silicon) target that can function as a pulsed spallation neutron source on interaction of a pulsed 500-MeV proton beam with the uranium nuclei is determined by consideration of irradiation damage, energy deposition, and thermal cycling effects in the target. The designed target is comprised of eight watercooled Zircaloy-2-clad uranium alloy disks, 10 cm in diameter and 2.7 cm thick operating at a maximum uranium alloy centerline temperature of 330°C. The production of the Zircaloy-2-clad uranium alloy disks involves remelting of the cast uranium alloy by the consumable electrode technique and bonding of the Zircaloy-2 to the uranium alloy by subjecting the composite to an isostatic-helium pressure at 840°C. The lifetime of the disks in the target before cracking of the Zircaloy-2 cladding owing to lowfrequency thermal cycling fatigue is estimated from stress calculations to be about 500 days. The results of thermal cycling tests on a disk tend to confirm the results of the stress calculations.

33210 **(BMI—1983-012) Comparative study of instrumentation and control engineering systems in nuclear power plants and in the Federal German railway system.** Frey, W.; Gueldner, W.; Gloe, K.H.; Marcus, G. (Bundesministerium des Innern, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Garching (Germany, F.R.)). Sep 1983. 84p. (In German). (GRS-A—840). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751499.

This report compares the control and instrumentation equipment of safety systems of the DB (German Railways) to those of nuclear power plants. Starting from the basic safety philosophies, the comparison covers system maintenance, the possibility of manual intervention, and also hardware safety measures for relay technology and for the use of computer systems. The comparative evaluation of common features and differences concerning both hardware and administrative measures tried to find out to what extent DB experience can be used for the special problems of nuclear power plants. An extensive documentation of DB control and instrumentation technology can be found in a supplement volume.

33211 **(INIS-BR—120, pp 32) Reactivity calculation in tests of control rod drop.** Nobrega, J. de A.W. da (Instituto de Engenharia Nuclear, Rio de Janeiro (Brazil)). 1983. (In Portuguese). NTIS (US Sales Only), PC A11/MF A01. Order Number TI84780396.

In Annual Progress Report of 1982.

33212 **(NUREG/CR—3606) Nuclear power plant control room crew task analysis database: SEEK system. Users manual.** Burgy, D.; Schroeder, L. (General Physics Corp., Columbia, MD (USA)). May 1984. 131p. (GP-R—212106). NTIS, PC A07/MF A01 - GPO* $5.50. Order Number DE84901384.

Portions are illegible in microfiche products.

The Crew Task Analysis SEEK Users Manual was prepared for the Office of Nuclear Regulatory Research of the US Nuclear Regulatory Commission. It is designed for use with the existing computerized Control Room Crew Task Analysis Database. The SEEK system consists of a PRIME computer with its associated peripherals and software augmented by General Physics Corporation SEEK database management software. The SEEK software programs provide the Crew Task Database user with rapid access to any number of records desired. The software uses English-like sentences to allow the user to construct logical sorts and outputs of the task data. Given the multiple-associative nature of the database, users can directly access the data at the plant, operating sequence, task or element level - or any combination of these levels. A complete description of the crew task data contained in the database is presented in NUREG/CR-3371, Task Analysis of Nuclear Power Plant Control Room Crews (Volumes 1 and 2).

33213 **Development of hafnium and comparison with other pressurized water reactor control rod materials.** Keller, H.W.; Hollein, D.A.; Hott, A.C.; Shallenberger, J.M. (Westinghouse Electric Corporation, Water Reactor Divisions P.O. Box 3912, Pittsburgh, Pennsylvania 15230). *Nuclear Technology;* **59**: No. 3, 476-482(Dec 1982).

Development of a special application of hafnium for pressurized water reactor control rods is discussed. A unique feature of the design is the sealing of the hafnium material inside protective stainless steel tubing, whereas in prior applications the hafnium material was exposed directly to the reactor primary coolant. A comparison is made of the new hafnium design with silver-indium-cadmium and B_4C hybrid control rod material design applications. The advantages and disadvantages of the alternative designs are summarized, including performance and fabrication considerations.

33214 **The development of the reactor management system.** Otsuka, T.; Kawamura, A.; Netsu, N.; Niki, K.; Sakamoto, Y.; Sekimizu, K.; Yanaoisawa, A. (Nippon Atomic Industry Group Company, Ltd., 4-1, Ukishima-cho Kawasaki-ku, Kawasaki-shi, Kanagawa-ken 210). *Nuclear Technology;* **59**: No. 2, 199-211(Nov 1982).

The Reactor Management System (RMS), an on-line system with a minicomputer, has been in operation at a boiling water reactor (BWR) nuclear power plant since 1977. The objectives of this system are to perform detailed monitoring and prediction of the core status and to make reactor operation more efficient, simpler, and easier. One of the features of the system is that the RMS utilizes process computer calculated data (such as power distribution and exposure distribution in the core) transferred through the data link, as well as the plant data (such as local power range monitor readings and control rod positions) transferred through the process input/output system. Based on operational experience at the BWR plant, calculation models have been improved to achieve higher accuracy, and new functions have been added to fulfill the operator's demands. The system has now become a useful tool for the operator. For instance, the power level prediction function has become essential for plant operation at the control rod pattern change.

33215 **Neutron diffusion in graphite poisoned with 1/v and non-1/v absorbers.** Malik, U.; Kothari, L.S.; Kumar, A. (University of Delhi, Department of Physics and Astrophysics Delhi-110007). *Nuclear Science and Engineering;* **81**: No. 1, 137-143(May 1982).

Neutron diffusion in graphite containing 1/v and non-1/v absorbers has been studied in the diffusion theory approximation using a multigroup (30-group) approach and the neutron scattering kernel proposed earlier by the authors. It is observed that, in this case as in the case of water investigated earlier, the behavior of neutrons in graphite poisoned with gadolinium is different from that in graphite poisoned with samarium or cadmium. To explain the reason for this difference, a hypothetical model for the energy variation of the absorption cross section has been constructed that closely resembles samarium in one limit and goes over to gadolinium in the other. The effect of varying the concentration of non-1/v absorbers on the flux of sub-Bragg and epicold neutrons has been studied for this model, and some interesting results are obtained.

33216 **Load follow simulation of three-dimensional boiling water reactor core by PACS-32 parallel microprocessor system.** Hoshino, T.; Shirakawa, T. (University of Tsukuba, Institute of Structural Engineering Sakura-mura, Niiharigun, Ibaraki-ken 305). *Nuclear Technology;* **56**: No. 3, 465-477(Mar 1982).

The three-dimensional boiling water reactor (BWR) core following the daily load was simulated by the use of the processor array for continuum simulation (PACS-32), a newly developed parallel microprocessor system. The PACS system consists of 32 processing units (PUs) (microprocessors) and has a multiinstruction, multidata type architecture, being optimum to the numerical simulation of the partial differential equations. The BWR core model includes the modified twogroup finite difference, coarse-mesh model for neutronics, steady-state model for thermohydraulics, criticality control by core coolant flow, and the time-dependent solution of iodine-xenon dynamics with constant flux level. The analysis of the parallel processing program revealed that the overhead is independent from the number of PUs and that the efficiency of PUs, i.e., the ratio of effective calculation over total, amounts to 75%, even up to 90% if it is limited to the core part. Simulation was made on the daily load follow for 144 h including the weekend, which took 1.3 central processing unit hours by the PACS system. The PACS system demonstrated a computation speed nearly one-tenth that of the large-scale high-speed general purpose computer, with a 25 times better cost performance ratio and showed that the system could be used as the pratical BWR core simulator with more complicated core models.

33217 **A generalized likelihood ratio approach to detecting and identifying failures in pressurizer instrumentation.** Tylee, J.L. (EG & G Idaho, Inc. P.O. Box 1625 Idaho Falls, Idaho 83415). *Nuclear Technology;* **56**: No. 3, 484-492(Mar 1982).

The generalized likelihood ratio (GLR) technique performs statistical tests on the innovations sequence of a Kalman filter state estimator. Using the results of these tests, failures in the sensors of a pressurized water reactor pressurizer are detected and identified. A third-order, linear model of the pressurizer dynamics, which is required by both the GLR and Kalman filter formulations, is developed from first principles. Using actual pressurizer data, the GLR method is employed to identify a bias in one of three level sensors.

33218 **Instrument fault detection in a pressurized water reactor pressurizer.** Clark, R.N.; Campbell, B. (University of Washington FT-10 Electrical Engineering Department, Seattle, Washington 98195). *Nuclear Technology;* **56**: No. 1, 23-32(Jan 1982).

A technique of functional redundancy (as opposed to hardware redundancy) for detecting incipient failures in process instruments is applied to a simulation of the loss-of-fluid test pressurizer. The failure detection scheme consists of a set of five Kalman filters and a logical means for combining estimated state variables with instrument signals to produce decision functions, which identify faults, as they occur, in each of five instruments. Test data from the simulated plant show that prompt detection of both bias faults and high noise faults is possible during small transient fluctuations in the pressurizer from its nominal operating state.

33219 **Radiation damage by high-energy neutrons.** Primak, W. (Argonne National Laboratory 9700 South Cass Avenue, Argonne, Illinois 60439). *Nuclear Science and Engineering;* **73**: No. 1, 29-34(Jan 1980).

Graphite rods and vitreous silica blocks were exposed to the neutrons generated in a spallation source having a large flux component in the 100-MeV region. The electrical conductivity of the former and the dilatation of the latter were measured. The ratio of the damage rate in silica to that in graphite exceeded that reported for fission neutrons, and this is attributed to the scattering cross sections of carbon falling more in the neutron highenergy region than do those of silicon and oxygen. Within the authors' knowledge of the fluxes and their spectra and the yield functions, no great enhancement of the damage rate is found as compared to that which would be calculated from simple isotropic scattering.

33220 **Markovian reliability analysis under uncertainty with an application on the shutdown system of the Clinch River Breeder Reactor.** Papazoglou, I.A.; Gyftopoulos, E.P. (Massachusetts Institute of Technology, Nuclear Engineering Department Cambridge, Massachusetts 02139). *Nuclear Science and Engineering;* **73**: No. 1, 1-18(Jan 1980).

A methodology for the assessment of uncertainties about reliability of nuclear reactor systems described by markov models is developed, and the uncertainties about the failure probability of the shutdown system of the Clinch River Breeder Reactor (CRBR) are assessed. Failure and repair rates and all other inputs of reliability analysis are taken as random variables with known probability distribution functions (pdf's). The pdf of reliability is calculated by both a Monte Carlo simulation and a Taylor series expansion approximation. Three techniques are developed to reduce the computational effort: ordering of system states, merging of Markov processes, and judicious choice of time steps. A Markov model has been used for reliability analysis under uncertainty of the shutdown system of the CRBR. It accounts for common-cause failures, interdependences between unavailability of the system and occurrence of transients, and inspection and maintenance procedures that depend on the state of the system and that include possibility of human errors. Under these conditions, the failure probability of the shutdown system differs significantly from that computed without common-cause failures, human errors, and input uncertainties.

2205 Environmental Aspects

33221 **(INIS-mf—8918) Act No. 8 of 10 January 1983 amending Act No. 393 of 2 August 1975 on requirements for the siting of nuclear electricity-generating plants.** (Italian Government, Rome). 14 Jan 1983. 2p. (In Italian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84780377.

This Act provides for the allocation of contributions to Communes and Regions where electricity-generating plants (with the exception of those fuelled by hydrocarbons) are located. The licensing procedure for siting of nuclear power plants under Act No. 393 of 2 August 1975 has now been amended. This new Act provides for intervention by the Interministerial Committee for Economic Planning (CIPE) in the determination of sites for nuclear power plants in Regions in cases where the latter have not determined a location within the time-limit prescribed by the 1975 Act. (NEA).

33222 **Environmental gamma-ray measurement methods for French nuclear installation impact studies.** Gauthier, D.; Bourdeau, F.; Caput, C. (Commissariat a l'Energie Atomique, DPr/SERE/CEN.FAR B.P. No. 6, 92260, Fontenay aux Roses). *Nuclear Technology;* **57**: No. 1, 50-57(Apr 1982).

Due to the development of the nuclear industry and current concern for the environment, studies need to be carried out on the impact of new nuclear power plants. One of the elements of this impact is external irradiation, which should be measured before installations are put into operation. Four measurement devices are compared: a scintillometer using a composite crystal, which takes into account the photon ionization power as a function of the energy (SCINTOMAT 6134 BEFIC); a tissue equivalent ionization chamber with magnesium fluoride polyethylene walls (CET 72 SAPHYMO-SRAT); a big ionization chamber filled with air at atmospheric pressure (CD 43 ALCATEL); and a pressurized gas ionization chamber made of a 25.4-cm-diam sphere containing argon at a 25-atm pressure STP (RSS 111 Reuter Stokes). For purposes of environmental measurements, the most important criteria of comparison are sensivity, relative fluctuation, and velocity of response, so that low dose rates can be measured when the device is set up in a truck moving at low speed for regional mapping. The comparison shows that the pressurized gas ionization chamber comes the closest to meeting the required conditions.

33223 **Monitoring krypton-85 during Three Mile Island Unit 2 purging.** Jester, W.A.; Baratta, A.J. (The Pennsylvania State University, University Park, Pennsylvania 16802). *Nuclear Technology;* **56**: No. 3, 478-483(Mar 1982).

The Penn State noble gas monitor played an important role in measuring environmental levels of ^{85}Kr during the purging of the Three Mile Island Unit 2 primary containment. It filled a gap in the U.S. Environmental Protection Agency monitoring program, which existed between their real time monitors and their cryogenic gas chromatographic separation technique. During the 15-day purging period, the system analyzed a total of 124 samples, of which 37 were quantified to contain ^{85}Kr in concentrations ranging from 3×10^4 to 1.5×10^6 pCi/m^3. The maximum whole body beta dose rate was found to be 0.28 mrem/h.

33224 **Photon point source buildup factors for air, water, and iron.** Chilton, H.B.; Eisenhauer, C.M.; Simmons, G.L. (University of Illinois at Urbana-Champaign Nuclear Engineering Program, Urbana, Illinois 61801). *Nuclear Science and Engineering;* **73**: No. 1, 97-107(Jan 1980).

Buildup factors for photons in infinite homogeneous samples of air, water, and iron have been calculated by a moments method code. The photons were assumed to be emitted from a point source. Comparisons of these results to values obtained earlier, both by experiment and by calculation, show reasonable agreement except in some instances of deep penetration. The parameters in the Berger empirical formula for buildup factors have been evaluated from the present work. The Berger formula is shown to fit the calculational results for nuclei of low atomic number at energies above 1 MeV and below 0.06 MeV. In mid-energy range, differences of as much as 40% are observed. The formula appears to provide excellent fit to the data for nuclei of medium atomic number.

33233 (INIS-mf—8976) **Annual report 1982.** (Stichting Energieonderzoek Centrum Nederland, The Hague). Jun 1983. 87p. (In Dutch). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84702049.

This annual report gives a survey of the activities of ECN at The Hague and Petten, Netherlands, in 1982. These activities are concerned with energy generation and development and with scientific and technical applications of thermal neutrons, which are available from the High Flux Reactor and the Low Flux Reactor at Petten. The Energy Study Centre (ESC), a special department of ECN, is engaged with social-economic studies on energy generation and utilization. ESC also investigates the consequences of energy scenarios. The Bureau Energy Research Projects (BEOP) coordinates and administers all national research projects, especially on flywheels, solar energy, wind power and coal combustion. After a survey of staffing and finances the report ends with a list of ECN publications.

33234 (ORNL—6058) **Preanalysis calculations of the US/UK joint experiment in the Dounreay prototype fast reactor.** Broadhead, B.L.; Gove, N.B.; Raman, S. (Oak Ridge National Lab., TN (USA)). May 1984. Contract AC05-84OR21400. 60p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013569.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The United States and the United Kingdom are engaged in a joint research program in which samples of the higher actinides are irradiated in the Dounreay Prototype Fast Reactor in Scotland. Purpose is to study the materials behavior of selected higher actinide fuels and to determine the integral cross sections of a wide variety of the higher actinide isotopes. Samples of the actinides are incorporated in fuel pins inserted in the core. For the fuel study, the actinides selected are ^{241}Am and ^{244}Cm in the form of Am_2O_3, Cm_2O_3, and $Am_6Cm(Re)_7O_{21}$, where (RE) represents a mixture of lanthanides. For the cross-section determinations, the samples are milligram quantities of actinide oxides of ^{248}Cm, ^{246}Cm, ^{244}Cm, ^{243}Am, ^{241}Am, ^{244}Pu, ^{242}Pu, ^{241}Pu, ^{240}Pu, ^{239}Pu, ^{238}Pu, ^{237}Np, ^{238}U, ^{236}U, ^{235}U, ^{234}U, ^{233}U, ^{232}Th, ^{230}Th, and ^{231}Pa encapsulated in vanadium. This report describes the calculational activities being performed in preparation for the post-irradiation analysis of the discharged samples. In particular, the calculational results presented are estimates of the irradiation products expected to be present in the first experimental pin discharged from the reactor.

33235 (ORNL/TM—9205) **Oak Ridge Research Reactor quarterly report, October, November, and December 1983.** Corbett, B.L.; Lance, E.D. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 33p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84012706.

The ORR operated at an average power level of 29.2 MW for 87.3% of the time during October, November, and December of 1983. The reactor was shut down on nine occasions, three of which were unscheduled. Reactor downtime needed for refueling and checks was normal. The reactor remained available for operation 91.4% of the time. Maintenance activities, both mechanical and instrument, were essentially routine in nature with the exception of two Reactor Instrumentation and Controls Design Change memorandums. In-service inspection completed during the quarter included the inspection of the ORR pool window.

33236 (ORNL/TM—9214) **Bulk Shielding Facility quarterly report, October, November, and December 1983.** Corbett, B.L.; Lance, E.D. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 22p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013480.

The BSR operated at an average power level of 443 kW for 0.09% of the time during October, November, and December 1983. Water-quality control in both the reactor primary and secondary cooling systems was satisfactory. The PCA was used in training programs and was operated on one occasion when the University of Kentucky students actively participated in training laboratories.

33237 **Developments in electrochemical oxygen meter probes for use in liquid sodium.** Barton, G.B.; Keough, R.F.; McCown, J.J.; Yount, J.A. (Hanford Engineering Development Laboratory P.O. Box 1970, Richland, Washington 99352). *Nuclear Technology;* **57**: No. 3, 315-319(Jun 1982).

A program was carried out to develop small less fragile ceramic electrodes for use in measuring oxygen in sodium. To use the electrodes as inserts in existing sampler hardware, composite metal-ceramic tubes were required. Four configurations of composite metal-ceramic probes employing yttria-doped thoria as the solid electrolyte were fabricated and tested. These incorporated both mechanical and brazed seals between the metal and ceramic. The most useful for fast flux test facility applications utilized a brazed seal between the ceramic and an alloy of matching coefficient of thermal expansion. A number of alternate reference systems were also investigated. Reference electrodes tested included Na-Na_2O, In-In_2O_3, Ni-NiO, and Ag-air.

33238 **Sensitivity and uncertainty analysis of the Coupled Fast Reactivity Measurements Facility central flux spectrum.** Ryskamp, J.M.; Andrel, R.A.; Broadhead, B.L.; Ford, W.E.; Lucius, J.L.; Marable, J.H.; Wagschal, J.J. (EG & G Idaho, Inc. P.O. Box 1625, Idaho Falls, Idaho 83415). *Nuclear Technology;* **57**: No. 1, 20-35(Apr 1982).

The Coupled Fast Reactivity Measurements Facility (CFRMF) is a zoned-core critical assembly with a fast neutron spectrum zone in the center of an enriched ^{235}U, water-moderated thermal driver. The central neutron field is a Cross-Section Evaluation Working Group benchmark for data testing of fission product, actinide, and dosimetry cross sections important to fast reactor technology. The AMPX and FORSS code systems were used to determine a covariance matrix for the CFRMF central neutron spectrum. The covariance matrix accounts for neutron cross section and fission spectrum uncertainties and correlations. Uncertainties in the ^{238}U inelasticscattering cross sections and in the ^{235}U fission spectrum were found to contribute most to the standard deviations in the central flux spectrum. The flux-spectrum covariance matrix contains strong correlations. This strongly motivates including the off-diagonal elements in data testing and cross section adjustment applications. The flux spectrum covariance matrix was applied in this work for integral data testing for dosimeter cross sections.

33239 **Development of high-uranium loaded U_3O_8-Al fuel plates.** Copeland, G.L.; Martin, M.M. (Oak Ridge National Laboratory, Metals and Ceramics Division, Oak Ridge, Tennessee 37830). *Nuclear Technology;* **56**: No. 3, 547-552(Mar 1982).

A common plate-type fuel for research and test reactors is U_3O_8 dispersed in aluminum and clad with an aluminum alloy. There is an impetus to reduce the ^{235}U enrichment from above 90% to below 20% for these fuels to lessen the risk of diversion of the uranium for nonpeaceful uses. Thus, the uranium content of the fuel plates has to be increased to maintain the performance of the reactors. Work at Oak Ridge National Laboratory has determined the maximal uranium loading for these fuels that can be fabricated with commercially proven materials and techniques and that can be expected to perform satisfactorily in service. Assuming satisfactory performance in irradiation tests to the required burnup, the author, anticipate being able to increase the uranium loading in U_3O_8-Al dispersions to the 3.1 Mg U/m^3 level (75 wt% U_3O_8). This loading level will allow many research reactors to be fueled by uranium of $<20\%$ enrichment.

33240 **Fast-neutron hodoscope at TREAT: methods for quantiative determination of fuel dispersal.** De Volpi, A.; Fink, C.L.; Marsh, G.E.; Rhodes, E.A.; Stanford, G.S. (Argonne National Laboratory Reactor Analysis and Safety Division, Argonne, Illinois 60439). *Nuclear Technology;* **56**: 141-188(Jan 1982).

For fuel-motion surveillance in Transient Reactor Test Facility experiments, the fast-neutron hodoscope has advanced beyond its initial ability to provide time, location, and velocity data: its quantitative mass results are now routinely used in liquidmetal fast breeder reactor accident projections. (Mass normalization is based on initial fuel inventory.) The material and radiation surroundings of the test section affect hodoscope detectors in intrinsic and instrumental ways that necessitate detailed corrections. Depending on the experiment, count rate compensation with as little as 5% total imprecision is usually desired for dead time, power-level changes, nonlinear response, efficiency, and background. In addition, systematic effects ranging up to 20% may occur, from such causes as self-shielding, self-multiplication, self-attenuation, and flux depression. For one- to seven-pin bundles, the hodoscope has achieved 1-ms time resolution, 0.25-mm lateral- and 5-mm axial-motion displacement detection, and 50mg single-pin, 350-mg seven-pin mass resolution-not all, however, simultaneously, since resolution and statistical precision are inversely related. The experimental and theoretical foundation for that performance is now well established.

33241 **Neutron and gamma-ray penetrations in thick iron.** Oka, Y.; An, S.; Kasai, S.; Koyama, K.; Miyasaka, S. (The University of Tokyo, Nuclear Engineering Research Laboratory The Faculty of Engineering, Tokai-mura, Ibaraki 319-11). *Nuclear Science and Engineering;* **73**: No. 3, 259-273(Mar 1980).

Measurements of neutron and gamma-ray penetrations in an iron shield were performed up to a 60-cm depth in a tightly coupled source shield configuration with the fast-neutron reactor YAYOI as a source. Rates of neutron reactions and gamma-ray dose rates in the iron shield were obtained using activation foils and thermoluminescent dosimeters. Analyses of the experiments were made by using the DOT-III code with coupled neutron and gamma-ray cross sections from ENDF/B-IV and POPOP4 libraries. To obtain the source condition for the iron shield analyses, the calculated spectrum was adjusted to the measured reaction rates at the reactor shield boundary. The calculated neutron and gamma-ray distributions in the iron shield show fairly good agreement with the experiments. The effect of difference in Bondarenko-type self-shielding factors on the analyses of the iron shield is also shown.

2207 Plutonium And Isotope Production Reactors

REFER ALSO TO CITATION(S) 32696, 33258, 33259, 33260

33242 **(DPST—72-428) Thermal discharges from the Savannah River Plant.** Brown, R.J.; Jacobsen, W.R.; Rabon, E.W.; Tilly, L.J. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Sep 1972. Contract AC09-76SR00001. 107p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013157.

Portions are illegible in microfiche products.

The nuclear production reactors at the AEC's Savannah River Plant, located by siting requirements, utilize on-site natural watercourses, swamps, and cooling water impoundments to dissipate heat in effluent cooling water. Stream-swamp cooling is the most efficient and economical cooling mechanism available to the two reactors presently using this method of heat dissipation. The effects on the Savannah River of high temperature water discharged from the reactors are thus minimized, and detrimental environmental consequences are confined to the plantsite. A large cooling water impoundment, which is currently being used to dissipate heat from one reactor, has furnished an extensive area for biological research into the effects on the aquatic community resulting from its varied thermal conditions.

33243 **(DPST—80-445-Del.Ver.) Neutron fluence in P,K reactor tank walls.** Gorrell, T.C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1 Oct 1980. Contract AC09-76SR00001. 15p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013176.

The neutron fluence (phi t) accumulated by the P,K reactor tank walls over 26 years of operation was calculated, for use in evaluating the possible deleterious effects of neutron irradiation. Fast neutrons can change the yield and ultimate strength, the hardness and the ductility of stainless steel. Thermal neutrons transmute atoms of one element of stainless steel (Cr, Mn, Fe, Ni) to another element, and thereby alter the metallurgical properties of the alloy. Previously, only gross estimates had been made of the tank wall fluence. Improved calculations described in this memorandum have yielded results suitable for use in planned metallurgical studies. Both the fast and the thermal fluences in the C reactor tank wall are less than in P or K.

33244 **(KURRI-TR—224) Flow test for the full scale core mock-up to the KUHFR, (2). Flow-induced vibrations of the core.** Mishima, Kaichiro; Araki, Yasusuke; Ishikawa, Yoshiaki. (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.). 6 May 1981. 64p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84702037.

The Research Reactor Institute, Kyoto University, has carried out a variety of research and development in support of the high flux reactor (KUHFR) project. As for the thermal-hydraulic design of the reactor core, the flow test with a full scale mock-up of the core was performed in order to verify the design calculation. This report shows the result of measurement of the vibration of the core vessel and core itself obtained during the flow test. The flow rate through the core mock-up reached up to 1920 m^3/h, which is approximately 1.3 times as much as the normal flow rate. Non-contact displacement sensors and piezoelectric accelerometers were used to measure the vibration of the core vessel, core components and outer fuel elements. The traces of the vibration were reproduced on charts to read the maximum amplitude. The data were analyzed to find the characteristics of the vibration. The observations of the corrosion and deformation of the components were made. The results obtained are as follows. The vibration of the core vessel was excited by coolant flow. The predominant frequency was about 7 Hz, which is nearly equal to that of the free vibration of the core vessel. The maximum displacement was 300 μm, and the maximum acceleration was 1.8 g.

33245 **(KURRI-TR—228) Report on material tests and mock-up tests for fabrication of the KUHFR reflector tank.** Yoshida, Hiroyuki; Araki, Yasusuke; Mitani, Shigefumi; Achiwa, Norio; Kawano, Shinji. (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.). 1982. 78p. (In Japanese). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84702038.

The Kyoto University high flux reactor (KUHFR) is designed to have a pair of cylindrical core vessels made of aluminum A 6061 and a spherical reflector tank made of stainless steel SUS 316 L containing the core vessels. The cooling and moderating light water flows downward. The reflector tank is filled with heavy water which is a good neutron moderator to offer a proper thermal neutron field for various irradiation and beam experiments. Many kinds of the test on SUS 316 L specimens treated under various conditions were carried out, such as metallographic microstructure observation, mechanical test and corrosion test. The results are summarized as follows. Most of the specimens showed good microstructure and excellent Huey corrosion resistance. The zone with reduced Cr at grain boundary was not observed in the specimens treated above 920 deg C. The specimens prepared after a commercial plate was treated according to the normal fabrication procedure showed good mechanical properties. A mock-up of actual size with typical nozzles was made of SUS 316 L plates and pipes. After the actual heat treatment, the change of the size and shape, residual stress, microstructure and corrosion resistance were examined to establish the fabrication procedure and heat treatment.

33246 **(ORNL/TM—9222) High Flux Isotope Reactor. Quarterly report, January-March 1984.** Dahl, T.L.; Farrar, M.B. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012667.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Routine reactor operation with three end-of-cycle shutdowns and four unscheduled shutdowns resulted in an on-stream time of 85.1% for the quarter. Three of the unscheduled shutdowns occurred during the first week of operation following the three-month major overhaul. The causes were (1) dropped rod, (2) primary

relief system leakage, (3) extension-tube piston drop, and (4) pressure balance system leaks. In addition, leaks were repaired on the Cell 110 heat exchanger tube and letdown line, and refurbishment of the secondary cooling pumps was continued. There were no radiological environmental or industrial-related incidents or injuries during the quarter.

33247 **(ANL/LWR/SAF—84-1) Hydrodynamic sweepout thresholds in BWR Mark III reactor cavity interactions.** Spencer, B.W.; Baronowsky, S.P.; Kilsdonk, D.J. (Argonne National Lab., IL (USA)). Apr 1984. Contract W-31-109-ENG-38. 42p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013937.

Portions are illegible in microfiche products.

Simulant-material experiments and related analysis are described which investigated hydrodynamics aspects of ex-vessel interactions following postulated core meltdown with subsequent meltthrough of the vessel lower head and ejection of molten corium from the vessel into the containment region beneath the vessel. Objectives were to examine the possible sweepout of water and corium from the cavity by the steam/H_2 flow. The dispersal pathways in this containment design include a single manway and four CRD penetrations in the cylindrical pedestal wall connecting to the drywell with a combined cross-sectional area of $\sim$ 10 m^2. These openings range from 3.4 to 6.3 m in elevation off the concrete floor of the cavity. The experiments were performed using a 1:34 scale mock-up of the RPV/pedestal region. The first tests were quasi-steady tests. Tests were also performed using molten Wood's metal (WM). Some tests were performed with water on the cavity floor, and one test was performed using steel shot. The test results indicated that threshold gas flowrates existed beyond which dispersal of water and/or corium from the cavity can be expected. The predominant dispersal flow regime observed in the experiments involved fluidization of the water or molten WM by the gas flowrate through the system and sweepout of the fluidized liquid droplets as the gas exited the cavity through the openings in the wall. The superficial gas velocity at the onset of water sweepout ranged from 0.87 to 1.04 m/s in the tests which agrees very closely to the calculated fluidization threshold of 0.96 m/s. Application of the fluidization model for prediction of sweepout for the full-size system suggests that sweepout of water and corium can occur if the breach size in the RPV lower head exceeds $\sim$ 10 and 17 cm dia, respectively, for steam blowdown at a vessel initial pressure of 1000 psi.

33248 **(BMI—1983-017) Reaction of the core melt with various rock types.** Hassmann, K. (Bundesministerium des Innern, Bonn (Germany, F.R.); Kraftwerk Union A.G., Erlangen (Germany, F.R.)). Nov 1983. 101p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84751478.

For evaluation of the long-term differences to be expected from the reaction of molten core material with various types of rocks, in connection with nuclear power plants built in rocky caverns, a determination was performed of the integral melt enthalpy, specific heat capacity, heat conductivity, density as well as the gases released up to the melting point of representative samples of new red sandstone, granite and slate. The integral melt enthalpies as well as the specific heat capacities show similar magnitudes each, while density and heat conductivity as well as gas release show wide differences.

33249 **(BMI—1983-018) Expansion of core melt within the concrete foundation - effects on the reactor building structure.** Hassmann, K.; Liphardt, W.; Bindseil, P. (Bundesministerium des Innern, Bonn (Germany, F.R.); Kraftwerk Union A.G., Erlangen (Germany, F.R.)). Nov 1983. 81p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751429.

The effects of core melt expanding in the concrete fundament of underground-situated nuclear power plants on the structure of the reactor building have been investigated. The radial reduction of the foundation plate is not to exceed 12 m, in case limited additional internal pressure loads of more than 6 bar are to be covered. Greater reductions will endanger the stability of the building. For the assumed load cases, no penetrating cracks will occur. During the subject test, the limiting walls of the building remained leakproof up to an internal pressure of 2.5 bar.

33250 **(BNL-NUREG—34545) Development of methods to predict both the dynamic and the pseudo-static response of secondary structures subjected to seismic excitations.** Subudhi, M.; Bezler, P. (Brookhaven National Lab., Upton, NY (USA)). 1984. Contract AC02-76CH00016. 5p. (CONF-840833—3). NTIS, PC A02/MF A01; 1 - GPO; GPO Dep. Order Number DE84010284.

From 5. American Society of Civil Engineers/Engineering Mechanics specialty conference; Laramie, WY, USA (1 Aug 1984).

Portions are illegible in microfiche products.

Multiple independent support excitation time history formulations have been used to investigate simplified methods to predict the inertial (or dynamic) component of response as well as the pseudo-static (or static) component of response of secondary structures subjected to seismic excitations. For the dynamic component the independent response spectrum method is used with current industry practice for the modal and direction of excitation combinations being adopted and various procedures for the group combination and sequence being investigated. SRSS combination between support groups is found to yield satisfactory results. For the static component, support grouping by elevation for preliminary design followed by support grouping by attachment point for final design assure overall safety in the design.

33251 **(CONF-780805—9) Fragmentation of UO_2 and UC drops entering a sodium pool.** Ganguli, A.; Bankoff, S.G. (Northwestern Univ., Evanston, IL (USA)). 1978. Contract AC02-76ET37210. 6p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013201.

From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).

Portions are illegible in microfiche products.

In this paper attention is focussed on whether coarse premixing of fuel and coolant is possible according to the jet penetration hypothesis, with applications to a hypothetical accident in a liquid metal cooled nuclear reactor. For UO_2 or UC fuel drops entering a sodium pool, the rapid bubble growth and collapse phenomenon, followed by crust breakup due to jet penetration, is analyzed as a function of the system pressure and coolant temperature. It appears that the UO_2-Na system fragments rapidly upon contact, for coolant temperatures above 300°C, while the corresponding temperature for the carbide fuel is around 600°C, at atmospheric pressures. For UO_2 but not for UC, there is a cut off pressure in the 0.1 to 3 MPa range, above which the crust does not break up for a particular coolant temperatures between 400 and 800°C. Higher sodium temperatures aid the breakup for both fuels. One concludes that coarse premixing for UO_2, but not necessarily for UC, is difficult to attain.

33252 **(CONF-790816—105) Fuel-coolant interaction in a shock tube with initially-established film boiling.** Sharon, A.; Bankoff, S.G. (Northwestern Univ., Evanston, IL (USA). Dept. of Chemical Engineering). 1979. Contract AC02-76ET37210. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013202.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Portions are illegible in microfiche products.

A new mode of thermal interaction has been employed, in which liquid metal is melted in a crucible within a shock tube; the coolant level is raised to overflow the crucible and establish subcooled film boiling with known bulk metal temperature; and a pressure shock is then initiated. With water and lead-tin alloy an initial splash of metal may be obtained after the vapor film has collapsed, due primarily to thermal interaction, followed by a successive cycle of bubble growth and collapse. To obtain large interactions, the interfacial contact temperature must exceed the spontaneous nucleation temperature of the coolant. Other cutoff behavior is observed with respect to the initial system pressure and temperatures and

with the shock pressure and rise time. Experiments with butanol and lead-tin alloy show only relatively mild interactions. Qualitative explanations are proposed for the different behaviors of the two liquids.

33253 **(CONF-840701—13) Mass spectrometric study of the release of volatile fission products from irradiated LWR fuel.** Johnson, I.; Steidl, D.V.; Johnson, C.E. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013424.

From Topical meeting on fission product behavior and source term research; Snowbird, UT, USA (15 Jul 1984).

Portions are illegible in microfiche products.

The objective of these studies is to experimentally determine the chemical form and the rate of release of volatile fission product species from defected irradiated LWR reactor fuel pins. After release from the defected fuel pin the gaseous species immediately enters the ionizer of a quadrupole mass spectrometer thus ensuring that their chemical form is not likely to be changed prior to identification and measurement. These studies differ from prior studies in that: (1) the chemical form of the volatile fission products will be determined; and (2) the detection and measurement method does not depend on the radioactivity of the fission product element. Information on the chemical form of the released fission product species will enable a more accurate description of their transport and reaction in the primary system. These studies are also expected to yield information on the reaction of fission products after release from the fuel oxide with the zircaloy cladding. The results of these studies are expected to increase the understanding of the first step in the release of fission products by irradiated fuel and therefore help in the accurate prediction of source terms.

33254 **(CONF-840816—6) Flashing and jet impinging condensation during a postulated sodium blowdown accident of an experiment loop in a test reactor cavity.** Wang, C.S.; Chuang, C.F. (Argonne National Lab., IL (USA)). Aug 1984. Contract W-31-109-ENG-38. 21p. NTIS, PC A; 3; GPO Dep. Order Number DE84006593.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

Paper copy only, copy does not permit microfiche production.

A study on flashing and jet impinging condensation has been made and applied to the analysis of reactor sodium blowdown accident. Results show that part of the liquid may flash into a vapor state at the exit of the breach during the accident. The existence of this vapor affects the sodium flow rate significantly. Results also show that the subsequent impingement of two-phase sodium onto the adjacent surfaces will increase the heat transfer to the wall. The vapor condensation can significantly reduce the amount of sodium vapor reaching the reactor cavity. The theoretical approach of the present study can also be used for other engineering applications.

33255 **(CONF-840816—7) Calculation of sample problems related to two-phase flow blowdown transients in pressure relief piping of a PWR pressurizer.** Shin, Y.W.; Wiedermann, A.H. (Argonne National Lab., IL (USA); ATResearch Associates, Glen Ellyn, IL (USA)). Feb 1984. Contract W-31-109-ENG-38. 23p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84006739.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

A method was published, based on the integral method of characteristics, by which the junction and boundary conditions needed in computation of a flow in a piping network can be accurately formulated. The method for the junction and boundary conditions formulation together with the two-step Lax-Wendroff scheme are used in a computer program; the program in turn, is used here in calculating sample problems related to the blowdown transient of a two-phase flow in the piping network downstream of a PWR pressurizer. Independent, nearly exact analytical solutions also are obtained for the sample problems. Comparison of the results obtained by the hybrid numerical technique with the analytical solutions showed generally good agreement. The good numerical accuracy shown by the results of our scheme suggest that the hybrid numerical technique is suitable for both benchmark and design calculations of PWR pressurizer blowdown transients.

33256 **(CONF-840833—4) Sloshing response of a reactor tank with internals.** Ma, D.C.; Gvildys, J.; Chang, Y.W. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84009629.

From 5. American Society of Civil Engineers/Engineering Mechanics specialty conference; Laramie, WY, USA (1 Aug 1984).

The sloshing response of a large reactor tank with in-tank components is presented. The study indicates that the presence of the internal components can significantly change the dynamic characteristics of the sloshing motion. The sloshing frequency of a tank with internals is considerably higher than that of a tank without internal. The higher sloshing frequency reduces the sloshing wave height on the free-surface but increases the dynamic pressure in the fluid.

33257 **(DOE/ET/37210—1) Mechanisms of vapor explosions. Final report, September 1, 1976-March 31, 1984.** Bankoff, S.G. (Northwestern Univ., Evanston, IL (USA)). May 1984. Contract AC02-76ET37210. 11p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013484.

Three areas which are relevant to the basic mechanisms of vapor explosions have been addressed, both experimentally and theortically: the destabilization of film boiling by a pressure shock wave; the basic fragmentation and mixing mechanisms once liquid-liquid contact has been achieved; the necessary conditions for a supercritical Board-Hall thermal detonation. It has been shown that shock waves of only a few bars overpressure can produce liquid-solid contacts for periods of a millisecond or more, with accompanying very high heat transfer rates, in a nickel-Freon system. The results are in agreement with a theoretical analysis demonstrating when contact is or is not established. Mixing time constants have been measured for tin-water interactions in a shock tube configuration. The predominant mode of interaction appears to be by multiple expansions and a contraction, which implies that in large scales the final contraction might give rise to a vigorous explosion. However this is not considered to be likely in the LMFBR because of the spontaneous nucleation requirement. Supercritical propagating plane detonations have been shown to be limited to a very narrow range of initial conditions, which would be very difficult to achieve in practice.

33258 **(DPST—78-545-Del.Ver.) GRASS calculation of a postulated Gang I withdrawal transient without shutdown.** Parks, P.B. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 19 Oct 1978. Contract AC09-76SR00001. 41p. NTIS, PC A03; 3; GPO Dep. Order Number DE84013172.

Paper copy only, copy does not permit microfiche production.

As part of the ongoing GRASS reactor safety verification program, a reactor transient was calculated for a Gang I rod withdrawal assuming the shutdown systems were inoperative. The analysis was made for the postulated accident in C reactor at the start of a Mark 16-31A charge. This document outlines the input data used in executing the calculation, describes the results, and discusses the known uncertainties in the GRASS models.

33259 **(DPST—79-486-Del.Ver.) Comparison of GRASS and AAMZON calculations.** Smith, J.A.; Parks, P.B. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 14 Sep 1979. Contract AC09-76SR00001. 65p. NTIS, PC A04; 3; GPO Dep. Order Number DE84013173.

Paper copy only, copy does not permit microfiche production.

A program is underway to compare results of reactor accidents analyzed by the sophisticated Generalized Reactor Analysis Subsystem (GRASS) with results derived from the simpler methods now used for routine analyses. The objectives of the program are to obtain the best possible descriptions of standard accidents, to demonstrate the conservatism of the simpler methods, and to derive bases for possible improvements in the simpler methods. The first result is to be accomplished (largely) by applying GRASS. (Extrapolation to alternative accident conditions probably will be done using the simpler methods.) The last two results are to be accom-

plished by conducting parallel analyses with both methods and explaining the differences. The study described in this report lays some of the groundwork for explaining differences, by comparing parallel calculations of a transient that is less complicated than most of the reactor accidents considered. It points out some of the basic differences that will be common to most of the reactor accident analyses.

33260 **(DPST—79-548) Confinement protection by automatic backup shutdown.** Smith, J.A. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 25 Mar 1980. Contract AC09-76SR00001. 48p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013166.

Technical Standards require maintaining the integrity of the airborne activity confinement system even if the safety rod scram system should fail during postulated rod-withdrawal and loss-of-target accidents. Arguments are presented here to show that engineered safety systems are capable of satisfying this requirement. The principal system applied is an automatic backup shutdown system utilizing the safety computers (ABS-S/C).

33261 **(EPRI-NP—3473) Pressurizer transient response: experimental data. Final Report.** Jordan, R.P. (Dartmouth Coll., Hanover, NH (USA). Thayer School of Engineering). May 1984. 187p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920375.

Pressurizer transient behavior is qualitatively examined through analysis of experimental data obtained from a scaled Freon-113 test facility. Descriptions of experimental results for tests based on the pressurizer boundary condition categories of heater input, relief flow, spray flow, surge inflow, and surge outflow are presented both as general category and individual test descriptions. Experimental data describing the scaled pressurizer response is included as the initiation of a pressurizer transient data base. Descriptions of the testing facility, data acquisition system, and instrumentation utilized are provided.

33262 **(EPRI-NP—3474) Multidimensional and two-phase flow effects in PWR core reflooding. Final report.** Ghiaasiaan, S.M.; Catton, I. (California Univ., Los Angeles (USA). Nuclear Energy Lab.). May 1984. 196p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920422.

Forced and gravity bottom reflooding experiments were carried out with a scaled 1692-rod slab core. The observations show that the overall quenching phenomena in both cases are one-dimensional and the basic thermal-hydraulic phenomena in both cases are similar. Based on experimental observations, semi-empirical and empirical methods are proposed for an approximate treatment of two-phase thermal-hydraulic and multi-dimensional effects in which flow field conservation equations are solved macroscopically. The proposed methods were incorporated in a computer code and were tested against a wide range of experimental data with favorable results.

33263 **(EPRI-NP—3493) Coupled-valve dynamic model for steam, two-phase, and subcooled discharge flow conditions. Final report.** Teske, M.E.; Bilanin, A.J.; Hecht, A.M. (Continuum Dynamics, Inc., Princeton, NJ (USA)). May 1984. 123p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920378.

Spring-loaded, self-actuating safety valves are employed as part of the overpressure protection systems in PWR nuclear power plants. In order to design and predict their performance, valve dynamic behavior must be studied over a range of fluid and system conditions. The EPRI/PWR Safety and Relief Valve Test Program collected a significant amount of experimental data on valve behavior under stable and unstable protypical dynamic conditions involving high quality steam and subcooled liquid. This report discusses a one-dimensional theoretical model developed to study the effects of different valve and system parameters influencing valve dynamic behavior benchmarked against the test program data base. The model is capable of predicting the effects of valve geometric and dynamic characteristics and upstream pipe length and diameter on performance under steam and subcooled liquid discharge conditions. Valve geometric parameters include the valve dimensions which control flow areas and disc and seat forces. The back pressure area and magnitude effects are included, as well as the set pressure and ring position effects. The analytical and empirical foundations of the valve model are documented here and comparisons are made between model simulations and the full scale test results. The theory and computer code described in the present report include the flow of high quality steam, using the isentropic ideal gas approximation, and subcooled liquid, two-phase and superheated steam using steam tables parameterized over the pressure range of interest.

33264 **(EPRI-NP—3513) Postaccident liquid sampling systems. Final report.** Davidson, G.R.; Lahti, G.P. (Sargent and Lundy, Chicago, IL (USA)). May 1984. 229p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920385.

The postaccident and routine analysis of reactor coolant water for gamma fission product activity, boron concentration, pH, and chloride ion concentration was studied. Objectives were (1) to evaluate NRC postaccident monitoring guidelines, (2) to characterize postaccident conditions, (3) to evaluate post-accident monitoring methods and equipment, and (4) to investigate improvements. These issues were explored by (1) comparing postaccident information needs in comparison with regulatory requirements, (2) calculating postaccident radioactivity concentrations, (3) assembling data on commercial postaccident monitoring systems, and (4) performing laboratory tests. Postaccident gamma spectrometry was investigated. Effects of ambient airborne radioactivity, high count rates, and count rate reduction techniques were studied. A prototype automated on-line analysis system incorporating chemical separation and sample holdup for decay was developed. Performance specifications and techniques of commercial on-line systems are assessed, and relative merits of on-line and grab sample systems are discussed. Several methods of chemical analysis were evaluated. For boron, these were titration of the mannitol-borate complex, potentiometry with Na^+ and H^+ ion-selective electrodes, and a method not yet commercially used for reactor coolant, spectrophotometry with the reagent azomethine; for pH, potentiometry with the glass electrode; and for chloride ion, ion chromatography and potentiometry with the chloride ion-selective electrode. While most of the methods satisfied NRC guidelines, the performance of some was marginal.

33265 **(EPRI-NP—3519) Development of an analytic model to determine pump performance under two-phase flow conditions. Final report.** Furuya, O. (Tetra Tech, Inc., Pasadena, CA (USA)). May 1984. 67p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920381.

During a hypothetical LOCA (loss of coolant accident), the recirculating coolant of PWR (pressurized water reactor) may flash into steam due to a loss of line pressure. Under such two-phase flow conditions, it is well known that the recirculation pump becomes unable to generate the same head as that of the single-phase flow case. Based on the one dimensional control volume method, an analytical method has been developed to determine the performance of pumps operating under two-phase flow conditions. The analytical method has incorporated pump geometry, void fraction, flow slippage and flow regime into the basic formula, but neglected the compressibility and condensation effects. During the course of model development, it has been found that the head degradation is mainly caused by higher acceleration on liquid phase and deceleration on gas phase than in the case of single-phase flows. The numerical results for head and torque degradations were obtained with the model and favorably compared with the test data of air/water two-phase flow pumps of Babcock and Wilcox (1/3 scale) and Creare (1/20 scale).

33266 **(GEND—035) Submerged demineralizer system vessel shipment report.** Quinn, G.J.; Henrie, J.O.; Greenborg, J. (EG and G Idaho, Inc., Idaho Falls (USA)). Jun 1984. Contract AC07-76ID01570. 81p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013866.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Vessels containing zeolites and absorbed fission products from processing accident-generated water at Three Mile Island

through the Submerged Demineralizer System were found to generate radiolytic hydrogen and oxygen gases. In some vessels with high curie contents, gas generation during shipment could have resulted in flammable gas concentrations exceeding federal limits for radioactive material shipments. Tests of a catalyst bed in the vessel demonstrated that recombination of the gases back into water would permit safe shipment of the sealed vessels. Catalyst was loaded into an available screen assembly in each vessel. Vessel pressure monitoring ensured that net gas generation had stopped and that hydrogen and oxygen concentrations were kept below flammable limits. All shipments complied with federal regulations.

33267 **(GEND—040) Final report on the in situ testing of electrical components and devices at TMI-2.** Soberano, F.T. (United Engineers and Constructors, Inc., Philadelphia, PA (USA)). Jun 1984. Contract AC07-76ID01570. 108p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84014163.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A total of 88 electrical components and devices were in situ tested. Of these, 11 totally failed and 21 suffered degradation that varied from mild to severe. The equipment that failed or incurred severe degradation was located in areas of known environmental extremes. Several motor operated valves in the Reactor Building basement failed because of submersion in water. Others severely degraded from contamination tracking, resulting in the alteration of their circuit electrical characteristics - a circumstance that could compromise their designed function. One backup oil lift pump motor for a reactor coolant pump motor, although located well above the Reactor Building basement high water mark, failed because of a break in its armature and field circuits; this failure was surmised to be a result of corrosion. The limit switch of a Class 1E solenoid valve likewise failed due to moisture intrusion. Components that noticeably degraded exhibited anomalies, likely due to the incursion of moisture, that varied from high capacitance to increased circuit resistance. The effect of the other degenerating conditions that existed during the accident, such as high temperature, high radiation levels, and the hydrogen burn, could not be evaluated individually or synergistically.

33268 **(GKSS—83/E/58) Installation of an infrared measuring device in pressure release phenomena.** Sakkal, F. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1983. 62p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751492.

To analyze the saturated steam density and infrared measuring device was installed in a large scaled test facility. The possibility of accurate measuring of the density of two phase-two component flow and the ability to a rapid reaction on density oscillation are emphasized. In addition, the device allows an exact analysis of the density in two phase-two component flow with detailed information about the nature of condensation phenomena.

33269 **(GKSS—83/E/59) Investigation of sodium concrete interaction and the effect of different by-products.** Schultheiss, G.F.; Fritzke, H.W. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1983. 14p. (CONF-8307118—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751493.

From 1. international conference on the use of fly ash, silica, fume and other mineral by-products in concrete; Montebello, Canada (31 Jul 1983).

For heat transfer at temperatures of more than 770 K sodium or sodium-potassium alloy is used in fast breeder reactors or solar power plants. In case of leakage of hot liquid metal concrete is loaded thermally and chemically. The interaction of sodium with several concretes of different composition has been investigated experimentally and theoretically. Especially the quartz content of concrete has a significant influence on reaction behavior. Quartz-containing concrete specimens were severely damaged at temperatures of more than 600°C. Computer code modelling shows good agreement with experiments.

33270 (IAEA-SMR—68/2, pp 527-562) **TMI-2 and reactor safety.** Kato, W.Y. (Department of Nuclear Energy, Brookhaven National Lab., Upton, NY (USA)). Jun 1982. NTIS (US Sales Only), PC A25/MF A01. Order Number TI84780440.

Paper copy only, copy does not permit microfiche production2 refs.

In Operational physics of power reactors. Proceedings of the course on operational physics of power reactors including start up, testing and fuel management held at Trieste, 3-28 March 1980 during the winter college on nuclear physics and reactors jointly organized by the IAEA and the ICTP and held at the ICTP, Trieste, 22 January - 28 March 1980.

The accident on March 28, 1979 at the Three Mile Island Unit 2 (TMI-2) nuclear power station located near Harrisburg, Pennsylvania has had a major impact upon the design, construction, operation, regulation and safety research of nuclear power plants. It also has had an impact on utility and regulatory organizations. This paper presents a review of the TMI-2 accident scenario, its consequences and the conclusions of various investigating groups. An overview of the nuclear licensing process, computer codes used in safety analysis, safety research, and current issues is provided, using as a basis the TMI-2 accident. Some of the current safety issues which are included in the proposed NRC rulemaking hearings on such subjects as safety goals, siting criteria, emergency plans, and degraded or damaged core analysis are discussed.

33271 (INIS-BR—120, pp 206-207) **Determination of CTS-1 parameters in emergency cases.** Araujo, F.G.B. de; Cesar, S.B.G. (Instituto de Engenharia Nuclear, Rio de Janeiro (Brazil)). 1983. (In Portuguese). NTIS (US Sales Only), PC A11/MF A01. Order Number TI84780396.

In Annual Progress Report of 1982.

33282 (INIS-mf—8345) **GRS annual report 1982.** (Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Garching (Germany, F.R.)). 1982. 79p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84780326.

The report contains, among other things, the "Risk-Orientated Analysis for the SNR-300". Moreover, current work in the fields of projects, data processing, procedures (simulation, PKL experiment E 1), and systems (ergonomics) are described. The field of dynamics and radiation protection dealt with the aspects of disturbances and activity releases in heavy accidents of the SNR-300. In the field of operation recurrent tests in npps and studies in plant safety were made. The programme "Research on the Safety of LWR" was technically supervised together with the project. (DG).

33283 (INIS-mf—8747) **Evaluation and mitigation of accidental releases of radioactivity. Identification of uncertainties. Proceedings.** Bruessermann, K. (ed.). (Gesellschaft fuer Umweltueberwachung m.b.H., Aldenhoven (Germany, F.R.)). Dec 1982. 74p. (CONF-8104232—). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84780346.

From Workshop on evaluation and mitigation of accidental releases of radioactivity; Bad Muenstereifel, F.R. Germany (5 Apr 1981).

One result of the workshop was, that even in the case of severe accident sequences in modern nuclear power plants (other facilities were not discussed), there will be enough time to take active measures in order to lower the emissions and to diminish the consequences inside and outside of the plant. On the whole, new evidence from Harrisburg show that previously estimated accidental emissions, especially of radiologically relevant nuclides, have been rather conservative and that much lower emissions are possible, if the above measures are considered. Under accident conditions, models to predict radiation exposure must be applied under the event of a short-term release. (orig./DG).

33284 (INIS-mf—8930, pp 91-103) **Simulation of dynamics of pressurized water reactor power plant.** Mueller, V.; Sedlacek, J.; Zatloukal, J. (Skoda, Plzen (Czechoslovakia)). 1981. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780245. (CONF-8112102—Vol.3).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

The mathematical and physical model is described used for the analysis of failures of pressurized water reactor units as is computer program SIMOD-1S. The computed variants are based on the nominal output level of power plant operation. The following failures are considered: a failure of the turbogenerator with simultaneous failure of the automatic control for opening the by-pass stations of steam to condenser, the simultaneous failure of the turbogenerator and a varying number of main circulating pumps, variants with deviations from the reference output of the turbogenerators, variants with change in reactivity. (H.S.).

33285 (INIS-mf—8930, pp 118-129) **LOCA analyses.** Brezina, V.; Sekyra, M. (Energoprojekt, Prague (Czechoslovakia)). 1981. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780245. (CONF-8112102—Vol.3).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

The problem is discussed of the investigation of loss-of-coolant accidents of the primary circuit of a nuclear power plant. Currently the EGP uses a derivative of the RELAP-3 program known as RELAP-EGP, and program RELAP MK4 which is the British version of RELAP 4, somewhere between MOD005 and MOD006, is being tested and put into operation. A brief description is presented of a physical model of the primary circuit and mathematical solutions are indicated. For demonstrating the course of the computations the time courses are analyzed of the throughflow between the reactor core and the upper mixing chamber of the reactor and between the outlet from the reactor and the point of connection of the pressurizer to the hot branch of the primary circuit. Also discussed is the influence of the composition of the model circuit on the results and possible errors. (B.S.).

33286 (INIS-mf—8930, pp 161-165) **Program TRANS for calculation of transients in light water reactor fuel assembly.** Juzova, Z. 1981. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780245. (CONF-8112102—Vol.3).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

The TRANS program is designed for solving transient processes which may occur in the fuel assembly of a light water reactor owing to disturbances in reactivity, output, pressure, input temperature or flow rate, pressure losses, etc. The program considers concentrated coolant parameters over the fuel assembly cross section and describes the one-dimensional coolant flow along a rod bundle. Also solved is the problem area of the thermodynamic imbalance between the water and steam phases, heat transfer from fuel to coolant and heat conduction in fuel. The program also solves the problem of safety in case of departure nucleate boiling. The problems related to changes in reactivity are solved using the point model of neutron kinetics. (J.B.).

33287 (INIS-mf—8930, pp 104-117) **Calculation of transients in WWER power plant.** Macek, J.; Kyncl, M. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). 1981. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780245. (CONF-8112102—Vol.3).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

A mathematical model is described for the computation of transient processes in a nuclear power plant as is the DYNAMIKA computer program. The program is used for computing two accident variants: rupture of the main steam collector and a failure of the main circulating pump. (H.S.).

33288 **(IS-M—475) Reliability of steel containments with internal pressure.** Greimann, L.; Fanous, F. (Ames Lab., IA (USA)). Jan 1984. Contract W-7405-ENG-82. 4p. (CONF-840160—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84014128.

From EM/GT/ST specialty conference; Berkeley, CA, USA (1 Jan 1984).

Containment structures for nuclear power plants have long been designed for static internal pressure. However, since the Three Mile Island accident there has been heightened interest in the behavior of containments under conditions beyond design, particularly the actual, in-place resistance of containments to static internal pressure. Probabilistic methods are being applied to both the loading and resistance quantities so public risk can be accurately assessed. In this paper, a reliability assessment of a steel containment under uniform internal pressure will be summarized.

33289 **(IS-M—486) Uncertainties associated with containment analysis.** Greimann, L.; Fanous, F. (Ames Lab., IA (USA)). 1984. Contract W-7405-ENG-82. 18p. (CONF-840647—19). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013730.

From ASME pressure vessel and piping conference; San Antonio, TX, USA (17 Jun 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The containment structure is designed to prevent leakage for a variety of environment and accident loading conditions. However, loadings more severe than the design loading can be postulated, such as an increasing pressure. Approaches to predicting the containment resistance to an internal pressure are summarized. Uncertainties associated with these approaches are also discussed. Containment failure criteria are not well established. However, most investigators agree that the containment has failed when leakage occurs, since it can no longer perform its intended service. Several criteria have been employed to express containment failure: the formation of a limit mechanism, strain or deformation limits and buckling. For concrete containments, additional criteria such as radial shear stresses, liner plate strain and reinforcement steel strain are often used as an indication of failure. Almost all containment analyses, to date, have been based upon an axisymmetric structural model of the containment shell. For this model, many nonsymmetric features must be neglected or accounted for in an approximate way. The degree of sophistication of the analyses techniques range from hand calculations to finite element methods. Another source of uncertainty in the prediction of containment strength is the material model. Uncertainties often exist in the data. The analytical description of reinforced concrete is one of the larger uncertainties in the analysis of concrete vessels. Aspects of the steel/concrete interface, i.e., bond, anchorage, are difficult to describe analytically. The cracking, bar yielding and aggregate interlocking problem remain yet unsolved. Soil and pressure modeling are another source of uncertainty.

33290 **(IS-M—489) Probabilistic seismic resistance of a Mark III steel containment.** Fanous, F.; Greimann, L. (Ames Lab., IA (USA)). 1984. Contract W-7405-ENG-82. 17p. (CONF-840647—21). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013727.

From ASME pressure vessel and piping conference; San Antonio, TX, USA (17 Jun 1984).

Concern for the safety of nuclear power plants has motivated efforts to determine the statistical characteristics of the seismic resistance of steel containments. This paper represents a portion of a project whose objective is to assess the uncertainty of containment strength subjected to earthquakes (and other types of loading). The seismic response is predicted by a random vibration technique outlined in a paper previously published by the authors and calibrated to a design response spectrum. BOSOR4 is first used to predict linear vibration modes. Modal analysis methods are utilized, with the random vibration technique, to obtain a statistical description of the random process stress resultants for a unit g peak ground acceleration. Peak stress resultants are described by Extreme Value I. The mean peak values are input into BOSOR5 and the peak g-level is increased until failure (strain ductility of two) is reached. An approximate product failure function is obtained by perturbing the other random variables, namely, geometric imperfections, damping, and yield strength. The Advanced First Order Second Moment technique is then used to construct the cumulative distribution of the containment seismic resistance as a function of peak ground acceleration. The resulting distribution is given for a typical Mark III steel containment. Fragility curves for the containment at 95% and 5% certainty are also given.

33291 (IWGFR—43, pp 35-42) **Italian position paper on the safety analysis of liquid metal fast breeder reactors as related to sodium fires. The PEC reactor.** Gerosa, A. (Safety and Health Protection Directorate, ENEA, Rome (Italy)). Jan 1983. NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780439. (CONF-820590—Summ.).

From International working group on fast reactors specialists' meeting on sodium fires, design and testing; Richland, WA, USA (24 May 1982).

To obtain a deep understanding of physical phenomena and engineering problems connected with sodium fires, and to optimize the utilization of human and financial resources available, CNEN (now ENEA) has decided to join the French Commissariat a l'Energie Atomique (CEA) in the realization of a Franco-Italian experimental programme on sodium fires, named ESMERALDA. As for design preventions for PEC reactor (a fast flux, liquid metal cooled, fuel element testing reactor) fundamental choices were made taking into account all available knowledge, but with particular reference to the results of CEA's previous experiments on sodium fires. More detailed design analysis will be possible in the future, based on experimental results coming from the ESMERALDA programme.

33292 (IWGFR—43, pp 49-62) **Liquid metal fires. A review of work status in the United Kingdom.** Newman, R.N. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.); Vaughan, G.J. (National Nuclear Corp. Ltd., Risley (UK)); Hargreaves, K. (UKAEA, Risley). Jan 1983. NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780439. (CONF-820590—Summ.).

From International working group on fast reactors specialists' meeting on sodium fires, design and testing; Richland, WA, USA (24 May 1982).

These studies comprise investigations of the combustion mechanisms of sodium in both liquid and vapour states, and of the reactions of sodium with structural materials at high temperature. Extensive studies are also under way on the chemical and physical nature and on the behaviour of airborne reaction products released from fires. Data from these studies are used as an input to codes developed to model conditions resulting from sodium fires and thus to provide a basis for the design of containment structures and air clean-up equipment requirements. A knowledge of liquid metal combustion mechanisms is also a necessary adjunct to the development of fire prevention and fire-fighting systems. In the UK fire studies are conducted by CEGB (Berkeley Laboratories), NNC and the UKAEA, and this paper reviews the status of work carried out.

33293 (IWGFR—43, pp 63-70) **United States position paper on sodium fires, design and testing.** Hilliard, R.K. (Hanford Engineering Development Lab., Richland, WA (USA)); Johnson, R.P. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group); Powers, D.A. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1983. NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780439. (CONF-820590—Summ.).

From International working group on fast reactors specialists' meeting on sodium fires, design and testing; Richland, WA, USA (24 May 1982).

The first Specialists' Meeting on sodium fire technology sponsored by the International Working Group on Fast Reactors (IWGFR) was held in Richland, Washington in 1972. The group concluded that the state-of-technology at that time was inadequate to support the growing LMFBR industry. During the second IWGFR Specialists' Meeting on sodium fires, held in Cadarache, France in 1978, a large quantity of technical information was exchanged and areas were identified where additional work was needed. Advances in several important areas of sodium fire technology have been made in the United States since that time, including improved computer codes, design of a sodium fire protection

system for the CRBRP, measurement of water release from heated concrete, and testing and modeling of the sodium-concrete reaction. Research in the U.S. related to sodium fire technology is performed chiefly at the Energy Systems Group of Rockwell International (including Atomics International), the Hanford Engineering Development Laboratory, and the Sandia National Laboratories. The work at the first two laboratories is sponsored by the U.S. Department of Energy, while that at the latter is sponsored by the U.S. Nuclear Regulatory Commission. Various aspects of sodium fire related work is also performed at several other laboratories. The current status of sodium fire technology in the U.S. is summarized in this report.

33294 **(KFK—3560) Direct measurement of aerosol shape factors.** Zeller, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Lab. fuer Aerosolphysik und Filtertechnik I; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Dec 1983. 73p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751451.

The dynamic shape factor whereas the coagulation shape factor is an average over the total examined size range. The experiments have shown that the results of experiments with a certain aerosol system cannot be transferred to other aerosol systems without further consideration. The outer shape of particles of a certain size depends on the specific properties of the material as well as on the experimental conditions during the aerosol generation. For both aerosol systems examined the mean dynamic shape factor, averaged over the total examined size range, agrees roughly with the coagulation shape factor. (Description of aerosol centrifuge and of differential mobility analyzer).

33295 **(LA-UR—83-3658) TRAC-PF1 analysis of loss-of-fluid test L6-7/L9-2.** Meier, J.K. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 16p. (CONF-840813—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84004415.

From Design, construction and operation of nuclear power plants conference; Portland, OR, USA (5 Aug 1984).

Portions are illegible in microfiche products.

The Los Alamos National Laboratory is developing the Transient Reactor Analysis Code (TRAC-PF1) to provide the capability for advanced best-estimate predictions of postulated accidents in pressurized-water reactors (PWRs) and for many thermal-hydraulic experimental facilities. As part of an independent assessment of TRAC-PF1, Loss-of-Fluid Test (LOFT) L6-7/L9-2 is analyzed and compared to the calculated results. Test L6-7 simulated a cooldown transient similar to the Arkansas Nuclear One Unit-2 turbine-trip transient. During the L9-2 phase of the test, the primary-coolant pumps were tripped and natural circulation cooled the core while the plant cooldown continued. The TRAC results matched the test data well during the L6-7 portion of the transient (0.0-324 s). However, during the L9-2 portion the calculated natural-circulation flow rate in the intact loop was much higher than the measured rate.

33296 **(LA-UR—84-1586) Numerical fluid dynamics calculations of nonequilibrium steam-water flows with entrained droplets.** Williams, K.A. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 38p. (CONF-8404146—4). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012439.

From International workshop on fundamental aspects of post-dryout heat transfer; Salt Lake City, UT, USA (2 Apr 1984).

Portions are illegible in microfiche products.

The present work has developed a computational fluid dynamics formulation that efficiently solves the conservation laws for a vapor field, a continuous liquid field, and two dispersed droplet fields. The thermal-hydraulic effects resulting from the exchange of mass, momentum and energy between the vapor and the dispersed droplet phases has been accurately modeled. This work is an advancement of the state-of-the-art for engineering analyses of nonequilibrium steam-water-droplet flows in heated channels. It is particularly applicable for boiling steam-water flows in which it is important to represent the effects of significant thermal nonequilibrium between the vapor and the liquid phases. This work was shown to be in good agreement with unique experimental measurements of significant thermal nonequilibrium between the vapor and dispersed droplets. The tests analyzed covered a range of mass fluxes and wall heating rates, and were all at low pressures where nonequilibrium effects are most pronounced.

33297 **(LA-UR—84-1721) Fast numerical methods in 3-D.** Woodruff, S.B. (Los Alamos National Lab., NM (USA)). May 1984. Contract W-7405-ENG-36. 11p. (CONF-8405188—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012585.

From Engineering faculty meeting; Los Alamos, NM, USA (30 May 1984).

During the past decade, various semi-implicit finite-difference schemes such as that used in version PD2 of the Transient Reactor Analysis Code (TRAC-PD2) have been applied to problems in fluid flow. The stability-enhancing two-step (SETS) method was created to improve the running time of the existing TRAC code with inimal impact on the code structure and results. The SETS method eliminates the material Courant stability limit simply by adding a stabilizer step to the basic semi-implicit equations. The SETS method has been extended successfully to equations for three-dimensional, two-phase flow and the demonstration computer code used for this extension has been written in a form that can be adapted by other researchers. The method currently is being incorporated into our reactor safety systems code to provide the numerical foundation for a multidimensional code that can run faster than real time.

33298 **(NUREG—0090-Vol.6-No.4) Report to Congress on abnormal occurrences, October-December 1983. Vol. 6, No. 4.** (Nuclear Regulatory Commission, Washington, DC (USA). Office for Analysis and Evaluation of Operational Data). May 1984. 30p. NTIS, PC A03/MF A01 - GPO*. Order Number DE84901383.

Portions are illegible in microfiche products.

Section 208 of the Energy Reorganization Act of 1974 identifies an abnormal occurrence as an unscheduled incident or event which the Nuclear Regulatory Commission determines to be significant from the standpoint of public health or safety and requires a quarterly report of such events to be made to Congress. This report covers the period from October 1 to December 31, 1983. The report states that for this report period, there was one abnormal occurrence at the nuclear power plants licensed by the NRC to operate. The item involved generic problems pertaining to a specific manufacturer's emergency diesel generators. There was one abnormal occurrence for the other NRC licensees. The item involved an overexposure of a radiographer. There was one abnormal occurrence reported by an Agreement State. The item involved an overexposure to a radiographer. The report also contains information updating some previously reported abnormal occurrences.

33299 **(NUREG—0776-Suppl.7) Safety evaluation report related to the operation of Susquehanna Steam Electric Station, Units 1 and 2 (Docket Nos. 50-387 and 50-388). Suppl. 7.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). May 1984. 19p. NTIS, PC A02/MF A01 - GPO* $3.00. Order Number DE84901262.

In April 1981, the staff of the Nuclear Regulatory Commission issued its Safety Evaluation Report (NUREG-0776) regarding the application of the Pennsylvania Power and Light Company (the applicant and/or licensee) and the Allegheny Electric Cooperative, Inc. (co-applicant) for licenses to operate the Susquehanna Steam Electric Station, Units 1 and 2, located on a site in Luzerne County, Pennsylvania. This supplement to NUREG-0776 addresses those issues which required resolution prior to allowing Unit 2 operation at power levels exceeding 5% rated power.

33300 **(NUREG—0853-Suppl.3) Safety evaluation report related to the operation of Clinton Power Station, Unit No. 1 (Docket No. 50-461). Suppl. 3.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). May 1984. 41p. NTIS, PC A03/MF AO1 - GPO* $4.00. Order Number DE84901263.

Supplement No. 3 to the Safety Evaluation Report on the application filed by Illinois Power Company, Soyland Power Cooperative, Inc., and Western Illinois Power Cooperative, Inc., as applicants and owners, for a license to operate the Clinton Power Station, Unit No. 1, has been prepared by the Office of Nuclear Reactor Regulation of the US Nuclear Regulatory Commission. The facility is located in Harp Township, DeWitt County, Illinois. This supplement reports the status of certain items that had not been resolved at the time of publication of the Safety Evaluation Report and Supplements No. 1 and 2.

33301 (NUREG—1062) **Dose calculations for severe LWR accident scenarios.** Margulies, T.S.; Martin, J.A. Jr. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). May 1984. 222p. NTIS, PC A10/MF A01 - GPO* $6.50. Order Number DE84901375.

Portions are illegible in microfiche products.

This report presents a set of precalculated doses based on a set of postulated accident releases and intended for use in emergency planning and emergency response. Doses were calculated for the PWR (Pressurized Water Reactor) accident categories of the Reactor Safety Study (WASH-1400) using the CRAC (Calculations of Reactor Accident Consequences) code. Whole body and thyroid doses are presented for a selected set of weather cases. For each weather case these calculations were performed for various times and distances including three different dose pathways - cloud (plume) shine, ground shine and inhalation. During an emergency this information can be useful since it is immediately available for projecting offsite radiological doses based on reactor accident sequence information in the absence of plant measurements of emission rates (source terms). It can be used for emergency drill scenario development as well.

33302 (NUREG/BR—0051-Vol.5-No.6) **Power reactor events, November-December 1983. Volume 5, No. 6.** Massaro, S.A. (ed.). (Nuclear Regulatory Commission, Washington, DC (USA). Office for Analysis and Evaluation of Operational Data). May 1984. 48p. NTIS, PC A03/MF A01 - GPO*. Order Number DE84901373.

This is a bi-monthly newsletter that compiles operating experience information about commercial nuclear power plants. This includes summaries of noteworthy events and listings and/or abstracts of USNRC and other documents that discuss safety-related or possible generic issues. It is intended to feed back some of the lessons learned from operational experience to the various plant personnel.

33303 (NUREG/CP—0048-Vol.5) **Eleventh water reactor safety research information meeting. Volume 5.** Szawlewicz, S.A. (comp.). (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). Jan 1984. 351p. (CONF-8310143—Vol.5). NTIS MF A01 - GPO* $8.00. Order Number DE84900649.

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

Microfiche only, copy does not permit paper copy reproduction.

Separate abstracts were prepared for papers presented in the following areas: (1) Mechanical Engineering; (2) Structural Engineering; (3) Seismic Research Program; (4) Instrumentation and Control Program; and (5) Research on Equipment Survival in Accidents.

33304 (NUREG/CP—0048-Vol.5, pp 1-25) **Overview of pipe breaks from the perspective of operating experience.** Bush, S.H. 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

The purpose of this paper is to give a semi-quantitative overview of pipe cracking. The dearth of information in many light water reactors (LWR's) does not permit quantification other than in certain systems, or where failure occurred by specific mechanisms. Usually, in these cases the manufacturer provided the information. Pipe cracking incidents in pipe sizes below 4 inches have been limited to brief comparisons. Causal mechanisms are tabulated for both BWRs and PWRs. The numbers should be examined in terms of trends not absolutes. IGSCC is a major contributor to BWRs; is significance to PWRs is usually limited to thin-walled austenitics. The incidence of thermal fatigue is quite high in PWRs. Most other failures tend to be random with the possible exception of erosion-cavitation. These failure mechanisms are discussed in more detail in this paper.

33305 (NUREG/CP—0048-Vol.5, pp 26-32) **Elimination of the double-ended guillotine break in primary pipe loops.** Chou, C.K. (Lawrence Livermore National Lab., CA). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

The Load Combination Program at the Lawrence Livermore National Laboratory is currently conducting a probabilistic assessment of the primary coolant piping of all operating nuclear power plants, as well as those under construction. The goal of this assessment is to determine the necessity for including the double-ended guillotine break (DEGB) of primary coolant loops as a design basis load for nuclear power plant design. The DEGB design basis load has been an important loading element greatly affecting many nuclear power plant facility designs either directly or indirectly. The DEGB load also influences plant construction costs and safety margins. This paper is divided into five sections: (1) cost and safety assessments associated with the implementation of DEGB design requirements; (2) LLNL's technical approach in assessing the probability of occurrence of a DEGB design basis event; (3) technical evaluation results; (4) general discussion and conclusions; and (5) related subjects.

33306 (NUREG/CP—0048-Vol.5, pp 33-35) **View of industry on the impact of pipe break criteria.** Bernsen, S.A. 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

Historically, large pipe breaks in the types of materials used and under operating conditions similar to those in light water reactor service have not occurred. Nevertheless, the non-mechanistic assumption of a double ended pipe break of the early sixties, selected for loss of coolant accident analysis purposes, has become a mechanistic criterion for the design and arrangement of high pressure piping systems and their associated supports and enclosures in today's nuclear plants. While it seems reasonable and appropriate to continue to design the Emergency Core Cooling Systems for a range of loss of coolant accidents up to and including those that approximate the area of the largest pipe connected to the reactor vessel and to use this break in determining the loading and temperature rise rate for containment structures and equipment qualification, it no longer seems reasonable to provide precisely engineered break protection for a limited number of potential pipe break locations. This observation is gaining increasing support, particularly as engineering judgment and historical perspectives are being supplemented by both deterministic and probabilistic studies that indicate the potential for large instantaneous breaks in nuclear grade piping systems is virtually incredible. Fracture mechanics analyses support leak-before-break assumptions with wide margins and probabilistic studies indicate potentials for double-ended pipe breaks in the range of less than one in a billion years.

33307 (NUREG/CP—0048-Vol.5, pp 36-45) **Pipe-to-pipe impact tests.** Bampton, M.C.C.; Alzheimer, J.M.; Simonen, F.A.; Friley, J.R. (Pacific Northwest Lab., Richland, WA). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

The objective of the program is to generate experimental data and supporting analyses to evaluate the Nuclear Regulatory Commission's criteria for anticipated damage due to pipe whip. These criteria are contained in the Standard Review Plan 3.6.2 and are stated as follows: An unrestrained whipping pipe should be considered capable of causing circumferential and longitudinal breaks, individually, in impacted pipes of smaller nominal pipe size, and de-

veloping through-wall cracks in equal or larger nominal pipe sizes with thinner wall thickness, except where analytical or experimental, or both, data for the expected range of impact energies demonstrates the capability to withstand the impact without rupture. The set of required data points will be achieved by a sequence of tests and analyses. Analysis methods will be applied to predict the damage to be experienced by a given pipe configuration when impacted by another pipe of a specific configuration and impact velocity. The results of the analyses will be used to select conditions for each test and subsequently the results of each test will be used to establish the accuracy of the analysis methods. Thus, an iteration process will establish the appropriate relations between pipe damage and available impact energy.

33308 (NUREG/CP—0048-Vol.5, pp 46-61) **Scale modeling of reinforced concrete structures subjected to seismic loading.** Dove, R.C. (Los Alamos National Lab., NM). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

Reinforced concrete, Category I structures are so large that the possibility of seismicly testing the prototype structures under controlled conditions is essentially nonexistent. However, experimental data, from which important structural properties can be determined and existing and new methods of seismic analysis benchmarked, are badly needed. As a result, seismic experiments on scaled models are of considerable interest. In this paper, the scaling laws are developed in some detail so that assumptions and choices based on judgement can be clearly recognized and their effects discussed. The scaling laws developed are then used to design a reinforced concrete model of a Category I structure. Finally, how scaling is effected by various types of damping (viscous, structural, and Coulomb) is discussed.

33309 (NUREG/CP—0048-Vol.5, pp 62-96) **Uses of an earthquake simulator.** Sozen, M.A. (Univ. of Illinois, Urbana). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

Earthquake simulation in the laboratory may be defined as the process of moving, at prescribed varying rates of speed, the base of a test structure through a displacement program representing one or several components of a particular earthquake motion. The energy and control requirements for such an undertaking tend to limit the size of the test structure and the number of base motion components in a given test. This restraint leads to a series of compromises which reduce the test structure, not necessarily in size, to a model with all the attendant doubts about its relevance to the real thing. The simulator may be used in two modes: (1) to test a prototype, which may be a small building or a building unit, and (2) to test a theoretical concept represented by a physical model. An example of an actual modelling process is discussed; described are the steps involved in experimental analysis of conditions leading to the failure of a particular building.

33310 (NUREG/CP—0048-Vol.5, pp 97-121) **Design and analysis of concrete structures.** Ucciferro, J.J. 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

This paper presents an overview of the design and analysis of nuclear concrete structures subjected to postulated extreme loads. Although other loadings are addressed, the primary emphasis is on seismic. Both an auxiliary building and a containment building are included in the overview. The latter portion of the paper addresses specific requirements which have produced difficulty as viewed from the perspective of the designer/constructor. Since these requirements appear to be conservative, it is recommended that each identified requirement of the code or regulation be reviewed or additional research be performed.

33311 (NUREG/CP—0048-Vol.5, pp 122-138) **Seismic safety margins research program: an overview.** Bohn, M.P.; Shieh, L.C.; Wells, J.E.; Cover, L.E.; Bernreuter, D.L.; Johnson, J.J. (Lawrence Livermore National Lab., CA; Structural Mechanics Associates, San Ramon, CA). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

To assist the NRC in its licensing and evaluation role, the NRC funded the Seismic Safety Margins Research Program (SSMRP) at LLNL with the goal of developing tools and data bases to evaluate the risk of earthquake-caused radioactive release from a commercial nuclear power plant. This program began late in 1978, and the methodology was finalized in 1982. A complete seismic risk assessment for the Zion plant was finished in May 1983. This paper describes the SSMRP risk assessment methodology and the results of the Zion seismic probabilistic risk assessment.

33312 (NUREG/CP—0048-Vol.5, pp 139-145) **Multiple independent pipe support motions.** Bezler, P.; Subudhi, M.; Wang, Y.K.; Shteyngart, S.; Alforque, R. (Brookhaven National Lab., Upton, NY). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

Efforts under the Mechanical Piping Benchmarks Program have continued through FY 83. Major work areas during this period were the investigation of multiple independent support motion (ISM) analysis methods and the confirmation of analysis methods by the consideration of and comparison to piping test results (physical benchmarks). In the study of ISM analysis methods, response predictions based on ISM response spectrum methods and alternate seismic anchor movement (SAM) analysis methods are compared to ISM time history results for various nuclear power plant piping configurations. Two physical benchmark confirmatory evaluations, the Indian Point Rigid Strut configuration and the Extended Z Bend ANCO test T6R1R, were completed. The former involved the analytical simulation of a snap back test of a feedwater line in the Indian Point Nuclear Power Plant Unit 1. The latter involved the blind prediction of the response of a simple pipe configuration seismically excited by three pipe mounted actuators. The correspondence of results achieved for the snap back test were only fair. The correspondence of results for the Z bend, as assessed by an alternate NRC contractor, were good. The physical benchmarking is being extended to the evaluation of larger and branched systems subjected to multiple independent excitations in a cooperative program between NRC, EPRI and ANCO Engineers, Inc.

33313 (NUREG/CP—0048-Vol.5, pp 146-174) **Engineering characterization of earthquake ground motion for nuclear power plant design.** Kennedy, R.P.; Short, S.A.; Idriss, I.M.; Power, M.S.; Costello, J.F. 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

The basic question considered herein is what free-field ground motion characteristics should be the basis for the design response spectra of nuclear power plants. An observation which has been made by a number of people is that neither instrumental peak acceleration nor the elastic response spectra are good measures of potential seismic damage. The objective of this work is to develop recommendations for methods to be used in selecting design response spectra or time histories to be used to characterize motion at the foundation level of nuclear power plants. The problem of selecting design motions can be divided into two broad parts. The first part consists of choosing translational design criteria based on free-field motions with consideration of the response and performance of nuclear plant structures. The second part consists of choosing translational and rotational design criteria at structure foundation levels with additional considerations given to spatial variations of ground motions with soil-structure interaction. This paper covers the results of Phase I addressing the first part of the problem. Phase II addressing the second part of the problem is currently being performed.

33314 (NUREG/CP—0048-Vol.5, pp 189-205) **Dynamic tests of three-dimensional piping systems: a NRC/EPRI joint test program.** Tang, Y.K.; Tang, H.T. (Electric Power Research Inst., Palo Alto, CA). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

The US Nuclear Regulatory Commission and the Electric Power Research Institute have jointly sponsored a piping research project. The intent of this research effort, which involves design, analysis, fabrication, erection, and dynamic testing of two three-dimensional piping systems, is to provide the following benefits: (1) to expand the limited controlled data base on damping in piping systems at response levels at and above operating basis earthquake (OBE) stress levels; (2) to stimulate recognition of safety margins implicit in ASME code rules for class 2/3 piping by demonstrating the existence of large design margins in piping and support systems when subject to seimsic load far beyond its SSE design stress limit; and (3) to obtain a data base for benchmarking computer methods for analysis of pressurized piping systems with representative support systems and for response levels below and above piping yielding as well as including pipe support failure. In-depth study of the first of two planned test configurations is underway. The tests include: (1) a six-inch diameter main with no branch lines, and (2) a six-inch diameter main with three-inch branch lines.

33315 (NUREG/CP—0048-Vol.5, pp 206-208) **Potential overdesign for the extreme load condition: current Pressure Vessel Research Committee Technical Committee on Piping Systems activities.** Landers, D.F. 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

A major concern of some members of the industry has been the increased rigidity of piping systems resulting from seismic and other dynamic load requirements and the response of the designer to those requirements. Note that the concern is two-fold: (1) requirements and (2) industry response. After years of concern being voiced and the presentation of papers and reports in the public forum the industry formed a special committee under the auspices of the Pressure Vessel Research Committee. This is not to say that substantial activities were not underway or completed by other investigators and organizations because they were. What was needed was an organization to review all the completed and ongoing activities as well as determine those areas which were most susceptible to modification. The Steering Committee on Piping Systems was organized and proceeded to appoint a Technical Committee on Piping Systems (the Committee) to perform the technical review of current data requirements, Codes, Regulations, etc., and make recommendations for modifications. The Steering Committee is an oversight group as well as having significant potential for making changes occur in the appropriate Codes or Regulations. The Committee is currently looking at four major areas: (1) damping values; (2) spectra; (3) dynamic stress criteria; and (4) industry practice.

33316 (NUREG/CP—0048-Vol.5, pp 209-225) **Safety implications of control systems.** Smith, O.L. (Oak Ridge National Lab., TN). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

The Safety Implications of Control Systems (SIOC) Program has three interrelated objectives: (1) to investigate failure modes and effects in non-safety control systems, including single failures and common cause, common mode, cascade, and other credible multiple failures, (2) to assess the impact upon safety of control system designs and their dynamic behavior, using methods that include computer modeling and analysis of system dynamics under stress, and (3) to develop criteria for determining the relative importance of control system influences upon safety, and with these as a basis to recommend design and operational standards for the systems involved. In support of these goals, the SIOC Program consists of three principal activities: (1) an augmented failure mode and effects analysis (FMEA) of the overall plant; (2) specific analysis of the plant electrical system; and (3) a hybrid computer model to augment the FMEA. This paper will discuss the status of each of these activities.

33317 (NUREG/CP—0048-Vol.5, pp 242-254) **Torsional ultrasonic technique for reactor vessel liquid level measurement.** Dress, W.B. (Oak Ridge National Lab., TN). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5). Contract W-7405-ENG-26.

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

A liquid-level sensor based on the ultrasonic technique is a promising long-term solution for monitoring core cooling. An instrument based on the technique can display temperature and density profiles of high resolution along a chosen path through the reactor. The density data can be used to indicate voids (boiling), froth, and actual level as well as collapsed level. Correlation of these parameters with the outputs of other plant sensors provide desired event independence. The continuous nature of the temperature, level, and density information is another advantage of the ultrasonic method over those indicating at a limited number of discrete points. Compatibility with current reactor designs and the ability to perform under both normal and accident conditions is realized by the simple, all metal construction of the sensor, and by isolation of the transducer from the reactor core area.

33318 (NUREG/CP—0048-Vol.5, pp 255-260) **Non-invasive water level measurements at LOFT using a neutron detection system.** Baratta, A.; Jester, W.; Okyere, E.; Gundy, M.; Imel, G.; Kibler, M. (Pennsylvania State Univ., University Park). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

Since the TMI-2 accident, the authors have worked on a concept for a non-invasive liquid level and density gauge. The system under study operates by detecting fast neutrons leaking from the pressure vessel. The intensity of such neutrons has been found to be extremely sensitive to changes in both coolant density and liquid level. Experimental research has been conducted both at the Pennsylvania State University's (PSU) Breazeale Nuclear Reactor (BNR) and at the Loss of Fluid Test Facility (LOFT) at the Idaho National Laboratory. The work to date has demonstrated the feasibility of this concept. This concept resulted from the authors study of the output of the TMI-2 source range detector (SRD) obtained during the accident and the analysis of the core conditions which produce this SRD output as determined by the Nuclear Safety Analysis Center (NSAC).

33319 (NUREG/CP—0048-Vol.5, pp 283-297) **Progress on qualification testing methodology study of electric cables.** Yoshida, K.; Seguchi, T.; Okada, S.; Ito, M.; Kusama, Y.; Yagi, T.; Yoshikawa, M. (Takasaki Radiation Chemistry Research Establishment, Japan). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

Many instrumental, control and power cables are installed in nuclear power plants, and these cables contain a large amount of organic polymers as insulating and jacketing materials. They are exposed to radiation at high dose rate, steam at high temperature and chemical (or water) spray simultaneously when a LOCA occurs. Under such conditions, the polymers tend to lose their original properties. For reactor safety, the cables should be functional even if they are subjected to a loss-of-coolant accident (LOCA) at the end of their intended service life. In Japan, cable manufacturers qualify their cables according to the proposed test standard issued from IEEJ in 1982, but the standard still has many unsolved problems or uncertainties which have been dealt with tentatively through the manufacturer-user's agreement. The objectives of this research are to study the methodologies for qualification testing of electric wires and cables, and to provide the improved technical bases for modification of the standard. Research activities are divided into the Accident (LOCA) Testing Methodology and the Accelerated Aging Methodology.

33320 (NUREG/CP—0048-Vol.5, pp 298-315) **Survey of equipment qualification research activities with respect to LOCA environments.** Bonzon, L.L.; Bustard, L.D. (Sandia National Labs., Albuquerque, NM). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

The intent of the full paper is to set the historical perspective for, and the current status of, the international activities involving safety-related equipment qualification (EQ) research efforts.

33321 (NUREG/CP—0048-Vol.5, pp 324-331) **Relationship of fire protection research to plant safety.** Berry, D.L. (Sandia National Labs., Albuquerque, NM). 1983. NTIS MF A01 - GPO* $8.00. Order Number TI84900649. (CONF-8310143—Vol.5).

From 11. NRC water reactor safety research information meeting; Gaithersburg, MD, USA (14 Oct 1983).

On the basis of fire research completed to date, current fire protection research activities by Sandia National Laboratories and the NRC are focused on the following topics: (1) spatial separation; (2) equipment damageability; (3) cabinet fires; and (4) probabilistic analyses. As discussed in this paper, a number of real-world power plant safety concerns have prompted the need for research to address these topics. Plans call for the use of a combination of analytical and experimental research, with the aim of resolving fire protection uncertainties or, at least, determining the magnitude of the uncertainties. Unanswered issues include: (1) the potential for fire damage (corrosive products, suppression) outside of the room in which a fire is occurring; (2) the safety significance of spurious suppression system actuation as a result of random or nonfire induced circumstances; and (3) the acceptability of using active fire control measures in the absence of purely passive protection schemes.

33322 (NUREG/CR—3310) **Testing of the CONTAIN code.** Sciacca, F.W.; Bergeron, K.D.; Murata, K.K.; Rexroth, P.E. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1984. Contract AC04-76DP00789. 397p. (SAND—83-1149). NTIS, PC A17/MF A01; 1 - GPO; GPO Dep. Order Number DE84013500.

Portions are illegible in microfiche products.

CONTAIN is a large computer code intended for use in the analysis of severe nuclear power plant accidents. Many tests have been conducted on CONTAIN to assess its adequacy for dealing with nuclear-accident problems. This report describes the CONTAIN test program and summarizes the results obtained to date. These results are presented so that users may be aware of the features of CONTAIN that have been checked and of the areas where problems have been identified. In addition, this report provides information needed by users to repeat tests of interest in their specific work areas. The test efforts have identified a substantial number of problems in the coding or logic of the CONTAIN code. Most of these problems have been corrected. These corrections have been included in the most recent versions of the code. CONTAIN can accurately treat most of the phenomena expected to occur in containment atmospheres. Some problems identified by the test program, involving pool-related phenomena, have prompted the development of a substantially new system of models for pool phenomena. When completed, this new system will be subjected to intense testing of the type described here.

33323 (NUREG/CR—3366) **High temperature melt attack on steel and urania-coated steel.** Powers, D.A.; Arellano, F.E. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1984. Contract AC04-76DP00789. 97p. (SAND—83-1350). NTIS, PC A05/MF A01; 1 - GPO; GPO Dep. Order Number DE84013532.

Portions are illegible in microfiche products.

A series of twelve experiments in which high-temperature melts streamed onto steel plates are described. Melts weighing 3 to 5 kg were formed by metallothermic reaction and had the compositions 55 w/o Fe and 45 w/o Al_2O_3 or 54 w/o UO_2, 16 w/o ZrO_2 and 30 w/o stainless steel. Steel plates exposed to the melts were between 0.95 and 1.90 cm thick. Some plates were coated with plasma-sprayed urania to thicknesses up to 2 mm. Stream velocities were varied between 102 and 255 cm/s. Steel plates exposed to the direct action of the melts were readily penetrated. Typical penetration rates were about 1 cm/s. The rate of penetration increased with the velocity of the melt stream. Urania coatings 0.23 and 1.0 mm thick inhibited penetration of the steel. Coatings 2 mm thick prevented penetration of plates exposed to melt for about 5 seconds. Data obtained in these tests and previous tests were used to form a correlation of the time required to penetrate a steel plate of thickness d in terms of melt temperature and melt velocity.

33324 (NUREG/CR—3566) **Socioeconomic consequences of nuclear reactor accidents.** Tawil, J.J.; Callaway, J.W.; Coles, B.L.; Cronin, F.J.; Currie, J.W.; Imhoff, K.L.; Lewis, P.M.; Nesse, R.J.; Strenge, D.L. (Pacific Northwest Lab., Richland, WA (USA)). Jun 1984. Contract AC06-76RL01830. 196p. (PNL—4911). NTIS, PC A09/MF A01; 1 - GPO $6.00; GPO Dep. Order Number DE84013356.

Portions are illegible in microfiche products.

This report identifies and characterizes the off-site socioeconomic consequences that would likely result from a severe radiological accident at a nuclear power plant. The types of impacts that are addressed include economic impacts, health impacts, social/psychological impacts and institutional impacts. These impacts are identified for each of several phases of a reactor accident - from the warning phase through the post-resettlement phase. The relative importance of the impact during each accident phase and the degree to which the impact can be predicted are indicated. The report also examines the methods that are currently used for assessing nuclear reactor accidents, including development of accident scenarios and the estimating of socioeconomic accident consequences with various models. Finally, a critical evaluation is made regarding the use of impact analyses in estimating the contribution of socioeconomic consequences to nuclear accident reactor accident risk. 116 references, 7 figures, 15 tables.

33325 (NUREG/CR—3588) **Effect of LOCA simulation procedures on cross-linked polyolefin cable's performance.** Bustard, L.D. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1984. Contract AC04-76DP00789. 99p. (SAND—83-2406). NTIS, PC A05/MF A01; 1 - GPO; GPO Dep. Order Number DE84013527.

Portions are illegible in microfiche products.

Electrical and mechanical properties of three commercial cross-linked polyolefin (XLPO) materials, typically used as electrical cable insulation, have been monitored during these simulations of nuclear power plant aging and accident stresses. For one XLPO cable accelerated thermal aging is performed, then the samples are irradiated to the combined aging and LOCA total dose. Finally, a steam exposure is applied. For a second and third set of XLPO cables simultaneous applications of elevated temperature and radiation stresses are used to preaccident age specimens. These aging exposures are followed by simultaneous and steam exposures to simulate a LOCA environment. The measurement parameters during these tests included: dc insulation resistance, ac leakage current, ultimate tensile strength, ultimate tensile elongation, percentage dimensional changes, and percentage moisture absorption. Test results for three XLPO materials are presented.

33326 (NUREG/CR—3618) **OCA-P, a deterministic and probabilistic fracture-mechanics code for application to pressure vessels.** Cheverton, R.D.; Ball, D.G. (Oak Ridge National Lab., TN (USA)). May 1984. Contract AC05-84OR21400. 94p. (ORNL—5991). NTIS, PC A05/MF A01 - GPO; GPO Dep. Order Number DE84013064.

The OCA-P code is a probabilistic fracture-mechanics code that was prepared specifically for evaluating the integrity of pressurized-water reactor vessels when subjected to overcooling-accident loading conditions. The code has two-dimensional- and some three-dimensional-flaw capability; it is based on linear-elastic fracture mechanics; and it can treat cladding as a discrete region. Both deterministic and probabilistic analyses can be performed. For the former analysis, it is possible to conduct a search for critical values of the fluence and the nil-ductility reference temperature corresponding to incipient initiation of the initial flaw. The probabilistic portion of OCA-P is based on Monte Carlo techniques, and simulated parameters include fluence, flaw depth, fracture toughness, nil-ductility reference temperature, and concentrations of copper,

nickel, and phosphorous. Plotting capabilities include the construction of critical-crack-depth diagrams (deterministic analysis) and various histograms (probabilistic analysis).

33327 (NUREG/CR—3704) Three-dimensional calculations of transient fluid-thermal mixing in the downcomer of the Calvert Cliffs-1 plant using SOLA-PTS. Daly, B.J. (Los Alamos National Lab., NM (USA)). Apr 1984. Contract W-7405-ENG-36. 87p. (LA—10039-MS). NTIS, PC A05/MF A01; 1 - GPO; GPO Dep. Order Number DE84013530.

Portions are illegible in microfiche products.

The SOLA-PTS code has been used to analyze transient fluid-thermal mixing in a 180° sector of the downcomer and a cold leg of the Calvert Cliffs-1 plant for three assumed accident scenarios. The inlet boundary conditions for these calculations were obtained from mass flow rates and temperatures that were computed in systems code studies. The results of the three-dimensional SOLA-PTS calculations indicated that a pressurized thermal shock risk was mitigated for these accident scenarios as the result of the particular circulation patterns that developed in the downcomer.

33328 (NUREG/CR—3781-Draft) PCI-related cladding failures during off-normal events - draft. Van Houten, R.; Tokar, M.; MacDonald, P.E. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1984. Contract AC07-76ID01570. 113p. (EGG—2313-Draft). NTIS, PC A06/MF A01; 1 - GPO; GPO Dep. Order Number DE84013534.

Portions are illegible in microfiche products.

Pellet-cladding interaction (PCI) has long been identified as a fuel rod failure mechanism during power increases in both pressurized and boiling water reactors, and commercial guidelines have practically eliminated such failures during standard operations. A question remains regarding the possible formation of through-wall cladding cracks during several types of postulated off-normal reactor events involving power increases. This report includes preliminary findings for reactor events of the type addressed by Chapter 15 of the NRC Standard Review Plan. Specifically, the BWR turbine trip without bypass, PWR control rod withdrawal error, subcritical PWR control rod withdrawal error, BWR control blade withdrawal error, and the PWR steamline break are analyzed on the joint bases of peak rod power, power increase, ramp rate, and duration at elevated power. These Chapter 15 events are compared to numerous test reactor results and to other relevant investigations, and tentative conclusions on transient severity and data base adequacy are presented. Progress in developing computer codes for predicting PCI-induced fuel rod failures is also discussed. 49 references.

33329 (PB—84-169754) Development and quarter core PWR rod ejection accident application of the TITAN code. Final report 1982-83. Tsai, C.K.; Griggs, D.P.; Kazimi, M.S.; Henry, A.F. (Massachusetts Inst. of Tech., Cambridge (USA). Energy Lab.). Jun 1983. 137p. (MIT/EL—83-007). NTIS, PC A07/MF A01.

Sponsored in part by Long Island Lighting Co., Mineola, NY., Northeast Utilities Service Co., Hartford, CT., and Yankee Atomic Electric Co., Westboro, MA.

New features have been added to TITAN, which is an advanced 3-D thermohydraulic and neutronic coupled code. The new features include a high order feedback model, a xenon model and a capability to handle nonreactangular (zig-zag) geometry. A central rod ejection accident of a typical 3-loop PWR within 0.1 seconds, was simulated with a quarter-core model, comprising 47 assemblies. The results seem reasonable, although different from MEKIN-B results, reported by BNL. The steady state solutions with and without cross-flow were found to have no significant differences. The calculational speed on the Honeywell Multics machine was roughly .4 cpu seconds (about 1500 cpu seconds on IBM 370/160) for convergence. The transient results show power peaking after 0.12 seconds at about 1.50 the initial power, as opposed to the results predicted by MEKIN-B of a factor of 2.0 rise in power. A user's guide is given as an Appendix to the report.

33330 (PB—84-186931) Seabrook Station probabilistic safety assessment. Summary report. (Pickard-Lowe and Garrick, Inc., Irvine, CA (USA)). Dec 1983. 30p. NTIS, PC A03/MF A01.

See also PB84-186949.; Sponsored in part by Public Service Co. of New Hampshire, Manchester and Yankee Atomic Electric Co., Framingham, MA.

This report documents an independent probabilistic safety assessment of the twin nuclear power plants under construction near Seabrook, New Hampshire. This assessment quantified the risk to public health and safety associated with potential accidents during the period of operation of the station. The project employed an advanced safety assessment discipline known as probabilistic risk assessment and included within its scope all known causes of potential accidents including human error, earthquakes, aircraft crashes, hurricanes, equipment malfunctions, and other causes of potential accidents. The study concluded that when the reactor units are put into operation, there will be a very small increase in both the individual and societal risks within the population surrounding the station. A full quantification of the effects of these uncertainties in the risk estimates has been provided. The most important results of the study are insights about the importance to safety of the design and operation of the plant, and insights about the effectiveneas of emergency plans.

33331 (PB—84-186949) Seabrook Station probabilistic safety assessment. Main report, volumes 1-6 and summary report. (Pickard-Lowe and Garrick, Inc., Irvine, CA (USA)). Dec 1983. 4512p. (PLG—0300). NTIS, MF E15.

Sponsored in part by Public Service Co. of New Hampshire, Manchester and Yankee Atomic Electric Co., Framingham, MA.

This report documents an independent probabilistic safety assessment of the twin nuclear power plants under construction near Seabrook, New Hampshire. This assessment quantified the risk to public health and safety associated with potential accidents during the period of operation of the station. The main report contains the technical analyses of the Seabrook plant and site, the risk modeling and data analysis.

33332 (SAND—83-2330C) Analysis of combustion in closed or vented rooms and vessels. Cummings, J.C.; Lee, J.H.S.; Camp, A.L.; Marx, K.D. (Sandia National Labs., Albuquerque, NM (USA); McGill Univ., Montreal, Quebec (Canada); Sandia National Labs., Livermore, CA (USA)). 1984. Contract AC04-76DP00789. 53p. (CONF-840828—1). It is well recognized that turbulence and acoustic instability play important roles in the pressure development in closed and vented explosions which may render the standard explosion venting guidelines invalid. In the future, more realistic estimates of venting requirements may be obtained through the use of computer models. The present paper reviews the analysis required to predict the pressure history within closed or vented rooms and vessels due to combustion. Computer codes with various levels of detail and sophistication are reviewed. As specific examples, we discuss the details of a simple lumped-parameter computer code called HECTR (which was developed to calculate the transient response - pressures, temperatures, and species concentrations - of a nuclear plant containment building to hydrogen combustion) and a two-dimensional, finite-difference computer code called CONCHAS-SPRAY (which solves the equations for transient, multicomponent, chemically reactive fluid dynamics). Several examples of HECTR and CONCHAS-SPRAY combustion calculations for experimental test vessels and nuclear reactor containment buildings are presented. Finally, we discuss the application of codes like HECTR and CONCHAS-SPRAY to complex situations that might occur during an accident at an industrial plant.

33333 (SAND—83-2393C) Demonstrations and verification of debris bed models in the MEDICI reactor cavity code. Trebilcock, W.R.; Bergeron, K.D.; Gorham-Bergeron, E.D. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 19p. (CONF-840816—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84006104.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

Portions are illegible in microfiche products.

The MEDICI reactor cavity model is under development at Sandia National Laboratories to provide a simple but realistic treatment of ex-vessel severe accident phenomena. Several demonstration cases have been run and are discussed as illustrations of the model's capabilities. Verification of the model with experiments has supplied confidence in the model.

33334 **(SAND—83-2654C) Effects on consequences of the high steam content in LWR accident releases: physics and preliminary results.** Spulak, R.G. Jr.; Boughton, B.A.; Williams, D.C.; Cummings, J.C.; Alpert, D.J.; Richards, C.N.; Dunn, W.E. (Sandia National Labs., Albuquerque, NM (USA); Atmospheric Physics, Inc., Peralta, NM (USA); Illinois Univ., Urbana (USA)). 1984. Contract AC04-76DP00789. 14p. (CONF-840701—12). From Topical meeting on fission product behavior and source term research; Snowbird, UT, USA (15 Jul 1984).

Portions are illegible in microfiche products.

Our research has addressed the possibility that condensation of steam during the release of containment gases and aerosol particles to the atmosphere after a core-melt accident could deposit a significant fraction of the radioactive material near the plant. This paper describes the modeling of accident releases including this rainout and discusses the impact of our findings on risk predictions. Our models include details of the hydrodynamics of the flow from containment, thermodynamics of the release mixture, explicit consideration of condensation on the radioactive aerosols, turbulent agglomeration of aerosols and water droplets, buoyant plume physics, and the dispersion and deposition of drops. We discuss the initial and boundary conditions which lead to significant rainout.

33335 **(SAND—84-0368C) Capabilities of HECTR Version 1.0.** Dingman, S.E.; Camp, A.L.; Wester, M.J. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 22p. (CONF-840813—5). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84006959.

From Design, construction and operation of nuclear power plants conference; Portland, OR, USA (5 Aug 1984).

Portions are illegible in microfiche products.

HECTR (Hydrogen Event: Containment Transient Response) is a computer code that has been developed at Sandia National Laboratories to predict the transient pressure and temperature responses in reactor containments during hypothetical accidents involving hydrogen combustion. The capabilities of HECTR Version 1.0 are described. Example calculations demonstrating the ability of HECTR to model PWR ice-condenser and BWR Mark III containments are presented, along with descriptions of the pertinent models.

33336 **(SAND—84-0722C) Containment release modes, rainout, and risk.** Spulak, R.G. Jr.; Boughton, B.A. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 14p. (CONF-8406124—6). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013055.

From 2. workshop on containment integrity; Washington, DC, USA (13 Jun 1984).

Reactor containment failure due to overpressurization (from generation of steam and noncondensible gases or hydrogen burning) after a core-melt accident will result in the release of the contents of the containment atmosphere to the environment. This research has addressed the possibility that condensation of some of the steam outside the containment could lead to deposition of a significant fraction of the radioactive material near the plant. Three types of release from the containment are considered: a puff from a large-scale rupture, a jet from a discrete hole, and release from a crack or network of fissures or cracks. The physical details of the exit from the containment is different in each case, possibly leading to a different likelihood of condensation and rainout. Each of these releases has been modeled to the point where the material begins to mix with the ambient air. In addition, the jet release has been modeled from this point through entrainment of ambient air, condensation and agglomeration of water droplets, transition to a plume, and deposition of drops on the ground.

33337 **(SAND—84-0798C) Experimental and analytical results of steel containment tests.** Horschel, D.S. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 15p. (CONF-8406124—5). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012960.

From 2. workshop on containment integrity; Washington, DC, USA (13 Jun 1984).

The Containment Integrity Division at Sandia National Laboratories is conducting tests on models of nuclear containment buildings. The tests currently being conducted are on steel containment vessels subjected to quasi-static internal overpressurization. Four 1/32 scale models have been tested by incrementally pressurizing the model until failure or leakage occurs. The testing of the containment models provides both insight and data on the response of containment vessels to overpressurization. The data are used to answer important technical questions that have arisen and to assess the adequacy of analytical methods in predicting containment behavior to accidents more severe than design basis accidents. Some of the details about the tests and the results of the experiments as well as the results of the finite element analyses are presented in this paper. Options selected for the analyses of the containment models accounted for finite strain, elastic-plastic and nonlinear geometric behavior of the containment models. The data obtained during the testing of the models are compared to the analytical results for selected areas.

33338 **(SAND—84-0807C) HECTR results for Ice-Condenser Containment Standard Problem.** Haskin, F.E.; Behr, V.L.; Camp, A.L. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 18p. (CONF-8406124—8). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012810.

From 2. workshop on containment integrity; Washington, DC, USA (13 Jun 1984).

Portions are illegible in microfiche products.

Calculations were performed to study the Ice-Condenser Containment Standard Problem for the NRC Containment Loads Working Group (CLWG). This problem is based on a TMLB' accident sequence. TMLB' denotes a transient-initiated accident in which there is total failure of both ac power and feedwater to the steam generators. MARCH 2 and CORCON Mod2 were used to predict the steam, hydrogen, carbon dioxide, and carbon monoxide sources. HECTR was used to predict the containment pressure temperature response. The results of calculations include quantitative indications of the sensitivity of containment pressure-temperature loadings to the gas source terms, the ignition criteria, and the magnitude of the steam spike following vessel breach.

33339 **(SAND—84-0839C) Procedures and objectives for testing a 1/8 scale model of a steel containment.** Koenig, L.N. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 9p. (CONF-8406124—7). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012550.

From 2. workshop on containment integrity; Washington, DC, USA (13 Jun 1984).

A 1/8 scale model of a steel containment building will be tested in late summer of this year by the Containment Integrity Division of Sandia National Laboratories, Albuquerque, NM. Included in the model are pipe penetrations, personnel locks, and operable equipment hatches. The 1/8 scale model will be pressurized in steps to well above the design pressure and data taken at each step via a computer controlled data acquisition system. Strain gages, thermocouples, and displacement and pressure transducers have been placed strategically throughout the inside and outside of the model to record data on the model's response to each pressure step. Particular effort has gone into instrumenting the area around and near penetrations although regions away from penetrations are also instrumented for comparison purposes.

33340 **(SAND—84-1233C) CONTAIN calculations of containment loading of dry PWR's.** Bergeron, K.D.; Williams, D.C. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 14p. (CONF-8406124—4). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012901.

From 2. workshop on containment integrity; Washington, DC, USA (13 Jun 1984).

As part of the NRC's effort to re-evaluate the severe accident source term, two experts' groups have been formed to consolidate information and assess the state of the art in key phenomenological areas. These are the Containment Performance Working Group (CPWG), and the Containment Loads Working Group (CLWG). The CONTAIN code has been used extensively in support of the latter group to calculate pressure and temperature loads for a variety of phenomenological scenarios for core melt accidents at two reference plants, subject to standard problem constraints established by the CLWG. The two plants are a large dry PWR (resembling Zion) and a subatmospheric PWR (resembling Surry). The accident sequence in both cases was TMLB'. Results are presented.

33341 **Nuclear reactors: powering our space future.** Buden, D.; Sullivan, J.A. (Los Alamos National Lab., NM). *Environment;* **26**: No. 1, 7-13, 36-38(Jan-Feb 1984).

Fission reactors are the logical choice for meeting the energy needs of future U.S. space missions. The past, present, and proposed space nuclear reactor programs are reviewed. The safety associated with them, as well as the U.S. and U.N. requirements designed to prevent radioactive contamination of the environment are discussed. In order to assure radiological safety, the SP-100 space nuclear power plants are programmed with long orbital lifetimes, which delay re-entry and allow time for radioactive decay. Accidents at the time of launch and concerns about reentry of the nuclear reactor after it has been operated for some time in space are presented. The review and implementation procedures used to assure that a nuclear reactor designed for launch into space conforms to all of the safety criteria and philosophy that the U.S. has adopted are outlined.

33342 **Recriticality considerations in disrupted gas-cooled fast reactor core geometry.** Rahnema, F.; Ahmad, S.A.; Kastenberg, W.E.; Pomraning, G.C. (University of California, Los Angeles School of Engineering and Applied Science, Los Angeles, California 90024). *Nuclear Technology;* **59**: No. 2, 246-255(Nov 1982).

The margin to criticality of selected distorted core configurations derived from the hypothetical loss of shutdown cooling accident in a 300-MW(electric) gas-cooled fast reactor has been investigated using two-dimensional transport theory. Configurations representing crumbled cores declad fuel columns in nearly intact geometry, and partial slumping of the fuel on the core floor with subsequent radial spreading have been studied. Three minimum postulated conditions for recriticality have been identified for the configurations characterized by declad fuel in nearly intact geometry: If the fuel is fully compacted (no spaces among the crumbled fuel pieces), then 55% of the fuel rods in the core must crumble for recriticality. If 65% of the volume in the crumbled fuel region is space occupied by fuel, then 46% of the fuel rods must be crumbled (with the remaining 54% standing erect but declad). If 28% of the volume in the crumbled fuel bed is space occupied by fuel, then 82% of the rods must crumble for recriticality. For cores that are postulated to melt and slump in a radially outward progression, the reactivity changes from a "safe shutdown" with K /SUB eff/ = 0.93 to supercritical with K /SUB eff/ = 1.103. If the compact, but molten, core spreads radially outward, the reactivity decreases to K /SUB eff/ = 1.041.

33343 **A method for propagating uncertainty in probabilistic risk assessment.** Ahmed, S.; Clark, R.E.; Metcalf, D.R. (Babcock & Wilcox Company, Nuclear Power Generation Division Lynchburg, Virginia 24505). *Nuclear Technology;* **59**: No. 2, 238-245(Nov 1982).

A method is developed to propagate uncertainties in the basic event unavailabilities through a logic model to obtain the transient overpower event unavailability. The method consists of combining probability distributions in the discrete form without performing any sampling. The results are shown to be sufficiently accurate and contain no sampling errors; the computation time is considerably less compared to Monte Carlo simulation and histogram propagation. Uncertainty propagation methods are found to be sensitive to the spread of the basic event unavailability distributions; the proposed method produces results less conservative compared to those from propagation of moments or Monte Carlo simulation.

33344 **Limit lines for risk.** Cox, D.C.; Baybutt, P. (Battelle Columbus Laboratories, 505 King Avenue Columbus, Ohio 43201). *Nuclear Technology;* **57**: No. 3, 320-330(Jun 1982).

Approaches to the regulation of risk from technological systems, such as nuclear power plants or chemical process plants, in which potential accidents may result in a broad range of adverse consequences must take into account several different aspects of risk. These include overall or average risk, accidents posing high relative risks, the rate at which accident probability decreases with increasing accident consequences, and the impact of high frequency, low consequence accidents. A hypothetical complementary cumulative distribution function (CCDF), with appropriately chosen parametric form, meets all these requirements. The Farmer limit line, by contrast, places limits on the risks due to individual accident sequences, and cannot adequately account for overall risk. This reduces its usefulness as a regulatory tool. In practice, the CCDF is used in the Canadian nuclear licensing process, while the Farmer limit line approach, supplemented by separate qualitative limits on overall risk, is employed in the United Kingdom.

33345 **Uncertainty analysis of time-dependent nonlinear systems: theory and application to transient thermal hydraulics.** Barhen, J.; Bjerke, M.A.; Cacuci, D.G.; Mullins, C.B.; Wagschal, G.G. (Oak Ridge National Laboratory, P.O. Box X Oak Ridge, Tennessee 37830). *Nuclear Science and Engineering;* **81**: No. 1, 23-44(May 1982). Contract W-7405-ENG-26.

An advanced methodology for performing systematic uncertainty analysis of time-dependent nonlinear systems is presented. This methodology includes a capability for reducing uncertainties in system parameters and responses by using Bayesian inference techniques to consistently combine prior knowledge with additional experimental information. The determination of best estimates for the system parameters, for the responses, and for their respective covariances is treated as a time-dependent constrained minimization problem. Three alternative formalisms for solving this problem are developed. The two "off-line" formalisms, with and without "foresight" characteristics, require the generation of a complete sensitivity data base prior to performing the uncertainty analysis. The "online" formalism, in which uncertainty analysis is performed interactively with the system analysis code, is best suited for treatment of large-scale highly nonlinear time-dependent problems. This methodology is applied to the uncertainty analysis of a transient upflow of a high pressure water heat transfer experiment. For comparison, an uncertainty analysis using sensitivities computed by standard response surface techniques is also performed. The results of the analysis indicate the following. Major reduction of the discrepancies in the calculation/experiment ratios is achieved by using the new methodology. Incorporation of in-bundle measurements in the uncertainty analysis significantly reduces system uncertainties. Accuracy of sensitivities generated by response-surface techniques should be carefully assessed prior to using them as a basis for uncertainty analyses of transient reactor safety problems.

33346 **Code assessment by a two-phase nozzle flow experiment.** Kedziur, F. (Kernforschungszentrum Karlsruhe GmbH, Institut fur Reaktorentwicklung (IRE) Postfach 3640, D-7500 Karlsruhe 1). *Nuclear Science and Engineering;* **81**: No. 1, 9-22(May 1982).

Stationary two-phase flow experiments at pressures up to 13 MPa and temperatures up to 600 K have been performed in a converging nozzle. The experiment is specially designed for the assessment of two-phase computer codes used in reactor safety analysis, in particular for loss-of-coolant accident blowdown calculations. An assessment by the codes DUESE, DRIX-2D, and RELAP4/MOD6 is reported. The shape of the nozzle, the instrumentation, and the experimental program are such that models and empirical parameters of a wide range of codes can be tested and determined, respectively. Results show the influence and magnitude of models and parameter variations, the effect of the dimensionality and the

difference scheme of the code, and the relevance of the models as a function of the initial conditions.

33347 **ROSA-III base test series for a large break loss-of-coolant accident in a boiling water reactor.** Tasaka, K.; Abe, N.; Anoda, Y.; Koizumi, Y.; Shiba, M. (Japan Atomic Energy Research Institute Tokai-mura, Ibaraki-ken 319-11). *Nuclear Technology;* **57**: No. 2, 179-191(May 1982).

The rig of safety assessment (ROSA)-III facility is a volumetrically scaled (1/424) boiling water reactor (BWR) system with an electrically heated core designed for integral loss-of-coolant accident (LOCA) and emergency core cooling system (ECCS) tests. It is confirmed from the experimental results obtained so far that the ROSA-III test facility can simulate major aspects of a BWR LOCA, such as boiling transition by lowering of the mixture level in the core, rewetting by the lower plenum flashing, and final quenching by the ECCS. The overall agreement between the calculated results by the RELAP5/ MOD0 code and the experimental results is good; however, the calculated lower plenum flashing rewetted the whole core and the calculated cladding temperature considerably underpredicts the measured value at the upper part of the core.

33348 **A liquid-metal fast breeder reactor core design with seed blanket modular assemblies.** Sehgal, B.R.; Fuller, E.L.; Lin, C. (Electric Power Research Institute 3412 Hillview Avenue, Palo Alto, CA 94303). *Nuclear Technology;* **57**: No. 2, 149-162(May 1982).

A liquid-metal fast breeder reactor core design employing seed-blanket-type modular assemblies is presented. The seed region contains PuO_2-UO_2 fuel and the blanket region contains depleted UO_2 fuel. These assemblies constitute the inner core while conventional mixed-oxide assemblies are employed in the outer core region. The results of design studies and analysis show that a large reduction in the sodium void reactivity can be obtained. The core fissile loading is larger than that for a homogeneous core. The analysis of an unprotected loss-of-flow (LOF) accident shows drastically reduced potential for a LOF-driven transient overpower accident. These results and conclusions are similar to those obtained for other heterogeneous core designs.

33349 **RETRAN analysis of the turbine trip tests performed at the Peach Bottom Atomic Power Station Unit 2.** Hornyik, K.; Naser, J.A. (Oregon State University, Corvallis, Oregon). *Nuclear Technology;* **57**: No. 1, 36-49(Apr 1982).

A model based on the RETRAN code was developed for analyzing the turbine trip tests performed at the Peach Bottom Atomic Power Station Unit 2, near the end of the second fuel cycle. Special features of the model include a detailed nodal description of the steam lines and the steam bypass system as needed to properly describe pressure wave phenomena caused by stop valve closure during the early phase of the transient, and dynamic effects associated with operation of the bypass. Furthermore, it is shown that the power excursion, deliberately enhanced by delayed scram, is strongly influenced by the nature of the pressure wave as it appears in the core region and by direct moderator heating effects. Good agreement between measured transients and most calculated counterparts makes this effort an important contribution toward qualification of RETRAN for this class of transients.

33350 **An assessment of TRAC-PD2 refill calculations based on Creare countercurrent flow tests.** Bott, T.F. (Los Alamos National Laboratory, Energy Division P.O. Box 1663, MS 553, Los Alamos, New Mexico 87545). *Nuclear Technology;* **57**: No. 1, 134-139(Apr 1982).

An important step in computer code development is the assessment of code capabilities through comparison of calculated results with experimental data A number of Creare countercurrent flow tests were simulated with the Transient Reactor Analysis Code (TRAC)-PD2 code to assess the emergency core coolant (ECC) lower plenum penetration and refill predictive capabilities. The tests examined in this study indicate a prediction of complete bypass and delivery at countercurrent steam flows where these phenomena occurred experimentally. Steam flows leading to partial delivery experimentally did not always lead to partial delivery in the calculations, however. A number of parameters can potentially effect TRAC refill calculations. Sensitivity studies indicate the TRAC results are most sensitive to droplet Weber number variations that affect interfacial shear and heat transfer rates. The condensation model also affects calculations with subcooled ECC liquid.

33351 **EROS: an Experimental Breeder Reactor II operational safety code.** Dean, E.M.; Larson, H.A. (Argonne National Laboratory, P.O. Box 2528, Idaho Falls, Idaho 83401). *Nuclear Technology;* **57**: No. 1, 7-19(Apr 1982).

The EROS computer code is described as a verified program for operational safety reactor events in the normal operating or mild upset range of Experimental Breeder Reactor II (EBR-II). Following a description of EROS, several cases of verification of experimental events with the code are presented. The code is found to adequately represent reactivity perturbations in EBR-II including operational rod drops, control rod drops, and oscillator experiments. In addition, the code will interpret flow-coastdown (loss-of-pumping-power) events with great accuracy.

33352 **Behavior of impregnated charcoal filters during a two-stage accident.** Bohm, L. (Delpstrasse 3, 6940 Weinheim). *Nuclear Technology;* **56**: No. 3, 422-425(Mar 1982).

A semi-empirical model is developed that shows iodine filter behavior under normal and anomalous conditions. A two-stage accident is assumed in a 300-MW(electric) liquid-metal fast breeder reactor (LMFBR). Normal behavior is expected when there is a 10 to 30% adsorption of the inventory of ^{131}I, released during a core meltdown of the LMFBR. No serious rise in temperature and desorption is expected in the filter under normal conditions. Under anomalous conditions, however, i.e., when $>60\%$ of the ^{131}I that is released is adsorbed in the filter, high desorption and probably burning of the charcoal may result.

33353 **Transition boiling heat transfer in the Semiscale MOD-3 core during reflood.** Loomis, G.G.; Shumway, R.W. (EG & G Idaho, Inc. Idaho National Engineering Laboratory, Idaho Falls, Idaho 83415). *Nuclear Technology;* **56**: No. 3, 426-433(Mar 1982).

Transition boiling heat transfer data from Semiscale Mod-3 gravity feed reflood experiments have been compared to existing transition boiling correlations. The existing correlations were found to be inadequate for predicting the Semiscale rod bundle data; therefore, a new correlation for transition boiling was developed. The new correlation is applicable for boiling water with stainless steel, electrically heated vertical rods in a pressure range of 138 to 414 kPa. When the new transition boiling correlation is combined with the Berenson film boiling correlation, a good fit to Semiscale reflood data results.

33354 **Gap conductance and temperature transients in modified pulse design experiments.** Chandola, V.K.; Loyalka, S.K. (University of Missouri-Columbia, Nuclear Engineering Department Columbia, Missouri 65211). *Nuclear Technology;* **56**: No. 3, 434-446(Mar 1982).

Computation of nuclear reactor fuel behavior under normal and off-normal conditions is influenced by gap conductance models. In this paper the gap conductance results obtained by the use of the GAPHTR model and a new model that has a more sound theoretical basis in the jump regime are compared for small gaps with the modified pulse design experimental data. The new model is found to provide a better and more satisfactory prediction of the experimental data.

33355 **The DSNP simulation language and its application to liquid-metal fast breeder reactor transient analyses.** Saphier, D.; Madell, J.T. (Soreq Nuclear Research Centre, Yavne). *Nuclear Technology;* **56**: No. 3, 493-506(Mar 1982).

A new, special purpose block-oriented simulation language, the Dynamic Simulator for Nuclear Power Plants (DSNP), was used to perform a dynamic analysis of several conceptual design studies of liquid metal fast breeder reactors. The DSNP being a high level language enables the user to transform a power plant flow chart directly into a simulation program using a small number

of DSNP statements. In addition to the language statements, the DSNP system has its own precompiler and an extensive library containing models of power plant components, algorithms of physical processes, material property functions, and various auxiliary functions. The comparative analysis covered oxide-fueled versus metal-fueled core designs and loop- versus pool-type reactors. The question of interest was the rate of change of the temperatures in the components in the upper plenum and the primary loop, in particular the reactor outlet nozzle and the intermediate heat exchanger inlet nozzle during different types of transients. From the simulations performed it can be concluded that metal-fueled cores will have much faster temperature transients than oxide-fueled cores due mainly to the much higher thermal diffusivity of the metal fuel. The transients in the pool-type design (either with oxide fuel or metal fuel) will be much slower than in the loop-type design due to the large heat capacity of the sodium pool. The DSNP language was demonstrated to be well suited to perform many types of transient analysis in nuclear power plants.

33356 **The prediction of transient fission-gas release and fuel microcracking under severe core-accident conditions.** Rest, J. (Argonne National Laboratory, Materials Science Division Argonne, Illinois 60439). *Nuclear Technology;* **56**: No. 3, 553-564(Mar 1982).

The interrelationship between fuel fracturing (microcracking), temperature scenario, and fissiongas-bubble response is investigated. The fission-gasbubble behavior is described using the FASTGRASS computer code. A model, based on the work of DiMelfi and Deitrich describing ductile/brittle fuel behavior, has been incorporated into the FASTGRASS analysis. The predictions of fission-gas release, radial distribution of released gas, radial distribution of microcracking, and fuel temperatures are compared with the results of transient direct-electrical-heating experiments on irradiated light water reactor fuel. Finally, results of analyses for Three Mile Island Unit 2 type accident conditions are presented and implications for microcracking and fission-gas behavior during this accident are discussed.

33357 **The effect of time delays in fuel pin failure on LOF-TOP transient calculations for a commercial-sized LMFBR.** Pizzica, P.A.; Hummel, H.H. (Argonne National Laboratory, 9700 S. Cass Ave., Argonne, Illinois 60439). *Nuclear Technology;* **56**: No. 2, 313-321(Feb 1982).

Various loss-of-flow cases have been calculated for a commercial-sized liquid-metal fast breeder reactor. Particular attention has been paid to the development of loss-of-flow-driven transient-overpower (LOF-TOP) conditions. In such conditions, it is crucial to consider when an initial cladding breach might occur in LOF-TOP pins and over what length of time the initial cladding breach might extend in fuel pins failing under burst pressure. This study shows that the neutronic energy deposition in transient calculations including LOF-TOP pin failures can increase substantially compared to a calculation excluding such LOF-TOP failures in two ways. First, there will be an increase if there is no extension of an initial cladding failure in LOF-TOP pins or if there is a relatively long delay in the extension. Secondly, when, in applying a fuel melt fraction criterion for pin failure, the same melt fraction is specified for failure extension as for initial failure, which implies a certain delay time for failure extension, there will be an increase in the energy deposition compared to the case without any LOF-TOP failures only when the specified fuel melt fraction becomes very large. However, even in the case with the largest failure melt fraction, there will be no increase in energy deposition when a rapid enough failure extension is assumed. These calculations make a number of very conservative assumptions. The purpose of the study is not to provide a best estimate of accident conditions but to show how quickly an initial cladding breach must extend in such conservative calculations if it is to limit the increase in neutronic energy deposition.

33358 **Analyzing the rod drop accident in a boiling water reactor.** Cheng, H.S.; Diamond, D.J. (Brookhaven National Laboratory, Department of Nuclear Energy Upton, New York 11973). *Nuclear Technology;* **56**: No. 1, 40-54(Jan 1982).

The center rod drop accident was calculated for a boiling water reactor using the two-dimensional (R,Z) core dynamics code BNL-TWIGL. Analysts frequently neglect moderator feedback under the assumption that it leads to conservative results. The present study shows that the peak of the power burst and peak fuel enthalpy can indeed be reduced by a factor of 2 or more by including this effect. The magnitude of the effect depends on reactor conditions. Moderator feedback is particularly important when there are voids in the core initially (i.e., at power conditions) or when the core is near saturation condition. When the reactor is initially at zero power and considerably subcooled, moderator feedback will influence the power peak by $< 10\%$ but will have a much larger effect on the peak fuel enthalpy, which occurs later in time. The moderator feedback is the result of heat conducted from the fuel rod and direct energy deposition. At power conditions, the time constant for heat conduction is small and this is the primary mechanism for changing the steam void content during the accident. At zero power, the initial thermal constant is very large and, hence, any generation of voids at short times is due to direct energy deposition in the moderator. The effect of a different initial power level, flow rate, and inlet subcooling, as well as the effect of delayed neutron fraction, rod drop speed, and accident rod worth, was calculated. In all cases, with moderator feedback accounted for, the maximum fuel enthalpy during the accident is well below presently established limits. Accident consequences are insensitive to the delayed neutron fraction and rod drop velocity. The parameters of most significance are inlet subcooling and accident rod worth.

33359 **The critical safety functions and plant operation.** Corcoran, W.R.; Church, J.F.; Cross, M.T.; Guinn, W.M.; Porter, N.J. (Combustion Engineering, Inc., 1000 Prospect Hill Road Windsor, Connecticut 06095). *Nuclear Technology;* **55**: No. 3, 690-712(Dec 1981).

The operator's role in nuclear safety is outlined and the concept of "safety functions" introduced. Safety functions are a group of actions that prevent core melt or minimize radiation releases to the general public. They can be used to provide a hierarchy of practical plant protection that an operator should use. The plant safety evaluation uses four inputs in predicting the results of an event: the event initiator, the plant design, the initial plant conditions and setup, and the operator actions. If any of these inputs are not as assumed in the evaluation, confidence that the consequences will be as predicted is reduced. Based on the safety evaluation, the operator has three roles in assuring that the consequences of an event will be no worse than the predicted acceptable results: Maintain plant setup in readiness to properly respond. Operate the plant in a manner such that fewer, milder events minimize the frequency and the severity of adverse events. Monitor the plant to verify that the safety functions are accomplished. The operator needs a systematic approach to mitigating the consequences of an event. The concept of safety functions introduces this systematic approach and presents a hierarchy of protection. If the operator has difficulty identifying an event for any reason, the systematic safety function approach allows accomplishing the overall path of mitigating consequences. Ten functions designed to protect against core melt, preserve containment integrity, prevent indirect release of radioactivity, and maintain vital auxiliaries needed to support the other safety functions are identified.

33360 **Probability level of readiness in supervised protective systems for nuclear reactors.** Kontoleon, J.M. (University of Wollongong, Department of Electrical Engineering Wollongong, New South Wales 2500). *Nuclear Science and Engineering;* **73**: No. 1, 84-86(Jan 1980).

The readiness of supervised protective systems for nuclear reactors is analyzed by the use of a four-state Markov process. The supervisions are short and reveal the capability of the system to initiate the protection action. When this capability--defined as the probability of initiating the protection action-is found to be below an acceptable level, the reactor is shut down. The analysis interrelates the probability level of readiness with the desired readiness of the protection system and its rate of supervision.

33361 **(PB—84-169200) Stored energy management for regenerative braking applications.** Russell, F.M. (Rutherford Appleton Lab., Chilton (UK)). 1984. 14p. (RL—83-128). NTIS, PC E03/MF E03.

The use of regenerative braking devices to conserve energy during repeated speed changes of vehicles is well known. Practical systems based on electrical energy storage in batteries and kinetic energy storage in flywheels have been developed to the commercial stage. The alternative of a pneumatic system using compressed air storage is examined here. A procedure involving stored energy management is proposed which beneficially increases both the volume density of energy storage and the volume power density of the associated compressor/expander unit.

2504 Capacitor Banks

33362 **(SAND—84-0269C) 50 kJ repetitively pulsed capacitor bank.** Robwein, G.J. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 10p. (CONF-8406137—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012959.

From 16. power modulator symposium; Arlington, VA, USA (17 Jun 1984).

Portions are illegible in microfiche products.

A 50 kJ capacitor bank designed for continuous rep-rated operation has been built and tested. The bank is a low inductance dual polarity arrangement with 26 parallel spark gap switches. The multiple switches and isolated capacitor pairs contribute to long life and high operational reliability, which were two primary design goals.

33363 **(DFVLR-FB—84-03) Development of media for dynamic latent heat storage for the low temperature range. Pt. 1.** Kanwischer, H.; Tamme, R. (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Stuttgart (Germany, F.R.). Inst. fuer Technische Physik). 1984. 75p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751770.

Portions are illegible in microfiche products.

The results of the thermoanalytically measured phase change temperatures and phase change enthalpies of seventeen salt hydrates, three double salts, and four eutectics are reported. Good results are obtained especially for congruently melting salt hydrates. Incongruently melting salt hydrates appear less suitable for heat storage applications. The influence of the second phase - water, acid, and hydroxide - to the latent heat is described. From the results, basic values of the working temperatures and storage capacities of various storage media compositions may be derived.

33364 **(FRNC-TH—1459) Study of aquifer storage: conductive modelling of a radial symmetry system in a stratified medium.** Lamant, D. (Ecole Centrale des Arts et Manufactures, 92 - Chatenay-Malabry (France)). Sep 1983. 219p. (In French). NTIS (US Sales Only), PC A10/MF A01. Order Number DE84751732.

Portions are illegible in microfiche products.

In this report, various kind of numerical modelling or analytical modelling of aquifer thermal energy storage are listed, insisting for each description on the physical (thermal and hydraulic) phenomena involved and on the limits of the description. The main influent parameters for conduction and convection heat transfer are pointed out. Their relative influence is investigated. A new code is developed to take into account the influence of horizontal impervious layers or heterogeneities in the aquifer.

33365 **(IKE—5-218) Theoretical and experimental investigation of the thermal behaviour of a high-temperature latent heat storage system with sodium nitrate as heat storage medium.** Gadhia, B. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). Jan 1984. 146p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84751773.

Portions are illegible in microfiche products.

The theoretical analysis employs a quasi-two-dimensional mathematical model which includes a specially developed iteration method. The mathematical model was used to investigate the freezing behaviour of the storage medium surrounding a long gas cooled heat exchanger tube imbedded in the tube-and-shell-type storage system. The experimental investigations cover melting and freezing experiments with different mass flow rates of air as heat exchange medium flowing in the tube. The total height of the storage system is about 1,58 m and its diamter is 0,1 m. The diameter of the coaxially arranged heat exchanger tube is 0.025 m. The storage system is filled with about 24,5 kg of sodium nitrate. The total thermal capacity (latent heat + sensible heat) of the storage system is 14330 kJ (i.e. 4,0 kWh) within the operating temperature range from 50°C to 350°C. Experiments were also conducted to determine the heat losses by cooling the storage system through natural convection (i.e. heat loss through insulation only).

33366 **(PNL—5067) Seasonal thermal energy storage.** Allen, R.D.; Kannberg, L.D.; Raymond, J.R. (Pacific Northwest Lab., Richland, WA (USA)). May 1984. Contract AC06-76RL01830. 123p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013854.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report describes the following: (1) the US Department of Energy Seasonal Thermal Energy Storage Program, (2) aquifer thermal energy storage technology, (3) alternative STES technology, (4) foreign studies in seasonal thermal energy storage, and (5) economic assessment.

33367 **(PNL—5127) Underground Energy Storage Program. 1983 annual summary.** Kannberg, L.D. (Pacific Northwest Lab., Richland, WA (USA)). Jun 1984. Contract AC06-76RL01830. 52p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013628.

The Underground Energy Storage Program approach, structure, history, and milestones are described. Technical activities and progress in the Seasonal Thermal Energy Storage and Compressed Air Energy Storage components of the program are then summarized, documenting the work performed and progress made toward resolving and eliminating technical and economic barriers associated with those technologies. 33368 **(AD-A—138791/9) Use of a polyacetylene cathode in primary lithium-thionyl chloride cells.** (Geo-Centers, Inc., Newton Upper Falls, MA (USA)). Oct 1983. 64p. (GC-TR—83-281). NTIS, PC A04/MF A01.

This report describes the work performed for the Navy with regard to the use of poly(acetylene), (CH)x, as a cathode material in a lithium/thionyl ($Li/SOCl_2$) battery. The objective of the project was three fold: (1) To characterize and understand the electrochemistry of (CH)x in a detailed manner, (2) To study the com-

patibility of (CH)x with $SOCl_2$ and (3) To synthesize and investigate 'modified' (CH)x polymers which may possess more desirable properties than the parent polymer.

33369 **(CONF-840677—1) Testing activities at the National Battery Test Laboratory.** Hornstra, F.; DeLuca, W.H.; Gay, E.C.; Yao, N.P. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013435.

From 6. DOE battery and electrochemical contractors' conference; Washington, DC, USA (25 Jun 1984).

Portions are illegible in microfiche products.

The project objective is to acquire and to provide information on battery performance and lifetime under uniform test conditions and conditions that simulate load profiles in the intended application; to determine the effects of temperature and depths of discharge on performance and lifetime; to provide data for battery analyses and modeling; and to provide other information as required by the ongoing battery development program.

33370 **(CONF-840677—2) Glass electrolytes.** (Argonne National Lab., IL (USA)). 25 Jun 1984. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013428.

From 6. DOE battery and electrochemical contractors' conference; Washington, DC, USA (25 Jun 1984).

Portions are illegible in microfiche products.

The objective of this research is a glass electrolyte for use in sodium/sulfur batteries that has a low resistivity (100 ohm-cm at 300°C) and is stable in the cell environment. Experiments in this program are focussed on glasses in the quaternary system: soda, alumina, zirconia and silica. The FY 1983 research on glass analogs of NASICON, parallel thermodynamic calculations, and a review of the literature in the areas of glass conductivity and corrosion resistance led to selection of this system for more detailed investigation. The main program elements are: (1) conductivity measurements at 300 to 500°C; (2) differential thermal analysis for determination of glass-transition and crystallization temperatures; (3) static corrosion tests at 400°C using Na, Na_2S_4, and S; (4) mechanical strength and fracture toughness measurements; and (5) sodium/sulfur cell tests at 350°C. Elements (1) and (2) are nearly completed; element (3) is being initiated using the glasses prepared for (1) and (2), and elements (4) and (5) will begin in the first and second quarters of FY 1985, respectively. Fourteen quaternary glasses having a broad range of compositions have been made. The resistivities of these glasses at 300°C extended from 130 to 3704 ohm-cm; the activation energies for conduction extended from 0.488 to 0.684 eV, and the glass transition temperatures extended from 397 to 685°C. Through a multiple linear regression analysis of these data response surfaces were generated for resistivity, activation energy for conduction, and glass transition temperature over the composition region within the quaternary system that is bounded by SiO_2, Na_2O_3, Na_2AlO_4 and Na_2ZrO_3. These response surfaces indicated a new region of high conductivity and high glass transition temperature in the neighborhood of 42% soda, 31% silica and 27% alumina plus zirconia.

33371 **(CONF-840677—3) Lithium-alloy/metal sulfide battery research.** Redey, L. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013427.

From 6. DOE battery and electrochemical contractors' conference; Washington, DC, USA (25 Jun 1984).

The results of measurements on small electrodes in the half-cell experiments and on large electrodes (50 to 160 cm^2) in compact cell studies (ANL results reported in 1979 to 1982) have been proven comparable in terms of area-specific resistances of the electrode bed. Also, post-test optical analysis showed comparable microstructure of the small and large electrodes. The measured area-specific resistances and capacities of the ternary Li-Al-Si alloy and the iron and nickel sulfide electrodes with high-sulfur activity indicate a possibility for designing a new generation of Li-alloy/metal sulfide cells. With proper combination of the tested active materials and electrolytes, a 50 to 100% performance increase relative to the Li-Al/FeS cells can be expected. Cell designs are being developed to study the interaction of the positive and negative electrodes (capacity matching, self discharge) in small compact cells. These studies, to be initiated in the near future, will provide the basis for selection of an optimum combination of the chemical compositions and loading densities of electrodes.

33372 **(CONF-840677—Suppl.) Project summaries: sixth DOE electrochemical contractor's review. Supplement.** (Battelle Columbus Labs., OH (USA); Pacific Northwest Lab., Richland, WA (USA)). Jun 1984. Contract AC06-76RL01830. 115p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013678.

From 6. DOE battery and electrochemical contractors' conference; Washington, DC, USA (25 Jun 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This document represents a compilation of project summaries of research supported by the Electrochemical Storage Program from January 1983 through June 1984. It is intended to be a technical overview for engineers and scientists in government, industry and academia who are interested in finding out more about this program. Overview, Sodium-Sulfur Battery, Battery Performance and Testing, Battery Analysis, Flow Batteries, Lithium Rechargeable Batteries, Alkaline Batteries, Metal-Air Batteries, Fuel Cells and Electrochemical Processes.

33373 **(CONF-840804—23) Thermal management of a lithium/iron-sulfide battery.** Shimotake, H.; Chilenskas, A.A.; Malecha, R.F.; Yao, N.P. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013438.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

A thermal management design analysis has been completed for a Li-Al/FeS battery. High efficiency thermal insulation is used to insulate the battery case which keeps heat loss to an acceptable level while maintaining the battery at its proper operating temperature of the battery during startup, normal operation, and standby duty. Computer assisted thermal modeling supported by experimental data show that the temperature uniformity of the cells in a 162-cell battery can be kept within 16C under anticipated operating conditions.

33374 **(CONF-840804—24) Effects of standtime on the available capacity of lead-acid and nickel/iron electric vehicle batteries.** DeLuca, W.H.; Tummillo, A.F.; Biwer, R.L.; Yao, N.P. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013452.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

In electric vehicle (EV) applications, the battery load typically contains interruptions of various time durations. These standtimes affect the battery's available capacity and must be understood in order to predict and optimize vehicle operation. Laboratory tests were conducted to measure the impact of various standtimes (0-4 h) at different depth-of-discharge (DOD) and state-of-charge (SOC) levels on the capacity retention of both improved lead-acid and nickel/iron (Ni/Fe) EV batteries. The results showed that the Ni/Fe system exhibits a self-discharge capacity loss immediately after charging that increases with both standtime and SOC. Fortunately, the self-discharge rate decreases rapidly with standtime and discharging. Standtimes after charging also decrease the available capacity of the lead-acid system due to reduced battery temperatures. However, standtimes at DOD levels > 50% provide an increase in battery capacity by allowing for the relaxation of electrolyte concentration gradients. This paper describes the test procedures used, presents the test data, and discusses the results.

33375 **(CONF-840853—1) Chemical stability of beta-alumina.** Smaga, J.A. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84009635.

From International Society of Electrochemistry; Berkeley, CA, USA (5 Aug 1984).

Beta-alumina tubes can fracture under conditions which arise during the operation of Na/S cells. Several models, based on sodium ion focusing at the crack tip, have been proposed to explain the failure mode and are discussed in recent papers. In this study, two beta-alumina compositions that are used in developmental cells were immersed in molten sodium to differentiate the chemical effects of electrolyte degradation from the electrochemical ones. Tests were also conducted in sodium polysulfide melts because electrolyte deterioration on the sulfur side has also been reported.

33376 **(CONF-840853—2) Electrochemical performance of porous nickel sulfide electrodes.** Redey, L.; Vissers, D.R. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84009586.

From International Society of Electrochemistry; Berkeley, CA, USA (5 Aug 1984).

Portions are illegible in microfiche products.

The objective of this study has been to characterize the electrochemical performance (utilization and voltage loss) of porous nickel sulfide electrodes in molten salt electrolytes.

33377 **(CONF-840853—4) Characterization of voltage losses during high-intensity current pulses in reactive, porous electrodes of molten salt cells.** Redey, L. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012112.

From International Society of Electrochemistry; Berkeley, CA, USA (5 Aug 1984).

Portions are illegible in microfiche products.

A technique for the rapid characterization of the power-related properties of porous electrodes of molten salt cells has been developed. In this method, the electrode properties were investigated under one-dimensional current-distribution conditions in small test cells of 0.3 to 1.5 Ah capacity. The electrode potential was measured against a Ni/Ni_3S_2 or Li-Al reference electrode located so that the IR-voltage drop was eliminated. At different states of charge, galvanostatic discharge or charge current pulses of different intensity and duration were applied to the electrode by high-precision power sources. The state of charge for the electrode was determined from the quantity of the coulombs passed in galvanostatic cycling and is indicated in this paper by the numeric value of x in the generic formula of the active material (e.g., x in FeS/sub x/). Electrode materials iron sulfide, nickel sulfide, Li-Al and Li-Si alloys in LiCl-KCl and LiF-LiCl-LiBr molten salt electrolytes were investigated.

33378 **(CONF-840853—5) Recent results from the National Battery Test Laboratory.** Hornstra, F.; Yao, N.P. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012110.

From International Society of Electrochemistry; Berkeley, CA, USA (5 Aug 1984).

Portions are illegible in microfiche products.

The National Battery Test Laboratory (NBTL) is an Argonne National Laboratory facility for testing, evaluating, and studying advanced electric storage batteries. The facility tests batteries developed under Department of Energy programs and from private industry. These include batteries intended for future electric vehicle (EV) propulsion, electric utility load leveling, and solar energy storage. This paper will focus on the testing of EV batteries as this application is the most demanding and requires the most versatile test program. The NBTL was established in 1977 and became operational in 1978. It is computer automated and operates around-the-clock. The facility has room for the simultaneous testing of about 76 batteries, each independently operated, under various environmental conditions and over a wide range of voltages and currents. The NBTL has four major components as follows: (1) The control room and main test area where ambient and elevated temperature testing are conducted. (2) The environmental annex where low temperature chambers and a Zn/Cl test facility (with halogen scrubber) exist. (3) The Battery Components Technology (BCT) Laboratory where special instrumentation and software are installed to allow systematic parametric variation and optimization and other refined studies. (4) The recently added high temperature test area where Li/S and Na/S cells are under evaluation.

33379 **(CONF-840853—6) Inelastic neutron scattering study of β-PbO_2: recent results.** Varma, R.; Eckert, J.; Maroni, V.A.; Giordano, C.; Goldstone, J.A.; Cehelnik, T. (Argonne National Lab., IL (USA); Los Alamos National Lab., NM (USA)). 1984. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012107.

From International Society of Electrochemistry; Berkeley, CA, USA (5 Aug 1984).

Electrochemical activity of lead dioxide electrode in the lead-acid battery system may be related to the incorporation of hydrogen defect in the material. The coherent and incoherent neutron-scattering cross sections of Pb, O, and H atoms are sufficiently different from each other to assure meaningful results from neutron scattering studies. A preliminary analysis of experimental results of inelastic incoherent neutron scattering (IINS) study on β-PbO_2 (Space Group P_{42} mnm) from cycled lead-acid battery plates, in addition to yielding the vibrational spectrum representative of motions of Pb and O atoms in the crystal lattice, provided for the first time the evidence for the presence of tightly bound protons in the solid phase. We report in this paper on the observed vibrational modes for β-PbO_2 material prepared chemically and obtained from cycled battery plates.

33380 **(LBL—17742) Technology Base Research Project for electrochemical energy storage. Annual report for 1983.** Kinoshita, K. (ed.). (Lawrence Berkeley Lab., CA (USA)). 18 May 1984. Contract AC03-76SF00098. 131p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013877.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The Lawrence Berkeley Laboratory (LBL) is the Lead Center for management of the Technology Base Research (TBR) Project, which is supported by DOE's Office of Energy Systems Research, Energy Storage Division. The purpose of this project is to provide the research base which supports DOE efforts to develop electrochemical technology for electric vehicle and stationary energy storage applications. The general objective of the TBR project is to help provide advanced electrochemical systems that can satisfy stringent performance and economic requirements for electric vehicle and stationary energy storage applications. The specific goal of the project is to identify the most promising electrochemical technologies and transfer them to industry and/or another DOE program for further development and scale-up. General problem areas addressed by the project include identification of new electrochemical couples for advanced batteries, determination of technical feasibility of the new couples, improvements in battery components and materials, establishment of engineering principles applicable to electrochemical energy storage and conversion, and the assessment of fuel cell technology for transportation applications. Major emphasis is given to applied research which will lead to superior performance and lower life-cycle costs. The TBR project is divided into four major project elements: Electrochemical Systems Research, Supporting Research, Electrochemical Processes, and Fuel Cells for Vehicles. This report summarizes the research, financial, and management activities relevant to the TBR project in CY 1983. Highlights of each project element are summarized according to the appropriate battery system or electrochemical research area.

33381 **(LBL—17776) General energy balance for battery systems.** Bernardi, D.; Pawlikowski, E.; Newman, J. (Lawrence Berkeley Lab., CA (USA)). Apr 1984. Contract AC03-76SF00098. 43p. (CONF-841058—2). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013235.

From Fall meeting of the Electrochemical Society; New Orleans, LA, US (7 Oct 1984).

Portions are illegible in microfiche products.

A general energy balance for battery systems has been developed. This equation is useful for estimating cell thermal characteristics. Reliable predictions of cell temperature and heat generation rate are required for the design and thermal management of battery systems. The temperature of a cell changes as a result of electrochemical reactions, phase changes, mixing effects, and joule heating. The equation developed incorporates these effects in a complete and general manner. Simplifications and special cases are

discussed. The results of applying the energy balance to a mathematical model of the LiAl/FeS cell discharged through two different reaction mechanisms are given as examples. The examples illustrate how the energy equation may be applied to a specific system to examine the relative contributions corresponding to the terms in the equation. The examples show that the processes involved in cell heat generation may be complex and that the application of a sufficiently general energy equation is advantageous.

33382 **(PB—84-187723) Evaluation of a 96v globe ev 1000 battery pact at temperature extremes. Final report.** Nowak, D. (Alabama Univ., Huntsville (USA). Kenneth E. Johnson Environmental and Energy Center). Aug 1983. 33p. (UAH—376). NTIS, PC A03/MF A01.

Sponsored in part by Aerospace Corp., Washington, DC.

Tests with a 96V GLOBE EV 1000 battery were conducted to measure the effects of temperature extremes on the performance of EV batteries. The test objectives were to assess the nature and extent of problems encountered at various operating temperatures and to provide the engineering data base for the elimination of the problems.

33383 **(PB—84-187731) Evaluation of an 96v ALCO 2200 battery pack at temperature extremes. Final report.** Nowak, D. (Alabama Univ., Huntsville (USA). Kenneth E. Johnson Environmental and Energy Center). Jun 1983. 34p. (UAH—368). NTIS, PC A03/MF A01.

Sponsored in part by Aerospace Corp., Washington, DC.

Tests with a 96 V ALCO 2200 battery were conducted to measure the effects of temperature extremes on the performance of EV batteries. The test objectives were to assess the nature and extent of problems encountered at various operating temperatures and to provide the engineering data base for the elimination of the problem.

33384 **(PB—84-187749) Evaluation of an 96v Exide XPV23-3 battery pack at temperature extremes. Final report.** Nowak, D. (Alabama Univ., Huntsville (USA). Kenneth E. Johnson Environmental and Energy Center). Apr 1983. 59p. (UAH—367). NTIS, PC A04/MF A01.

Sponsored in part by Aerospace Corp., Washington, DC.

Tests with a 96V Exide XPV23-3 battery were conducted to measure the effects of temperature extremes on the performance of EV batteries. The test objectives were to assess the nature and extent of problems encountered at various operating temperatures and to provide the engineering data base for the elimination of the problems.

33385 **(SAND—83-2273C) Multicell Li/$SOCl_2$ reserve battery.** Baldwin, A.R.; Garoutte, K.F. (Sandia National Labs., Albuquerque, NM (USA); Honeywell, Inc., Horsham, PA (USA). Power Sources Center). 1984. Contract AC04-76DP00789. 11p. (CONF-8406119—2). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012812.

From 31. power sources symposium; Cherry Hills, NY, USA (12 Jun 1984).

Recent development work on reserve lithium thionyl chloride (RLTC) batteries at SNLA and Honeywell has included safety and performance evaluations. The RLTC battery is being considered for applications that have traditionally been fulfilled by state-of-the-art thermal batteries and reserve silver oxide zinc electrochemical systems. These applications typically demand a reserve battery having a rapid voltage rise, high reliability, operational safety and useful active lifetime ranging from minutes to hours. The RLTC work reported here was directed toward a power battery capable of meeting or exceeding the design requirements. Performance and safety test data indicate that the RLTC battery may be better suited than thermal batteries for some long-life applications. Table II presents a comparison between a Li(Si)/FeS_2 thermal battery and an RLTC battery, both of which were designed to fulfill the requirements.

33386 **(SAND—84-0982C) Review of flow battery testing at Sandia.** Butler, P.C.; Miller, D.W.; Robinson, C.E.; Rodriguez, G.P. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 13p. (CONF-840804—6). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011186.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

Sandia National Laboratories is evaluating prototype zinc/bromine, Redox, and zinc/ferricyanide flowing electrolyte batteries and cells. This paper will update previous reports of test results of two Exxon zinc/bromine batteries and one NASA Redox iron/chromium battery. Two 60-sq. cm. zinc/ferricyanide cells from Lockheed Missiles and Space Co. are also being evaluated. Performance, life, and operating data will be described for these batteries and cells.

33387 **(SAND—84-7108) Study of bipolar batteries.** Clifford, J.E. (Battelle Columbus Labs., OH (USA)). Jun 1984. Contract AC04-76DP00789. 53p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013193.

Battelle determined the status of development of bipolar batteries having an aqueous electrolyte. Included in the study were lead-acid, nickel-cadmium, nickel-zinc, nickel-iron, and nickel-hydrogen batteries. A review of the technical and patent literature is presented along with a bibliography covering the past 15 years. Literature data are supplemented by a survey of organizations. The principal interest has been in bipolar lead-acid batteries and more recently in bipolar nickel-hydrogen batteries for space applications. There have been only limited efforts to develop bipolar batteries for electric vehicle applications. Recommendations are made for additional studies.

From Electrochemical society meeting; San Francisco, CA, USA (12 May 1974).

An investigation of the physical and chemical properties of FeS_2 and $FeS_2 + Li_2S$ mixtures as the active materials for secondary cells with molten lithium as the negative electrode active material is reported. The mechanism of self-discharge, performance characteristics and the effects of current collection techniques were studied in specially designed cells and in cells composed of parallel plate electrodes with areas of from 5 to 20 cm^2.

33418 Semi-solid mixed cathodes for lithium/chalcogen cells. Walsh, W.J.; Cairns, E.J.; Arntzen, J.D. (Argonne National Lab., IL). *Journal of the Electrochemical Society;* **120**: No. 3, 111C(Mar 1973). (CONF-7305140—).

From Electrochemical Society meeting; Chicago, IL, USA (13 May 1973).

An electronically conductive semi-solid cathode has been developed for use in lithium/chalcogen cells containing a molten salt electrolyte. This cathode consists of a mixture of liquid sulfur, additive, and carbon black, and has been shown to be immobilized and contained within the cathode compartment. This cathode system was shown to retain its physical integrity and its electronic conductivity after repeated cycling and has yielded 1.0 A-HR/Cm^3 of cathode volume.

33419 Self regenerating storage battery. (to USAEC). British Patent 1,200,433. 29 Jul 1970. Priority date 27 Mar 1968, United States of America (USA), vp.

PAT-APPL-716,436.

The battery, has a cathode arranged in an acid solution containing plutonium ions in nitric or hydrochloric acid in concentration of 1 mole per litre in a first container to provide tetravalent plutonium cations for reduction at the cathode to trivalent cations. An anode is arranged in a second container in a similar solution of concentration 0.2 mole per litre to provide trivalent plutonium cations for oxidation at the anode to tetravalent plutonium cations. Means for ion migration between the first and second solutions is provided.

33420 Lithium-selenium secondary cells with paste electrolytes. Gay, E.C.; Trevorro, L.E.; Kyle, M.L.; Kolba, V.M.; Cairns, E.J. (Argonne National Lab., IL). pp 150-153 of Electrochemical Society fall meeting, extended abstracts. New York, NY; Electrochemical Society (1970).

From Electrochemical Society fall meeting; Atlantic City, NJ, USA (4 Oct 1970).

33421 High-rate lithium/selenium secondary cell with a fused-salt electrolyte. Shimotake, H.; Cairns, E.J. (Argonne National Lab., IL). pp 32 of 133rd meeting of the Electrochemical Society, abstracts. New York, NY; Electrochemical Society (1968). (CONF-680579—).

From 133. meeting of the Electrochemical Society; Boston, MA, USA (5 May 1968).

A secondary cell with a lithium anode, a fused LiF-LiCl-LiI electrolyte (MP 340.9°C), and a selenium cathode has been investigated at 350°-400°C, using several types of cathode current collectors. The electrode areas were 3.9 and 10 cm^2; cell capacities varied from 4 to 8.9 amp-hr, selenium being present is excess. The current density-voltage characteristics were linear with an open-curcuit voltage of 2.3-2.4v and short-circuit current densities of 11-13 amp/cm^2, corresponding to a maximum power density of 6.3-7.8 watts/cm^2. Complete recharge was achieved in less than 15 min.

33422 Performance characteristics of a lithium-tellurium cell. Shimotake, H.; Rogers, G.L.; Cairns, E.J. (Argonne National Lab., IL). pp 42-45 of Electrochemical Society 1967 fall meeting. New York, NY; Electrochemical Society Inc. (1967). (CONF-671099—).

From Electrochemical Society fall meeting; Chicago, IL, USA (15 Oct 1967).

Recently there has been a significant increase in the effort devoted to high power density and high energy density secondary cells. Examples of cells which possess both of these characteristics are the lithium-chlorine cell, the sodium-sulfur cell, and the sodium-bismuth cell. This latter cell being an example of bimetallic cells with fused-salt electrolytes, demonstrated the high current-density capabilities of bimetallic cells; however, improvements in both power density and current density were deemed necessary before bimetallic cells could be considered fully competitive.

33423 Self-discharge in alkali metal-containing bimetallic cells. Hesson, J.C.; Foster, M.S.; Shimotake, H. (Argonne National Lab., IL). pp 46-47 of Electrochemical Society 1967 fall meeting. New York, NY; Electrochemical Society Inc. (1967). (CONF-671099—).

The energy situation of Burma is reviewed on the basis of some relevant data. Its energy policy is commented on, and developments in electric power generation are described as well as the trends observed for the various energy sources.

2901 Energy Analysis And Modeling

REFER ALSO TO CITATION(S) 32636, 33460, 33582

33426 (DOE/RA/33008—T1) Analysis of the potential for gas demand strategies. Report on evaluation of existing gas models and plan for creating a model appropriate to the needs of DOE/RA. (Lewin and Associates, Inc., Washington, DC (USA)). 23 Dec 1980. Contract AC01-79RA33008. 109p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84012713.

Portions are illegible in microfiche products.

The purpose of this study is to review the state-of-the-art in gas demand modeling. The focus of the study is on the validity, policy-relevance, and flexibility of models, particularly as they relate to the issue of displacing liquid fuel imports with natural gas. The selected models for review were based on appropriateness to the reduction of liquid imports; however, a secondary goal of the study is the illustration of alternative methodology and applications. The paper begins with an expanded statement of the study focus, to suggest the range of policy questions which may benefit from gas demand modeling. Following this, eleven energy-related models are briefly reviewed by laying out each model's salient features such as: assumptions, data and algorithm; the advantages and disadvantages of each model are discussed. Information from the individual model reviews is drawn together in a final section which sets forth a set of specifications for an ideal gas demand model which would be most useful to DOE/RA in formulating policy with respect to gas demand. 16 references.

Utility companies are in the predicament of having to make forecasts, and draw up plans, whose horizons lie increasingly further in the future, and they must do so in an increasingly fluid and volatile socio-economic environment. Several lines of inquiry were pursued, all intended to lead to mathematical models for these processes. The models were to be well founded conceptually, technically sound, and compatible with the uncertainties that are inherent in any description of behavioral phenomena. Three main topics are treated. One is the representation of the characteristics of the members of an organization, to the extent to which characteristics seem pertinent to the processes of interest. The second is the appropriate management of the processes of change by an organization. The third deals with the competitive striving towards an economic equilibrium among the members of a society in the large, on the theory that this process might be modeled in a way which is similar to the one for the intra-organizational ones.

33428 (ESC-WR—83-17) Calculations with the energy model SELPE: investments in four energy scenarios. van Oostvoorn, F. (Stichting Energieonderzoek Centrum Nederland, Petten. Energie Studie Centrum). Nov 1983. 20p. (In Dutch). ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

Calculations are made on investments in four energy scenarios accepted for basic studies in the context of the 'National Debate on Energy Policy' (MDE) by the Energy Study Centre (ESC), a department of the Netherlands Energy Research Foundation (ECN) at Petten. These calculations were made with their energy model SELPE (Static ESC Linear Programming Energy Model). Following scenarios are discussed: the Reference Scenario, Scenario for Industrial Recovery, Scenario for Redistribution of Labor, and the Scenario of the Centre for Energy Conservation. Before the representation of the results and the analyses are made, the different scenarios are described briefly and compared. Investments for the electricity generation will be important. Investments for the protection of the environment are not taken into account, except those for the restriction of sulfur dioxide emission. The total investments of the four scenarios do not differ very much, but the distribution does considerably.

33429 (ORNL—6042) Energy Division annual progress report for period ending September 30, 1983. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 192p. NTIS, PC A09/MF A01; GPO Dep. Order Number DE84013482.

This report covers work done during FY 1983 by the staff of the Energy Division and its subcontractors and by colleagues in other Oak Ridge National Laboratory divisions working on Energy Division projects. The work can be divided into four areas: (1) analysis and assessment, (2) models and data systems, (3) research to improve the efficiency of energy use and to improve electric power transmission and distribution, and (4) research utilization. Support came principally from the US Department of Energy (DOE), the US Nuclear Regulatory Commission, and the US Department of Defense, but also from a number of other agencies and organizations. Analysis and assessment included work on (a) environmental issues, including those deriving from the preparation of environmental impact statements; (b) energy and resource analysis; and (c) emergency preparedness. The models and data systems area involved research on evaluating and developing energy, environment, and engineering simulation models and on devising large data management systems, evaluating user data requirements, and compiling data bases. Research on improving the efficiency of energy use was focused primarily on the buildings and electricity sectors. A major effort on heat pump technology, which includes both heat-activated and electrically driven systems, continues. An important aspect of all the work was research utilization. Since the Energy Division is doing applied research, results are, by definition, intended to solve problems or answer questions of DOE and other sponsors. However, there are other users, and research utilization activities include technology transfer, commercialization efforts, outreach to state and regional organizations, and, of course, information dissemination.

33430 (PB—84-165547) Rural energy balance of Colombia and its socioeconomic context 1981. Torres, J.E. (Universidad de Los Andes, Bogota (Colombia). Centro de Estudios sobre Desarrollo Economico). Nov 1982. 534p. (In Spanish). NTIS, PC A23/MF A01.

This report discusses the methodology used and results obtained from a two-year study of the energy behavior of family and production units in rural Colombia. It gives a brief outline of a theoretical discussion of methodology and then an analysis of the use of energy in a sociocultural, economic, and technological context in rural areas. The methodology used to select the sample of family and productive units is given as is the criteria in the design of the questionnaire. Then the results are given for the study of 2,018 homes, extrapolated for six different energy regions. Energy consumption for agricultural and agroindustrial activities is given for eleven cultivations, including coffee. Rural industry is scarce,

mostly the production of mud bricks and tiles. The study confirms the importance of petroleum derivatives to agriculture in Colombia. All the above information is recapitulated in a countrywide conclusion.

33431 **(PB—84-166529) UK (United Kingdom) implementation of MEDEE-3. Final report.** Thomas, S. (Commission of the European Communities, Luxembourg). 1983. 76p. (EUR—8294-EN). NTIS, PC E05/MF E05.

MEDEE-3 was developed as a model to permit long-term energy demands within the EEC to be estimated. Its application to the UK economy is discussed. The data base for the model was compiled from data for 1975 and a detailed case study providing forecasts for 1980-2000 was completed. The data for 1980 and the predictions for 1990 and 2000 were compared with Department of Energy predictions and figures for 1980. These results show general agreement although some discrepancies arise. Whilst some of the model details require adjustment and problems have been identified with the input data, most of the discrepancies arise because of changed assumptions.

33432 **Disaggregating input-output models.** Wolsky, A.M. (Argonne National Lab., IL). *Review of Economics and Statistics;* **66**: No. 2, 283-291(May 1984). Contract W-31-109-ENG-38.

A general solution is given to the problem: with little computation, construct a more disaggregated input-output model from an available model, using information about some activities that were aggregated when the available model was built. The solution is exact and explicit. When only partial information is available, the exact solution guides its user to inexpensive and precise sensitivity analysis. Detailed consideration is accorded to the solution of the most frequently occurring problem: the disaggregation of one sector into two. 14 references.

33433 **(DOE/RA/50258—1) Systems economics for industry functional modeling. Second annual technical report.** Luenberger, D.; McEntire, P.; Duffie, D. (Systems Control Technology, Inc., Palo Alto, CA (USA)). Dec 1982. Contract AC01-80RA50258. 101p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84011443.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The three chapters of this report cover three distinct topics: dynamic markets, foundational issues in descriptor variable theory, and technological investment. The first of these, dynamic markets, represents a major effort in the synthesis of technological-economic modeling as discussed above. It is close in spirit to the models of optimal control theory that have been so successful in dynamic decision making, but it also captures the economic effects of markets. The second topic, foundational issues in descriptor variable theory, continues our basic research on descriptor variables that is fundamental to our models. The third topic, technological investment, represents a continuation of our basic work on the theory of investment within a firm. The pattern of research presented in this report is therefore consistent with our general research strategy. The first topic represents our best current work on the synthesis of technological and economic considerations, while the second two topics each represent further research on the individual components.

33434 **(DOE/RA/50258—2) Systems economics for industry functional modeling.** (Systems Control Technology, Inc., Palo Alto, CA (USA)). Aug 1983. Contract AC01-80RA50258. 170p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84013542.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report has contributed to the theoretical development of an approach to industry functional modeling that emphasizes the economics in technological planning, operation, and project selection. The body of this final report is organized into six chapters. Chapter 2, A Composite Investor Criterion for Capital Budgeting, and Chapter 4, Technological Investments, discuss methods for selecting technological projects from an economic standpoint. Chapter 3, Foundational Issues in Descriptor Variable Systems, extends and makes rigorous the theory in this important area. Chapters 5 and 6 present work in the area of dynamic markets; the first on Linear-Quadratic Dynamic Markets, the second on Control of Dynamic Market Systems. Finally, Chapter 7 discusses the application area of electric power brokerage systems and proposes methods to improve their operation.

33435 **(PB—84-163880) Transportation energy management: fuel futures.** (Cabot Consulting Group, Washington, DC (USA)). Feb 1983. 74p. NTIS, PC A04/MF A01.

Sponsored in part by Urban Mass Transportation Administration, Washington, DC.

The report is designed to provide guidance on the use of fuel futures trading to lock in the price of fuel against volatile changes. While this is a new and different measure for a transit operator to take, the use of fuel futures seems to represent a rational and potentially beneficial action for transit operators concerned with rapid changes in fuel price. These measures have applicability in contingency planning to reduce price problems or provide for obtaining necessary fuel supplies in an energy emergency. The report describes the futures market operation in detail and addresses the feasibility of futures market trading in a straight-forward question and answer format. A glossary of market trading terminology is also included.

33436 **(CONF-8210265—) Proceedings: environmental government affairs seminar.** (Air Pollution Control Directorate (Canada)). 1982. 519p. NTIS (US Sales Only), PC A22/MF A01. Order Number DE84901096.

From Air Pollution Control Association and Federation of Associations on the Canadian Environment conference on environmental concerns of the 80'; Ottawa, Canada (12 Oct 1982).

Portions are illegible in microfiche products.

Presentations and summaries of comments are provided. Topics addressed during the seminar include: federal-provincial-industry-public interface concerning environmental problems in the 1980's; environmental impact assessment; transboundary pollution; hazardous substances; motor vehicles; and water - a manageable resource of the 80's.

33437 **(DOE/EV/10396—T1) Colorado's Joint Review Process for major energy and mineral resource development projects.** (Colorado Dept. of Natural Resources, Denver (USA)). Dec 1980. Contract FG03-80EV10396. 166p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84013137.

Portions are illegible in microfiche products.

Colorado's Joint Review Process for Major Energy and Mineral Resource Development Projects (JRP) is an intergovernmental review process that coordinates government's review of major energy and mineral resource development projects. The JRP provides structure and certainty to an otherwise fragmented and unstable set of requirements, procedures, time frames, and interagency relationships. The JRP is a management system designed to coordinate regulatory and administrative reviews conducted by the three levels of government, thus expediting those review processes and improving the quality of project planning and review. This Manual provides a suggested comprehansive set of coordination procedures that should be used when conducting joint reviews of major energy or mineral resource development projects that are in early stages of project planning development. Although specific step-by-step coordination procedures are provided, nothing in this Manual should be considered mandatory or rigid. On the contrary, the Manual is a flexible guideline which can and should be modified or scaled-down to accommodate the unique characteristics of projects undergoing joint review.

33438 **(DOE/EV/10396—T3) Colorado Joint Review Process. Final technical report.** (Colorado Dept. of Natural Resources, Denver (USA)). Dec 1983. Contract FG03-80EV10396. 434p. NTIS, PC A19/MF A01; 1; GPO Dep. Order Number DE84013138.

Portions are illegible in microfiche products.

The Colorado Joint Review Process (CJRP) began operating in 1978 as an experiment in coordinated permitting for the Mount Emmons Molybdenum Mine and Mill proposed by AMAX, Inc. The CJRP has evolved from an administrative experiment to a statutorily authorized agency of Colorado State Government. This report is a compendium of materials describing how the CJRP has performed and how it might be enhanced over time. The materials contained in this volume have been organized into four primary sections. The first section includes materials which provide a general description of the CJRP. Articles, clippings, briefing memorandums, and the CJRP legislation provide a broad overview of what the CJRP is intended to accomplish and how it works. The second and third sections focus on how the CJRP has been received and how it might be improved. In these sections a variety of articles detailing the programs's strengths and weaknesses. The CJRP's applicability to other states is also addressed through the inclusion of several articles and papers. The final section is comprised of copies of the CJRP Projects' Updates. The updates provide a running commentary on each of the projects participating in the CJRP. Finally, a copy of the CJRP Manual has been included.

33439 **(FWS/OBS—84/08) Conducting a FERC environmental assessment: a case study and recommendations from the Terror Lake Project.** Olive, S.W.; Lamb, B.L. (Fish and Wildlife Service, Fort Collins, CO (USA). Western Energy and Land Use Team). Apr 1984. 68p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013134.

This paper is an account of the process that evolved during acquisition of the license to operate the Terror Lake hydroelectric power project under the auspices of the Federal Energy Regulatory Commission (FERC). The Commission is responsible for granting these licenses under the Federal Power Act (16 U.S.C. 792 et seq.). This act provides, in part, that FERC may condition a license to protect the public interest. The public interest in these cases has come to include both instream and terrestrial values. The Terror River is located on Kodiak Island in Alaska. The river is within the Kodiak National Wildlife Refuge; it supports excellent runs of several species of Pacific Salmon which are both commercially important and a prime source of nutrition for the Kodiak brown bear. The river is also a prime resource for generating electric power. One major concern in the negotiations was the impact of land disturbance and management practices on brown bear habitat - i.e., protection of the brown bear. Maintenance of the bears' habitat is the main purpose of the Kodiak National Wildlife Refuge. But, like many other projects, resolving the instream flow issue was of major importance in the issuance of the FERC license. This paper discusses the fish and wildlife questions, but concentrates on instream uses and how protection of these uses was decided. With this as a focus, the paper explains the FERC process, gives a history of the Terror Lake Project, and, ultimately, makes recommendations for improved management of controversies within the context of the FERC licensing procedures. 65 references.

33440 **(PB—84-158013) Human demographic impacts on fish and wildlife resources from energy development in rural western areas.** Thomas, M.G. (Midwest Research Inst., Kansas City, MO (USA)). Sep 1983. 375p. NTIS, PC A16/MF A01.

This workbook provides a mechanism for analysis of human demographic impacts on fish and wildlife due to large-scale energy developments in Western States. It focuses on impacts related to land use conversions and the accompanying reduction in quantity or quality of habitat and on impacts related to population growth and their demands or impacts on fish and wildlife resources.

33441 **(SOU—1983:20) Better environmental protection II. Final report from the Environmental protection commission.** (Jordbruksdepartementet, Stockholm (Sweden)). 1983. 230p. (In Swedish). NTIS (US Sales Only), PC A11/MF A01. Order Number DE84751019.

The purpose of the Environmental Protection Commission was, in wiew of the experience gained from the application of the Environmental Protection Act to consider the legislative changes required to improve societs possibilities for intervening against and controlling environmentally hazardous activity. In its part report, better Environmental Protection I (Swedish Government Official Reports, SOU 1978:80) the Commission put forward its proposals on the system for pre-examination, supervision and sanction as well as right of appeal. In its part report, pollution of soil and ground water (Ministry of agriculture series, DsJo 1983:1), in additon to matters related to soil and ground water, the Commission dealt with the question of boarderline between areas of application of ML and water legislation and submitted proposals in these respects. In this final report, the Commission puts forward proposals in the following matters: Restoration and clean up of areas damaged as a result of environmentally hazardous activity; Environmental protection examination of public roads and streets; Environmental protection examination of airports; Noise from movable property; The standing of fishing interests in connection with examination in accordance with environmental protection legislation; The relationship between international agreements in the area of external environmental protection. In addition, certain other matters are reported that arose during the work of the Commission. Among these, special mention may be made of the matter of the legal treatment of environmental disturbances due to electrical installations.

33442 **(DOE/EV/10396—T2) Colorado permit directory for energy and mineral resource development.** (Colorado Dept. of Natural Resources, Denver (USA)). Dec 1983. Contract FG03-80EV10396. 432p. NTIS, PC A19/MF A01; GPO Dep. Order Number DE84013136.

This directory identifies the federal, state and local permits that may be required to explore, extract and process energy and mineral resources in Colorado as well as to develop major recreational sites in the state. All applicable federal, state and local permits are addressed. A review of county government environmental and land use enabling legislation is also provided. (ACR)

33443 **(PB—83-940806-2) USSR report: energy, No. 153, 12 July 1983-No. 169, 20 December 1983, JPRS tables of contents.** (Joint Publications Research Service, Arlington, VA (USA)). 1983. 45p. NTIS, PC A03.

Trans. of Russian Reports, 1983.

The report contains tables of contents of collections of translations of Russian articles on different sources of energy.

33444 **Energy and water development appropriations for 1985. Part 7. Testimony of members of congress and other interested individuals and organizations. Hearings before the Committee on Appropriations, House of Representatives, Ninety-Eighth Congress, Second Session.** Washington, DC; Government Printing Office (1984). 1446p.

Part 7 of the hearing record covers the testimony of members of congress and other individuals and organizations wishing to comment on water and energy-related projects. The witnesses commented on the merits of projects in their states and districts. Of major concern were financing arrangements and strategies for cost sharing between the federal government and the private sector or state and local government. Witnesses spoke of the needs for water transport, irrigation, erosion and flood control, and other areas of concern.

33445 (CEA-N—2364) 1982. Progress report (no.19). (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). 1983. 251p. (In French). NTIS (US Sales Only), PC A12/MF A01. Order Number DE84751563.

Portions are illegible in microfiche products.

The research programs in solid state physics (physical metallurgy, semiconductors, magnetism, electronic structure), nuclear physics (heavy ion reactions, fission), chemistry and organic physical chemistry, and biology are described. Short scientific communications are reported and a list of the papers published by the department in 1982 is given.

33446 (GSI—82-15) GSI annual report 1981/82. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Dec 1982. 158p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84751439.

This annual report contains short surveys about the scientific work performed by the named society, which concerns exotic nuclei, improvements of the UNILAC, and acceleration studies for the heavy ion induced inertial fusion, together with descriptions of the single fields of work concerning nuclear physics and nuclear chemistry with heavy ions, atomic physics with heavy ions, applications of heavy ions in biology and technology, as well accelerator developments. Furthermore lists of the scientific reports of 1981 and 1982 are added.

33447 (WAOENG—82-40) Current energy research and development in Washington State, 1982. (Washington State Energy Office, Olympia (USA)). Dec 1982. 103p. Washington State Energy Office, 400 E. Union, Olympia, WA 98504. Order Number TI84901172.

This directory is intended to acquaint researchers, policy makers, and citizens with recent activities in energy research, development, and demonstration projects. The information was collected by survey forms as printed in the WSEO newsletter, Volume 5, No. 4, June 1982; as sent to universities, utilities, research organizations, and contractors that did not send in the newsletter survey form; by computer search on the US Department of Energy's RECON data base in the Research-In-Progress file; by review throughout the year of directories, reports, newsletters, and newspapers for Washington projects; by follow-up telephone calls were made, as time permitted, to update the third edition; and with the inventory of Washington State Energy Office contract files.

33448 Management of Department of Energy programs and energy security. Hearing before the Subcommittee on Energy, Nuclear Proliferation, and Government Processes, United States Senate, Ninety-Eighth Congress, Second Session, January 24, 1984. Washington, DC; Government Printing Office (1984). 65p.

Energy Secretary Donald Paul Hodel was the principal witness at a hearing which reviewed the status of US energy security. Areas of progress included reaching six-month level of supply in the strategic petroleum reserve (SPR), a reduction in the level of dependency on imported oil, and an improved climate for energy conservation and technology investments. Hodel reviewed the current energy status, emphasizing the reduced vulnerability. Additional material submitted by Hodel for the record follows his testimony.

2906 Nuclear Energy

REFER ALSO TO CITATION(S) 32744, 33341, 34175

33449 (CNEN-NE—1.12) Qualification of organizations for independent technical supervision. (Comissao Nacional de Energia Nuclear de Brasil, Rio de Janeiro). Apr 1981. 7p. (In Portuguese). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84701907.

The requirements are established on trial for the qualification of an organization as an independent technical supervision organization in nuclear facilities, in activities related with quality assurance programs.

33450 (INIS-mf—8368) Energy and competition. Voices from industry. (Bundesverband der Deutschen Industrie e.V., Koeln (Germany, F.R.)). May 1982. 265p. (In German). NTIS (US Sales Only), PC A12/MF A01. Order Number DE84780317.

The members of the Enquete Commission "Future Energy Policy" of the German Bundestag are introduced as well as the list of participants from industry and other organizations in the public heaving on 18 th December 1981. Then the catalogue of questions of the Enquete Commission is presented. The written answers of the 11 representatives of industry form the main part of the report. The minutes of the public hearing of the Enquete Commission 'Future Energy Policy' of the German Bundestag on Friday, 18th December 1981 on the topic of 'The Competitiveness of German economy in various energy supply structures' are presented. (UA).

33451 (INIS-mf—8905) Act of 18 March 1983 on Nuclear Third Party Liability (LRCN). (French Government, Paris). 18 Mar 1983. 12p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84780322.

This new Act on nuclear third party liability maintains the two essential principles established by the law in force, namely those of causation and the channelling of liability on to the operator of a nuclear installation. On the other hand, the Act waives the principle of third party liability limited in amount and provides that the person liable must commit himself for an unlimited amount. Such liability is covered as follows: by private insurance up to 300 million francs; by the Confederation up to one thousand million francs over and above the amount covered by private insurance; by all the assets of the person liable. (NEA).

33452 (INIS-mf—8911) Decree No 82-864 of 4 October 1982 publishing the exchange of letters between France and Belgium dated 10 May 1982 concerning exchange of information on nuclear safety. (French Government, Paris). 10 Oct 1982. 2p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84780319.

Published in the French Official Gazette No. 237.

This Agreement provides, for purposes of nuclear safety, that France and Belgium will exchange information on their respective nuclear power plants and in particular, the Ardennes reactor (Chooz). (NEA).

33453 (INIS-mf—8913) Energy Act 1983 (Commencement No.1) Order 1983. (British Government, London). 23 May 1983. 4p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84780323.

This Order brings into force on 1 June 1983 the provisions of the Energy Act 1983 relating to electricity generation and supply. The Order also brings into force on 1 September 1983 the provisions of the Act relating to the Electricity Consumers' Council and to nuclear installations. (NEA).

33454 (ORAU/IEA—84-4(M)) Options for the assurance of nuclear fuel supply. Spiewak, I. (Oak Ridge Associated Universities, Inc., TN (USA)). May 1984. Contract AC05-76OR00033. 21p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012674.

Recent trends in the noncommunist countries have included a decrease in projected nuclear power production and an increase in uranium resources. As a result, any serious shortfall in low-cost uranium supply has been averted until after 2025 at the earliest. The need for the breeder reactor has been deferred, and other options for improving uranium utilization efficiency may become important. These options include exploitation of low-grade uranium resources, stripping of uranium from enrichment plant tailings, improved design of light water reactors, and recycle of fuel in thermal reactors. Utimately, breeders will be needed as part of an inexhaustible energy option.

33455 **(ORNL—5941) Protective actions as a factor in power reactor siting.** Gant, K.S.; Schweitzer, M. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 81p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013577.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report examines the relationship between a power reactor site and the ease of implementing protective actions (emergency measures a serious accident). Limiting populating density around a reactor lowers the number of people at risk but cannot assure that all protective actions are possible for those who reside near the reactor. While some protective measures can always be taken (i.e., expedient respiratory protection, sheltering) the ability to evacuate the area or find adequate shelter may depend on the characteristics of the area near the reactor site. Generic siting restrictions designed to identify and eliminate these site-specific constraints would be difficult to formulate. The authors suggest identifying possible impediments to protective actions at a proposed reactor site and addressing these problems in the emergency plans. 66 references, 6 figures, 8 tables.

33456 **(PB—84-183953) Nuclear power in an age of uncertainty.** (Office of Technology Assessment (U.S. Congress), Washington, DC). Feb 1984. 303p. (OTA-E—216). NTIS, PC A14/MF A01.

This report assesses the future of nuclear power in the U.S. and how the technology and institutions might be changed to reduce the problems now besetting the nuclear option. The future of nuclear power poses a complex dilemma to policymakers. It has advantages that may prove crucial to the nation's energy system in the coming decades. OTA examined questions of demand growth, costs, regulation and public acceptance to evaluate how these factors affect nuclear power's future. Research directions which would improve conventional light water reactor technology and opportunities to develop other types of reactor concepts that might enhance safe and reliable operation are reviewed. The crucial role of utility management in constructing and operating nuclear powerplants is examined at length. The controversy about nuclear safety regulations is also analyzed and is presented with a review of current proposals for regulatory reform. The study discusses policy approaches that could assist a revival of nuclear options should that be a choice of Congress.

This booklet provides the reader with historical energy information and projections of the nation's energy future. It is a synopsis of two major reports produced by the Energy Information Administration (EIA), the Annual Energy Review 1983 and the Annual Energy Outlook 1983. For greater detail and explanation, the reader should consult these parent documents, which are centerpieces of the EIA's comprehensive energy data and analysis program. This year the booklet includes a matrix on the inside front cover that provides quick reference to energy subjects. We hope this booklet provides the reader with important highlights in a convenient and useful form. 44 tables.

33460 **(EKONO—164) World's energy future.** Hultin, S.O.; Ruttley, E. (Finnish Energy Economy Association, Helsinki). 1982. 24p. (CONF-8206248—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751038.

From 3. Latin-American oil show; Caracas, Venezuela (29 Jun 1982).

The report is a review of world's energy support including a short inventory of world's energy sources and energy needs.

33461 **(EPRI-EA—3507-Vol.1) Industrial process models of electricity demand. Volume 1. Summary report. Final report.** Pierce, B.L. (Brookhaven National Lab., Upton, NY (USA)). May 1984. Contract AC02-76CH00016. 32p. NTIS, PC A03/MF A01 - EPRI; GPO Dep. Order Number DE84012078.

This executive summary report describes the results of a research project on the future electricity demands of three US industries: aluminum, iron and steel, and paper. For each industry a base case scenario is developed, and then compared with different scenarios of demand for its end-use product, electricity and energy prices, and levels of investment in new energy-efficient scenarios. Linear programming models of each industry form the methodological basis for the project, and each industry is modeled in detail for the period 1980 to 2000.

33462 **(EPRI-EA—3507-Vol.2) Industrial process models of electricity demand. Volume 2. The pulp and paper industry. Final report.** Pierce, B.L.; Pilati, D.A.; Chang, J.; Sparrow, F.T. (Brookhaven National Lab., Upton, NY (USA)). May 1984. Contract AC02-76CH00016. 127p. NTIS, PC A07/MF A01 - EPRI; GPO Dep. Order Number DE84012080.

The National Center for Analysis of Energy Systems at Brookhaven National Laboratory has developed a process model of the US pulp and paper industry. The model is based on data from economic and engineering analyses of the major manufacturing processes in pulp and papermaking and includes Standard Industrial Classifications 2611, 2621, 2631, and 2661. Energy conserving alternatives to conventional technologies are included. The pulp and paper model is a dynamic and regional process optimization model incorporating the Bureau of Census defined regions of the Northeast, North Central, South and West. It is dynamic in that it analyzes a 25-year time horizon. Given fuel prices and product demand projections, the model selects modes of operation and energy con-

sumption characteristics that minimize the cost of meeting the projected demands. With a projected average annual growth rate of 3.3% for paper products, model results show a decline in the energy intensity of paper production and an increase in the demand for electricity.

33463 (ORNL/TM—9065) Liberian macroeconomy and simulation of sectoral energy demand: 1981-2000. Hill, L.J. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 99p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013665.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The primary purpose of this report is to document the results of a research effort on end-use, sector energy demand in Liberia, West Africa over the 1981-2000 time horizon. The research was undertaken as one component of a much broader integrated energy assessment of Liberia. Other components of the assessment, however, focused on current energy supply and consumption together with future energy supply options for Liberia. This particular report is devoted exclusively to a discussion of Liberian energy demand. The methodology utilized to simulate Liberian sectoral energy demand over the period 1981-2000 involved the recursive interaction of a macroeconomic model and individual, econometrically-estimated sectoral demand equations. That is, given the projections for gross output in the Liberian economy from the macroeconomic model, sectoral energy demand was simulated. The individual energy demand equations were estimated on the basis of economic variables that are theorized to influence energy consumption in the respective sectors (e.g., price, output). The primary conclusion drawn from the analysis is that, besides being sensitive to changes in international economic activity, the demand for energy in Liberia over the 1981 to 2000 horizon is highly sensitive to internal production of its two primary exports: iron ore and rubber. More specifically, as characterized in the four scenarios, future growth in Liberian energy demand is contingent on the output of three companies: the Liberian American Swedish Mining Company, the Bong Mining Company, and the Firestone Rubber Company. Therefore, expansion of Liberia's energy supply capacity in the future should proceed cautiously. 16 references, 6 figures, 15 tables.

33464 (PB—84-163617) MEDEE-3: first results for Ireland and data collection. Final report. Killen, L. (Commission of the European Communities, Luxembourg). 1983. 112p. (EUR—8291-EN). NTIS, PC E06/MF E06.

Ireland's part in the energy research and development program of the E C, on the implementation of long-term energy demand models is described. After data collection for the MEDEE-3 model has been outlined, the data themselves are interpreted with regard to the socio-economic system, housing, and with regard to energy usage in the residential, tertiary, industrial, agricultural, and transport sectors. Lists of qualitative variables suitable for Irish case studies as well as relevant tabular functions are given. The last section of the report presents early results of the MEDEE-3 model for Ireland and forecasts of future energy demand.

33465 (PB—84-167337) Energy prospects for industry. Hartley, P.P.; Roberts, G.F.I.; Thomas, V.E.; Davies, D.; Crow, L.M. (Institute of Energy, London (UK)). 1983. 137p. NTIS, PC E10/MF E10.

Symposium held at University of Aston, Birmingham (England) on April 14, 1983.

Contents: Electricity today and tomorrow; Gas--supply prospects for the future; Petroleum based energy--the UK perspective; Future markets for coal; Flexibility--the key to Dunlop's energy strategy; Energy conservation in Alcan; Present and future energy patterns in Courtaulds PLC; New energy technology for the quarrying industry.

33466 (IFP—31-139) Economic aspects of the Chinese energy policy in the international background. Bourdeau, F. (Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison). May 1983. 227p. (In French). NTIS (US Sales Only), PC A11/MF A01. Order Number DE84750799.

Portions are illegible in microfiche products.

A first part sets out the situation of the Chinese energy industry in the following sectors: coal, hydrocarbons, electricity, and other energy sources such as nuclear energy and the renevable energy sources. A second part deals with the structure and the evolution of the Chinese energy balance: supply and demand, modeling of energy consumption, and forecasting for 1990-2000. The third part is about the foreign aspects of the Chinese energy policy means of an international energy policy, the aims of the Chinese energy policy and its influence in the world.

33467 (INIS-mf—8909) Decree 82-784 of 10 September 1982 publishing the Agreement for co-operation in the nuclear field between the Government of the French Republic and the Government of the United Arab Emirates, signed at Abou Dhabi on 6 March 1980. (French Government, Paris). 17 Sep 1982. 2p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84780318.

Published in the French Official Gazette No. 217.

This Agreement between France and the United Arab Emirates came into force on the day of its signature. It provides that France will provide the necessary technical assistance to the United Arab Emirates for the preparation of a nuclear energy development programme, covering in particular, electricity generation and water desalination. The Agreement covers a period of three years and is automatically renewable unless otherwise decided. (NEA).

33468 (INIS-mf—8912) Decree No 82-842 of 29 September 1982 in implementation of Act No 76-599 of 7 July 1976 concerning prevention and repression of marine pollution due to dumping by ships and aircraft and accidental marine pollution. (French Government, Paris). 3 Oct 1982. 6p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84780320.

Published in the French Official Gazette.

This detailed Decree provides for a system of permits for marine dumping of wastes and substances in determined areas in accordance with international conventions and the interests of national defense and telecommunications. (NEA).

33469 (CSIRO-DET-TR—2) Exploring some Australian energy alternatives using MARKAL. Musgrove, A.R.D.; Stocks, K.J.; Essam, P.; Le, D.; Hoetzl, J.V. (Commonwealth Scientific and Industrial Research Organization, Sutherland (Australia). Lucas Heights Research Labs.). 1983. 127p. Commonwealth Scientific and Industrial Research Organisation, Lucas Heights Research Labs., Sutherland, Australia.

MARKAL is a linear programming model for the optimisation of the technologies associated with energy supply and demand within the complete energy system of a country as it evolves over a given time period. It was developed in the course of a project sponsored by the International Energy Agency, which was carried out at two main centres: Kernforschungsanlage, Juelich, FRG, and Brookhaven National Laboratory, Upton, New York, USA. Australia's participation in the Project has enabled the latest version of MARKAL to be installed on the computer at the Lucas Heights Research Laboratories together with the necessary supporting software programs.

33472 **(DOE/ET/29008—1) Optimal stochastic operations scheduling.** (ALPHATECH, Inc., Burlington, MA (USA)). Nov 1983. Contract AC01-79ET29008. 104p. NTIS, PC A06/MF A01; GPO Dep. Order Number DE84014168.

This report presents the results of the third year of a 3-year project to develop improved methods for solving large-scale operations scheduling problems. A principal objective of this project has been to develop optimization procedures which will faithfully represent the operational constraints present in an electric power system. This report describes a new algorithm which gives optimal solutions while requiring less execution time than suboptimal methods.

33473 **(DOE/ET/29362—1) Contribution to power system state estimation and transient stability analysis.** (ESCA Corp., Bellevue, WA (USA)). Feb 1984. Contract AC01-79ET29362. 120p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84014170.

A well-established trend in the power system is the increase in control area interconnections and interdependent operating strategies. A more recent, but growing trend is a concomitant increase in information exchange. The former increases the dependence of one area's security upon the operating conditions of other areas, while the latter allows security assessment methods to more effectively account for these dependencies. The need to evolve state estimation technology, as these trends continue to evolve the nature of the problem, is the principle motivation for the direction taken in this area of development. A secondary focus of this research is on a particular aspect of the third security assessment activity. This is the assessment of a power system's capability to maintain synchronism following a major disturbance. Transient stability assessment today is not performed in the real time operating environment, because existing analysis methods are far too computationally intensive to be used. The significant level of manual interaction and judgement required is also a factor. In this area research on an uncertain, alternative assessment methodology, as opposed to existing method evolution, is motivated by the need to advance transient stability assessment towards real time operation.

33474 **(DOE/ET/29367—1) Operation of the large interconnected power system by decision and control in emergencies.** (Washington Univ., St. Louis, MO (USA). School of Engineering and Applied Science). Sep 1983. Contract AC01-79ET29367. 219p. NTIS, PC A10/MF A01; 1; GPO Dep. Order Number DE84014165.

Techniques for the computer aided operation and control of the large interconnected power system in its Normal, Alert, Emergency and Restoration conditions were in the process of development at Washington University under consecutive sponsorship by NSF-RANN, ERDA and DOE for the last 15 years. At this point at least a broad based consistent foundation for the computer aided operation and control of the large power system is accomplished. Since this body of results is now scattered in some 45 separate publications it seems timely to discuss the overall accomplishments in a summary fashion as is done here. These results differ from the state of art of the control centers on the power system in being more consistent and much more complete (e.g. computer aided emergency control or restoration as defined here are not state of art) more up to date in parts (e.g. automatic generation control has 1950's servomechanism implementation in the state of art) and most of all by being a mathematically and computationally sound large system approach taylored to the operating needs and basic structure of the system itself, not to the imposition of existing solution or computation techniques.

33475 **(DOE/RA/50418—1) Information flow in event-driven large-scale systems.** (ALPHATECH, Inc., Burlington, MA (USA)). Mar 1984. Contract AC01-80RA50418. 572p. NTIS, PC A24/MF A01; 1; GPO Dep. Order Number DE84014162.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

To bring into sharp focus the issues of real-time communication and coordination of distributed estimation and control agents, we concentrated our investigations on the class of event-driven stochastic systems. These systems are hybrid-state dynamical systems, whose state description consists of a control and operation related to emergency control, stability analysis, restorative control and security assessment. Thus the study of event-driven systems represented an important area for basic research in the design of distributed estimation and control algorithms for power systems operation. By focusing on event-driven systems, our research was able to examine explicitly the design and performance of different organizational structures, with variations in information aggregation strategies, event-directed communications and event-directed distributed control.

33476 **(DOE/RC/11334—T1) Electric utility coordination in the VACAR region: potential for savings 1983-2000.** (Ransom and Casazza, Inc., Washington, DC (USA)). 01 Sep 1983. Contract AC39-81RC11334. 301p. NTIS, PC A14/MF A01; 1; GPO Dep. Order Number DE84013936.

Portions are illegible in microfiche products.

The study described here was made to determine the potential benefits and costs of increased pooling and coordination activities among the utilities in the VACAR region. The Virginia-Carolina area (VACAR) utilities are interconnected and currently coordinate their operations to some degree. This study used the system and procedures as-planned by the VACAR utilities and existing institutional arrangements as a basis for comparison with alternative coordination scenarios. The study included the development of new computer modeling programs for analysis of the VACAR systems. The techniques included representation of the systems external to VACAR and an improved representation of transmission con-

straints. The analysis was separated into two phases. The first phase studies covered the 1983 to 1990 period for which expansion plans of the utilities are substantially underway and cannot be changed without considerable penalty. This phase focused on the potential of improved coordination of operations. The second phase of the analysis included the 1991 to 2000 period in which little commitment to expansion plans has been made. Focus of this phase was the potential of improved coordination of planning.

33477 **(DOE/RG/10063—T1) Relationships between consumers' attitudes and knowledge and the effect of time-of-use rate structures on electricity consumption: North Carolina.** (Michigan State Univ., East Lansing (USA). Center for Evaluation and Assessment). Sep 1981. Contract FG01-79RG10063. 48p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013293.

Portions are illegible in microfiche products.

The North Carolina Time-of-Use (TOU) Rate Demonstration Project examined the effects of various TOU rate schedules on residential consumers' electrical usage, including both total usage and temporal patterns of electricity consumption. This report summarizes the findings of a series of secondary analyses of the data derived from this demonstration project. These secondary analyses focused on the effects of consumers' knowledge of, and attitudes toward, the TOU rate structure to which they were assigned on both total electricity usage and temporal patterns of consumption. These analyses were made possible by the provision of an extensive exit interview, which was administered to all participants at the completion of the one year demonstration project. In addition, data on electricity usage, the dependent variable for these analyses, was collected throughout the duration of the demonstration project. After describing the general features of the demonstration project, this report presents the findings of secondary analyses undertaken to determine participants' knowledge of the TOU rate structures to which they were assigned, their attitudes toward TOU rate structures, and the relationships between these attitude and knowledge measures and electricity consumption. Findings are presented separately for the Carolina Power and Light Company (CP and L) and the Blue Ridge Municipal Electric Company.

33478 **(DOE/RG/10063—T3) Effects of consumers' attitudes and knowledge on the acceptance and utilization of time-of-use rates: Edmond, Oklahoma. Final report.** Crano, W.D.; Messe, L.A.; Buldain, R.W.; Johnson, C.D. (Michigan State Univ., East Lansing (USA). Center for Evaluation and Assessment). Aug 1980. Contract FG01-79RG10063. 80p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013297.

Portions are illegible in microfiche products.

The Edmond, Oklahoma, Time-of-use (TOU) Rate Demonstration Project was concerned with the effects of various TOU rate schedules on consumers' electrical usage. Both total usage and temporal patterns of electric consumption were studied in this demonstration. This report summarizes the results of a series of secondary analyses of data based on exit and followup surveys. These analyses were focused principally on the effects of consumers' knowledge of, and attitudes toward, the TOU rate structure to which they were assigned, and the impact of these reactions on their electric usage, relative to that of a comparable group of consumers.

33479 **(DOE/RG/10063—T4) Analysis of the psychometric properties and correlates of the central Vermont Public Service Corporation: 1980 survey of time-of-use and non-time-of-use electric customers.** Buldain, R.W.; Crano, W.D.; Hymes, R.W.; Messe, L.A. (Michigan State Univ., East Lansing (USA). Center for Evaluation and Assessment). Dec 1980. Contract FG01-79RG10063. 131p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE84013292.

Portions are illegible in microfiche products.

This report presents the results of a comprehensive analysis of a survey of electric utility customers served by the Central Vermont Public Service Corporation (CVPSC). This survey assessed the attitudes, behavioral reports, and household characteristics of a selected sample of residential customers of CVPSC. The present report summarizes and discusses the Center for Evaluation and Assessment's analyses of the psychometric properties of the customer survey and the relationships found between customer attitudes, reported behaviors, demographic characteristics, and residential features of the sample.

33480 **(DOE/RG/10063—T5) Critical review of Elrick and Lavidge's customer acceptance surveys.** Crano, W.D.; Messe, L.A. (Michigan State Univ., East Lansing (USA). Center for Evaluation and Assessment). 19 May 1980. Contract FG01-79RG10063. 43p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013294.

In the mid-1970's, the marketing research firm of Elrick and Lavidge, Inc. conducted a series of consumer attitude surveys with the goal of determining the degree of customer acceptance of a number of innovative electric rate schedules. An overview of customer attitudes and acceptance of various forms of existing and proposed electric utility rate schedules and tariff provisions. The report is a summary of the review of the major documents that Elrick and Lavidge produced for this study. Our report focuses on the technical quality of the work performed, and the extent to which the research that was conducted fulfilled the mission.

33481 **(DOE/RG/10063—T6) Cognitive factors that influence consumers' responses to innovative rate structures.** Crano, W.D. (Michigan State Univ., East Lansing (USA)). 1980. Contract FG01-79RG10063. 22p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013295.

This paper discusses the assumptions that have been made with regard to the price signal in the context of research on time-dependent electric rate structures, and demonstrates the impact on consumer behavior when these assumptions are not met. It summarizes the results of an investigation of consumers' understanding of the pricing manipulations employed in a DOE-sponsored time-of-use (TOU) demonstration experiment conducted in Edmond, Oklahoma. In addition, the impact of various TOU rate structures on consumers' electric consumption as a function of their understanding of the price signal is inspected. Finally, the factors that appear to influence such understanding is also discussed.

33482 **(NP—4770266) Public electric power industry in North-Rhine Westfalia, 1970-1981.** (Landesamt fuer Datenverarbeitung und Statistik Nordrhein-Westfalen, Duesseldorf (Germany, F.R.)). Apr 1983. 41p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84770266.

Portions are illegible in microfiche products.

Within the framework of the total energy supply situation the supply of electric power has become of increased importance within the past years. Particularly for a highly industrialized and densely populated country like North-Rhine Westphalia the development of the public electric power industry is thus of large interest. In the present publication data on the electric energy gained from the public supply network in NRW have been compiled for the first time. The user is now presented with some figures which are able to give a survey of the situation and development of the public electric power industry of NRW in the period 1970-1981. Not only technical and physical data are provided but also important conditions and backgrounds specific for this energy sector.

33483 **(PB—84-147198) Principles for electric power policy: appendices.** (Technology Futures, Inc., Austin, TX (USA)). 1983. 382p. NTIS, PC A17/MF A01.

See also PB84-147206.

An overview of the research design and methodology is provided. The tasks involved in conducting the assessment are examined, including: selecting research participants, developing a range of critical factor projections, conducting four workshops, preparing workshop materials, and writing the final report. Comments solicited from participants in an expert opinion survey are included on subjects such as capital costs of coal and nuclear electric capacity, lead times for central electrical power plants, and composition of future U.S. coal consumption. Survey participants are listed and their affiliations are noted. Two scenarios used as discussion vehicles at the assessment workshop held in January 1982 are considered. Opening remarks delivered at the workshops are provided and concerns raised by a panel of expert consultants are listed.

33484 **(PB—84-175041) Bibliography of the Maryland Power Plant Siting Program, Fifth Edition.** Magette, T. (Maryland Dept. of Natural Resources, Annapolis (USA). Power Plant Siting Program). Jan 1984. 68p. NTIS, PC A04/MF A01.

See also PB83-179051.

The Maryland Power Plant Siting Act of 1971 established the Power Plant Siting Program to insure that demands for electric power would be met in a timely manner at a reasonable cost while assuring that the associated environmental impact would be acceptable. The scope of the Program extends to estimating the impact of proposed new generating facilities, evaluating the acceptability of proposed transmission line routes, assessing the impact of existing generating facilities, acquiring sites for utilities unable to find a suitable site for generation, and investigating generic issues related to power plant site evaluation and associated environmental and land use considerations. This bibliography is a compilation of all the studies performed for and/or by the Power Plant Siting Program since its inception.

33485 **(SOL—84-1) Will planned electric capacity limit economic growth.** McAllister, P.H.; Stone, J.C. (Stanford Univ., CA (USA). Systems Optimization Lab.). Mar 1984. Contract AT03-76ER72018. 110p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84011867.

Portions are illegible in microfiche products.

In the face of strong economic and political disincentives, many electric utilities in the US are pursuing very cautious capacity expansion plans. The natural question is whether a sustained period of limited electric capacity growth can effectively inhibit potential economic growth, both in aggregate and in specific sectors of the economy. In this study, we use a significantly enhanced version of the Stanford PILOT economic model to investigate the economic consequences of an electric capacity shortfall. We developed six scenarios of future economic growth in the US, under a variety of assumptions on electric capacity growth rates and on foreign trade conditions. Analysis of scenario results suggests that a continuation of current trends in utility capacity expansion could produce a generation shortfall of about 1.1 tkWh in year 2000, relative to a scenario in which utility capacity expands to meet potential economic demand. This 27% shortfall produces a loss in economic output of about $100 billion per year by 2000. The loss in output does not extend to all economic sectors, however. Domestic production in the paper, steel, non-ferrous metals, and stone, clay, and glass sectors is reduced, while output in the trade, communications, machinery, and transportation equipment sectors is actually increased. The economic losses are most severe in scenarios with high imported oil prices or in which a political rationing scheme is used to allocate electricity shortfalls.

2980 Consumption And Utilization

33486 **(ESC-WR—83-26) Improvement of the energy efficiency: opportunities for industry.** Over, J.A. (Stichting Energieonderzoek Centrum Nederland, Petten. Energie Studie Centrum). Nov 1983. 28p. (In Dutch). ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

The ratio between energy costs and all other costs may differ considerably for the different industrial activities, and with them, the future attitudes and possibilities for improvement of energy efficiency. Since 1977 the energy efficiency has been improved by 10%, but probably this will increase much more. Several possibilities and recommendations are given, e.g. the so-called Energy Centers, combined power/heat generating units for users in industrial concentrations. Other opportunities for industry are measures to improve energy conservation by the whole population which can give employment and profits for trade and industry.

33487 **(ORNL—6050) Transportation Energy Data Book: Edition 7.** Holcomb, M.C.; Koshy, S. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 182p. NTIS, PC A09/MF A01; 1; GPO Dep. Order Number DE84013766.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This document is the seventh edition of the Transportation Energy Data Book, a statistical compendium compiled and published by Oak Ridge National Laboratory (ORNL) under contract with the Office of Vehicle and Engine Research and Development in the Department of Energy (DOE). The data book was designed for use as a desk-top reference, presenting statistics that characterize transportation activity and data on other factors that affect transportation energy use. The publication displays relevant statistical data in the form of tables and graphs. Each of the major transportation modes (highway, air, water, rail, and pipeline) is treated in separate chapters or sections. Aggregate energy use and energy supply data for all modes are presented in Chapter 1. The highway mode, which accounted for 73.3% of total transportation energy use in 1981, is dealt with in Chapter 2. Topics covered in this chapter include vehicle stock characteristics, fuel efficiency, fleet automobiles, buses, and trucks. Chapter 3 presents data on each of the nonhighway modes: air, water, pipeline, and rail, respectively. Chapter 4 profiles the motor vehicle industry with historical trends in vehicle and engine characteristics. Economic indicators related to the industry are also presented.

33488 **(NE—1983-8) Consulting about wood and peat as fuels.** Grundberg, O.; Johansson, H.; Knudsen, F. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). Mar 1983. 80p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751008.

Portions are illegible in microfiche products.

The energy flow in the County of Vaesternorrland is considerable. The main components of the flow are electrical energy, fuels based on wood, and oil. The consumption of the tree kinds of energy is about 600 thousand tons of oil equivalents (t oe). The project work was focused on fields where the Provinces own solid fuels were supposed to replace oil used for heating and in industrial processes. The work of the project group was primarly aimed at three target groups: wood-fuel and peat producers, energy consumers, equipment manufacturers. The experience of the project, is as follows: The technical conditions of rapid development of the production and offer of wood fuel (wood and sawmill waste) are good. The conditions of peat are different. The supplies are moderately large and tradition as for production is none. Yet three heavy projects are in progress. On the other hand efforts are needed to increase the consumption of domestic fuels and thus the demand. It is the opinion of the project group that the advisory service of the community concerning solid domestic fuels could and should be more vigorous. Advisory service must be combined with the demonstration of running plants where the positive results are convincing.

33490 **(ECN—140) Fossil fuel fired closed cycle MHD power generating experiments.** Flinsenberg, H.J. (Stichting Energieonderzoek Centrum Nederland, Petten). Dec 1983. 182p. NTIS (US Sales Only), PC A08/MF A01. Order Number DE84750911.

A study has been made of the generator performance during a series of power runs of the 5 MWth blow-down facility, which has been built in order to achieve realistic closed cycle MHD power generating experiments from a fossil fuel operation for

longer test times. The analysis is directed towards an understanding of the overall generator performance in relation with the experimentally observed discharge structures. To study the plasma composition, discharge structures and electrical generator performance, a number of diagnostic tools have been developed. Recombination radiation measurements, absorption measurements, line intensity measurements, high speed photography, mass-spectrometry, laser Mie scattering measurements and both high frequency resolved and time averaged electrical measurements are performed. The experiments with the blow-down facility up to now have shown the generation of a substantial electric power of 362 kWe. A constricted discharge structure (in the form of streamers) is always observed in these experiments, having a substantial degree of ionization of the seed material and a large current density (up to 10/sup 6/ A/m2). A streamer model has been developed to analyse the flow field in- and outside the discharge structure. The results show the existence of a pronounced vortex flow inside the streamer. From this the solid body concept of the streamer is introduced in a new generator model, describing the major interaction terms of the streamer and the background gas. A reasonable agreement has been found between the predicted generator performance and the measured generator performance in the first half of the generator. A substantial deviation from the theory has been found in the experiment for the last part of the generator due to Hall shorting phenomena that occur in this part of the generator.

33491 **A survey of recent work on explosive-driven magnetic flux compression generators.** Caird, R.S.; Erickson, D.J.; Fowler, C.M.; Freeman, B.L.; Garn, W.B. (Los Alamos Scientific Laboratory, Los Alamos, NM 87545). pp 1-18 of Energy storage, compression, and switching. Vol. 2. Nardi, V.; Bostick, W.H.; Sahlin, H. New York, NY; Plenum Publishing Corporation (1983). (CONF-751247—).

From Colloquium on thermal insulators at high temperature; Paris, France (3 Dec 1975).

This chapter describes and compares the characteristics of spiral, coaxial, strip, plate and cylindrical implosion systems. Discusses the use of switching, fuses and transformers for sharpening or impedance-matching the output pulse of the generators. Outlines some of the areas of application of the generators. Points out that much of the recent work at Los Alamos has been directed toward the development of the plate generator, which consists of a transmission line with explosive slabs on the flat surfaces. The plates may be parallel or at an angle to each other. A plane detonation front in the explosive allows a large area of conductor to be driven simultaneously, resulting in very high power and current outputs. Discusses results of tests on the plate generator, which is well suited to driving low impedance plasma devices.

33492 **Flux compression generators as plasma compression sources.** Fowler, C.M.; Caird, R.S.; Erickson, D.J.; Freeman, B.L.; Garn, W.B.; Thomas, D.B. (Los Alamos Scientific Laboratory, Los Alamos, NM). pp 19-42 of Energy storage, compression, and switching. Vol. 2. Nardi, V.; Bostick, W.H.; Sahlin, H. New York, NY; Plenum Publishing Corp. (1983). (CONF-751247—).

From Colloquium on thermal insulators at high temperature; Paris, France (3 Dec 1975).

This chapter surveys applications where explosive-driven magnetic flux compression generators have been or can be used to directly power devices that produce dense plasmas. Discusses representative examples that are specific to the theta pinch, the plasma gun, the dense plasma focus and the Z pinch. The examples are used to illustrate the high energy and power capabilities of explosive generators. An application employing a rocket-borne, generator-powered plasma gun emphasizes the size and weight potential of flux compression power supplies. Provides recent results from a local effort to drive a dense plasma focus. Discusses imploding liners in the context of both the theta and Z pinches.

33493 **(CONF-840853—3) Molten carbonate fuel cell cathode development.** Smith, J.L.; Kaun, T.D.; Minh, N.Q.; VanDeventer, E.H.; Mrazek, F.C.; Pierce, R.D. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012101.

From International Society of Electrochemistry; Berkeley, CA, USA (5 Aug 1984).

Portions are illegible in microfiche products.

From the results obtained so far, Li_2MnO_3 and $LiFeO_2$ look promising as cathode materials for the MCFC. The materials have low solubility in the molten electrolyte and do not migrate under cell operating conditions. However, further studies of their resistivity is required before they can be fully assessed. Zinc oxide does not appear to be a good cathode material candidate due to its high solubility and its incorporation into the $LiAlO_2$ matrix, although the conductivity of doped ZnO is low enough for its application as a cathode.

33494 **(DOE/FE/15078—1613) Molten carbonate fuel cell performance model update. Quarterly report, October 1983-December 1983.** Wilemski, G.; Kemp, N.H. (Physical Sciences, Inc., Andover, MA (USA)). Mar 1984. Contract AC21-81FE15078. 59p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84012932.

This report contains a detailed description of a new porous electrode model, termed the heterogeneous film model, which is intended to be a reasonable depiction of ERC's ceramic coated Ni anodes and to serve as a first approximation to GE's and ANL's Ni/Cr anodes. In this model the electrode is pictured as a highly crosslinked three-dimensional network of Ni or Ni/Cr filaments. The Ni or Ni/Cr is coated by a porous layer of ceramic or chromite. Most of the fine-scale porosity of the electrode is found in the layer. Consequently most of the electrolyte resides in this layer which then forms a heterogeneous film on the Ni or Ni/Cr surface. The film coated Ni or Ni/Cr network is idealized as a random packing of short cylinders. The theoretical development of the model includes mathematical descriptions of ionic conduction, liquid phase diffusion through the heterogeneous film, and electrode kinetics on the Ni or Ni/Cr surface. Arguments based on conservation of porosity are used to express the geometric parameters of the model in terms of a few observable properties of the electrode. This report also contains a detailed mathematical analysis of the development of vertical concentration gradients in the gas flow channels. A general solution is presented and applied to the cathode and anode flow channels. Application to the anode requires some modifications due to the occurrence of the water gas shift reaction on the channel hardware surfaces.

33495 **(DOE/NASA/0201—4) Evaluation of gas-cooled pressurized phosphoric acid fuel cells for electric utility power generation. Final technical report.** Farooque, M. (Energy Research Corp., Danbury, CT (USA)). Sep 1983. Contract AI21-80ET17088. 81p. (NASA-CR—168298). NTIS, PC A05/MF A01; GPO Dep. Order Number DE84013886.

Gas cooling is a more reliable, less expensive and a more simple alternative to conventional liquid cooling for heat removal from the phosphoric acid fuel cell (PAFC). The feasibility of gas-cooling has already been demonstrated in atmospheric pressure stacks. This report presents theoretical and experimental investigations of gas-cooling for pressurized PAFC. Two approaches to gas cooling, Distributed Gas-Cooling (DIGAS) and Separated Gas-Cooling (SCG) were considered, and a theoretical comparison on the basis of cell performance indicated SGC to be superior to DIGAS. The feasibility of SGC was experimentally demonstrated

by operating a 45-cell stack for 700 hours at pressure, and determining thermal response and the effect of other related parameters.

32 ENERGY CONSERVATION, CONSUMPTION, AND UTILIZATION

33506 **(DOE/BP—237) Long-range conservation projection.** (USDOE Bonneville Power Administration, Portland, OR. Div. of Planning and Evaluation). May 1984. 91p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013681.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Conservation planning analysis and assumptions and conservation program and sector acquisition levels are presented. Each of the consuming sectors - residential, commercial, industrial, and irrigation - are described in some detail. Energy consumption data and conservation potential estimates are presented. The acquisition strategy describes each subsector in terms of end uses impacted, typical measures, measure life, costs, and market characteristics. The sector strategy is compared to the Council plan. Bonneville Power Administration's plans for developing and refining knowledge in each sector are described. Each sector development plan focuses on BPA's objectives to improve knowledge in its estimates of technical and market potential for conservation, environmental impacts and possible mitigation strategies, new technologies, and alternative financing.

33507 **(ESC-WR—83-24) Investment in energy conservation. A review of possibilities.** Boonekamp, P.G.M.; Goumans, J.J.J.M.; Kram, T.; van der Veen, J.C.; van Wees, F.G.H. (Stichting Energieonderzoek Centrum Nederland, Petten. Energie Studie Centrum). Oct 1983. 182p. (In Dutch). ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

This report contains the conclusions of a study of possible measures which can lead to the reduction of energy costs via investments in energy conservation and energy conversion technologies. The following end-users are investigated: agriculture, buildings, residential buildings, services, transportation and industry.

3201 Buildings

33508 **(AD-A—137230/9) Evaluation of shelter ventilation by model tests, option 1 - below ground shelters. Final report Sep 82-Dec 83.** Krishnakumar, C.K.; Koh, J.B.; Fields, S.F.; Henninger, R.H. (GARD, Inc., Niles, IL (USA)). Dec 1983. 60p. NTIS, PC A04/MF A01.

Update to report dated Mar 83, AD-A126765. Includes summary dated Sep 83.

Wind-induced ventilation rates that could be achieved in a 100-man below-ground shelter with simple designs of passive flow enhancement devices (FEDs) were estimated by scale model tests in a low-speed wind tunnel. Air volume flow rates through the model were determined by using bubble flow tracers and motion photography. Test results indicate that adequate ventilation can be achieved in the type of shelter considered by the use of FEDs even at relatively low wind speeds. The study also generated guidelines for the relatively low speeds. The study also generated guidelines for the design of FEDs and their placement around stairway openings. In addition, estimates of reductions in ventilation rates due to an obstruction upstream of the windward FED and due to a decrease in the area of wall openings were made.

33509 **(BMFT-FB-T—84-067) Development and testing of a diesel-powered compression heat pump for domestic central heating systems.** Coutelle, R.; Danninger, W.; Gaiser, P.; Nguyen, N.V.; Scheid, E.; Schulte, H.; Eibl, H. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Apr 1984. 254p. (In German). NTIS (US Sales Only), PC A12/MF A01. Order Number DE84751774.

Portions are illegible in microfiche products.

A diesel-powered air-to-water heat pump with engine-speed control for domestic central heating systems has been developed and tested. A monovalent operation and high flow-temperature of approx. 70°C have been realized. Piston-type compressors and a screw-type compressor have been examined. Based on the experimental results, a computer program was compiled to simulate the operation of the heat pump during an entire heating period. By modifying the combustion process of the diesel engine, the soot and NOsub(x)-emissions were reduced up to 50% and the HC-emissions up to 15% of the corresponding initial values. Some prototypes have been installed in domestic central heating systems for long-time tests.

33510 **(CONF-840801—9) Raman spectroscopy measurements of flame quenching in a duct-type crevice.** Fairchild, P.W.; Fleeter, R.D.; Fendell, F.E. (TRW Space and Technology Group, Redondo Beach, CA (USA). Engineering Sciences Lab.). 1984. Contract AC04-78ET13329. 25p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84009328.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

Portions are illegible in microfiche products.

Flame/wall interactions in a duct-type crevice (simulated by two parallel walls) have been investigated by making Raman scattering measurements of the spatial temperature profile for a range of wall separations and flame stoichiometry. Experiments using both cold (isothermal) and hot (adiabatic) walls in an atmospheric pressure premixed propane/air flame show that as the wall separation is reduced opposite quench layers begin to interact. The effect is more severe for the leaner fuel mixtures where the flame speed has been reduced. Results with a hot wall show the reduced quench layer thickness that is associated with the flame front position moving closer to the wall.

33511 **(CONF-840801—10) Laminar flame propagation/quench for a parallel-wall duct.** Carrier, G.F.; Fendell, F.E.; Feldman, P.S. (Harvard Univ., Cambridge, MA (USA); TRW Defense and Space Systems Group, Redondo Beach, CA (USA). Engineering Sciences Lab.). 1984. Contract AC04-78ET13329. 24p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84009773.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

Steady laminar isobaric two-dimensional propagation of a fuel-lean large-activation-temperature premixed flame between plane parallel (isothermal noncatalytic) walls is examined theoretically. A Shvab-Zeldovich engineering-type formulation, with a treatment of convective transport of species and heat in the manner of Oseen, is integrated numerically by quasilinearization/alternating-direction-implicit techniques. Of particular interest in this transcendentally nonlinear elliptical (convective-diffusive-reactive) boundary-value problem is how the flame speed (an eigenvalue) decreases as the well separation decreases, for different wall temperatures. At a finite wall separation the quenching distance is achieved, such that the flame speed goes abruptly to zero; this critical quenching distance is found to be smaller for hotter walls. This investigation seeks to lend credibility of principle to one possible strategy for reducing the level of unburned-hydrocarbon species exhausted from Otto-cycle-type cylinders. The primary source for hydrocarbon emissions is now generally acknowledged to be the failure of flame to propagate into the narrow piston crevice owing to heat loss to cold walls. Higher wall temperature at the piston crown and rings would seem to abet flame propagation and assist burn-up during the combustion event; also, persistent fuel vapor would be discharged at higher temperature into the hot, oxygen-rich bulk cylinder contents during the power-stroke expansion.

33512 **(DOE/CS/60038—4) Saving money through energy conservation in manufactured housing.** (Indiana Dept. of Commerce, Indianapolis (USA)). 1984. Contract FG45-76CS60038. 24p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012709.

Portions are illegible in microfiche products.

Things to look for in buying a new manufactured home are discussed. Site orientation is discussed and energy saving tips for heating, cooling, hot water heating, kitchen, dishwasher, laundry, and lighting are presented. A glossary is included. (MHR)

33513 **(DOE/IR/08323—T1) Energy cost reduction for retail florists.** (Department of Energy, Washington, DC (USA)). 15 Dec 1977. Contract AI01-76IR08323. 60p. Society of American Florists, 901 N. Washington St., Alexandria, VA 22314. Order Number TI84009552.

This handbook shows retail florists how to recognize and act on energy waste in lighting, heating, refrigeration, delivery, and greenhouse operations. The following are included: a summary of savings, energy management, greenhouse, assessing energy needs, economic projections, and record monthly use and expenditures. Twenty-one methods of saving money in the retail florist business are presented. (MHR)

33514 **(DOE/OR/20890—2) Test procedures for rating residential heating and cooling absorption equipment.** Weber, B.; Radermacher, R.; Didion, D. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Apr 1984. Contract AI05-81OR20890;AC05-84OR21400. 78p. (NBSIR—84-2867). NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013413.

Portions are illegible in microfiche products.

Test and rating procedures are presented for gas-fired absorption devices operating in either the heating or cooling modes. These procedures are designed to include the effects of part-load and cyclic operation, variations in outdoor temperature, and frost formation during the heating mode. Both air-source and ground water source absorption heat pumps are considered, as well as air cooled and ground water cooled air conditioners and water chillers. A calculation procedure is presented for estimating the heating and cooling seasonal performance and cost of operation of residential water chillers, air conditioners, and heat pump units.

33515 **(ISI-B—8-82) Present situation and energy consumption of space HVAC systems in the Federal Republic of Germany.** (Fraunhofer-Gesellschaft zur Foerderung der Angewandten Forschung e.V., Karlsruhe (Germany, F.R.). Inst. fuer Systemtechnik und Innovationsforschung). 1982. 39p. (In German). (FLT—3/1/80/82). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751777.

Portions are illegible in microfiche products.

The present study deals with the availability of data which will help to estimate the present number of complete heating, ventilation and air conditioning systems and air conditioners and their energy consumption. The types of data will have a decisive influence on the choice of method and the comprehensiveness of the preliminary assessment carried out here. Details on the systems in operation are given on the basis of the input as installed because of the wide variations in dimensions of the systems.

33516 **(KTM/E-D—19) Follow-up of an air heating system functioning by air circulation in the rooms of a block of flats.** (Ministry of Trade and Industry, Helsinki (Finland). Energy Dept.). 1983. 102p. (In Finnish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751037.

Portions are illegible in microfiche products.

Results from an experimental research work in a block of flats with warm air heating system are presented. The energy consumption, performance of heating and ventilation, and indoor climate were studied with data collecting system, manual measurements and interviews. The test building is situated in Lappeenranta in South-eastern Finland. It is constructed of concrete elements, the floors are partly the partition walls are built of concrete hollow blocks, which are also utilized as supply air ducts. The building is connected in district heating network. The experimental character

of the building was taken into account since early design stage. The follow-up period ended in July 1982, until the results are analyzed. In evaluating the warm-air system, special attention is paid to following aspects: how the components work, especially together, is the system too complicated, is it easy to use, is it worth developing and where development is needed. All observed problems in performance were analyzed. The results from the project can be summarized as follows: the construction and installations succeeded as a whole. The supply air ductwork, including the joints between hollow blocks, is airtight, and its dynamic performance is very good also in summer. The air flows into and from various rooms were well adjusted. Also the building envelope is airtight enough. The utilization of free heat sources was, however, lower than calculated, because of many technical problems in the building, which mostly were not caused by the warm air heating system itself. The system can be considered as worth applying and developing, both technically and economically. The various aspects concerning the use and maintenance must be taken into account to quarantee the total performance of the system.

33517 **(LBL—17196) High-intensity discharge (HID) solid-state ballast program: engineering development report. Phase II.** Carlson, R.S. (Lawrence Berkeley Lab., CA (USA)). Dec 1983. Contract AC03-76SF00098. 44p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013882.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A high frequency (28 to 31°K Hz) electronic current source (ballast) designed to drive a 200 watt 100 volt sodium vapor gas discharge lamp is described. A resonant switching power amplifier system utilizing a novel constant power feedback loop is employed to maintain the lamp input power constant within two percent via changes due to lamp aging etc. The lamp input power and therefore the light output is adjustable from 50 to 100 percent of rated power. A input (electronic filter) inverter, changes the 277 volts alternating voltage input to a regulated direct current (DC) voltage used to power the output stage. The inverter reflects, a essentially unity power factor load to the power input source at all times.

33518 **(LBL—17444) CONTROLITE 1.0: program documentation.** (Lawrence Berkeley Lab., CA (USA)). Mar 1984. Contract AC03-76SF00098. 87p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84013884.

This computer program, CONTROLITE, provides an unbiased mathematical model from which comparisons can be made, on an economic basis only, of how different lighting control systems perform. The program has the option of calculating daylighting values as input. Calculations can also be done on simple control sytems which do not respond to daylighting. For purposes of allowing for the calculating of daylighting values, program CONTROLITE is augmented with an accurate yet quick subprogram QUICKLITE. QUICKLITE employs what is known as the daylight factor method for calculation of daylighting values. The major components of the program are discussed in this documentation and several examples are included to explain how to run the program. Appendix C contains a report of the scope of work performed to bring CONTROLITE to its present form.

33519 **(LBL—17476) Skylight energy performance and design optimization.** Arasteh, D.; Johnson, R.; Selkowitz, S.; Sullivan, R. (Lawrence Berkeley Lab., CA (USA)). Feb 1984. Contract AC03-76SF00098. 8p. (EEB-W—84-03; CONF-840610—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013389.

From Windows in building design and maintenance conference; Gothenburg, Sweden (13 Jun 1984).

Portions are illegible in microfiche products.

Proper skylight utilization can significantly lower energy requirements and peak electrical loads for space conditioning and lighting in commercial buildings. In this study we systematically explore the energy effects of skylight systems in a prototypical office building and examine the savings from daylighting. The DOE-2.1B energy analysis computer program with its newly incorporated daylighting algorithms was used to generate more than 2000 parametric simulations for seven US climates. The parameters varied include skylight-to-roof ratio, shading coefficient, visible transmittance, skylight well light loss, electric lighting power density, roof heat transfer coefficient, and type of electric lighting control. For specific climates we identify roof/skylight characteristics that minimize total energy or peak electrical load requirements.

33520 **(NBSIR—84-2816) Laboratory evaluation of the steady-state and part load performance of absorption type heating and cooling equipment.** Radermacher, R.; McLinden, M.; Klein, S.; Didion, D. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Mar 1984. Contract AI05-81OR20890;AC05-84OR21400. 91p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013414.

Portions are illegible in microfiche products.

In this investigation, an absorption water chiller and absorption heat pump were extensively tested under steady-state and cyclic operating condtions. Since the tests were performed on two different units, one for a cooling only and one for a heating only application, the report is set up in two parts discussing the results of the testing of each unit separately. In addition to the black box tests of the units, the causes for the degradation during part load operation were investigated in more detail using the absorption chiller and determining that migration of the fluids during the off periods are a major contribution to the degradation. Furthermore, the influence of various heating water temperatures and flow rates and the sensitivity to the charge was more closely investigated employing the absorption heat pump.

33521 **(NP—4770329) Influence of the interior design of a room on the room temperature curve and the heating energy.** Ruefenacht, A. (Eidgenoessische Technische Hochschule, Zurich (Switzerland)). 1981. 178p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE84770329.

Portions are illegible in microfiche products.

This thesis contains a numerical method for the calculation of layer and surface temperature of any coated building component with any temperature curves for both sides. It is shown how interior heat sources and insolation of the surface can be included into the calculation. The effects of variations of the influence of the outer temperature on the energy household of buildings are of special interest; the main interest however is concentrated on the inner components.

33522 **(NP—4901204) Evaluation of the Missouri Division of Energy's project conserve class B energy audit project.** Barnett, D.R. (Missouri Dept. of Natural Resources, Jefferson City (USA). Div. of Energy). 25 Apr 1984. 27p. NTIS, PC A03/MF A01. Order Number DE84901204.

Portions are illegible in microfiche products.

A posttest control group telephone survey was used to document the results of the Division's Project Conserve Energy Audit Project. The survey found no attributable energy savings. Several contributing factors as to why not were hypothetized. Most likely cause was seen as the shotgun audit distribution method used by the Division of Energy which did not address those homeowners most in need of an energy audit.

33523 **(ORNL/CON—159) Development of advanced thermal insulation for appliances.** McElroy, D.L.; Yarbrough, D.W.; Copeland, G.L.; Weaver, F.J.; Graves, R.S.; Tong, T.W.; Fine, H.A. (Oak Ridge National Lab., TN (USA)). Jul 1984. Contract AC05-84OR21400. 71p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013132.

The development of thermal insulation with an apparent thermal conductivity of less than 0.0072 W/(m K) (equivalent to a thermal resistance per inch thickness of 20 ft^2 h °F/Btu) is discussed. A theoretical model that includes radiative and conductive heat transfer shows that the target thermal resistance can be attained by combinations of very fine powders and reduced pressures. Apparent thermal conductivities of fine powders were measured with three apparatuses. A linear heat flow measurement demonstrated apparent thermal conductivities as low as 0.0087 W/(m K) (R per inch = 16.6 ft^2 h °F/Btu) for evacuated panels containing fine particles. Radial heat flow measurements on fine powders as a function of temperature, gas pressure, and bed density showed that

apparent thermal conductivities below the target value can be achieved with pressures below 100 Pa. The radial heat flow measurements also demonstrated the existence of an optimum mass fraction solid in the powder insulations.

33524 **(ORNL/Sub—81-7762/301) Simulation and performance of a system using an R-12/R-114 refrigerant mixture.** Stoecker, W.F.; McCarthy, C.I. (Illinois Univ., Urbana (USA). Dept. of Mechanical and Industrial Engineering). May 1984. Contract AC05-84OR21400. 112p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE84013568.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The objective of this combined analytical and experimental study is to determine energy conservation possibilities through the use of a refrigerant mixture in a refrigerator or heat pump. The system is one with two evaporators that are operated at different temperatures levels, and the basic approach was to maintain constant refrigeration loads and temperatures throughout a series of tests wherein the composition of the refrigeration mixture was altered. The experimental measurements consisted of the determination of temperatures and pressures throughout the system, energy flow rates and compressor power, and boiling and condensing heat-transfer coefficients as the fraction of R-114 in the mixture varied from 0.0 to 0.6. In order to maintain the fixed refrigeration capacity in the two evaporator and decreased through the condenser as is expected for a refrigerant mixture. System simulation predicted an 8 percent saving in compressor power for an optimum 68 percent R-114 mixture (of R-12/R-114) in comparison to R-12 alone. The experimental results at this stage show about a 2 percent reduction in power in the range 10 to 15 percent R-114 in the mixture.

33525 **(PB—84-160175) Investigation into the control of a domestic gas fired boiler using mathematical models. Technical memo.** Marchant, S.J.; James, R.W.; Osborne, W.C. (Polytechnic of the South Bank, London (UK). Inst. of Environmental Science and Technology). Jan 1980. 64p. (TM—74). NTIS, PC E05/MF E05.

A mathematical model describing the dynamic and steady state behavior of a small domestic, high thermal capacity, gas fired boiler has been derived. In addition, equations have been added to the model to represent the behavior of a lounge, with its heating system, and a domestic hot water cylinder. The model has been used to investigate the influence of the control system on system efficiency and energy consumption for part load operation of the boiler.

33526 **(PB—84-160183) Dynamic analysis of an experimental rig incorporating a domestic gas fired boiler. Technical memo.** Marchant, S.J.; James, R.W.; Osborne, W.C. (Polytechnic of the South Bank, London (UK). Inst. of Environmental Science and Technology). Oct 1979. 47p. (TM—68). NTIS, PC E04/MF E04.

An experimental rig has been designed and developed to investigate the dynamic and steady state behavior of a small central heating gas fired boiler. A mathematical model of the complete system has been derived and is being used in conjunction with the rig to investigate the transient behavior of heating systems and their control.

33527 **(PB—84-160563) Integrated heating system; technical and economic case.** Russell, F.M. (Rutherford Appleton Lab., Chilton (UK)). Dec 1983. 17p. (RL—83-121). NTIS, PC E03/MF E03.

The results of recent work directed at optimizing a thermal store and heat pump combination for space heating purposes are reported. A novel feature is the use of an integral thermal energy management system. (Copyright (c) Science and Engineering Council 1983.)

33528 **(PB—84-160845) Dynamic behaviour of domestic boilers and their domestic hot water and central heating systems. Technical memo.** Marchant, S.J.; James, R.W.; Osborne, W.C. (Polytechnic of the South Bank, London (UK). Inst. of Environmental Science and Technology). Mar 1979. 51p. (TM—65). NTIS, PC E05/MF E05.

The purpose of this survey is to review the results of investigations into the relative merits of low and high thermal capacity boilers and their thermal performance when integrated within wet central heating systems. The efficiency of domestic hot water production out of the space heating season has also been considered.

33529 **(PB—84-162817) Analysis of a building space heating system and its control strategy.** Florez, J.; Barney, G.C. (Manchester Univ. Inst. of Science and Technology (UK). Control Systems Centre). Jun 1983. 23p. NTIS, PC E03/MF E03.

Based on the observed temperature profile distribution, the idea of an automatically balanced heating system is proposed and the installation of solenoid valves is suggested. These will divide the building heating system into different zones which can operate independently of each other. A new control strategy based on self-tuning controllers is developed which will reduce the commissioning time normally needed to match the controller to the thermal characteristics of the building and heating system.

33530 **(PB—84-163088) Economies in the use of energy obtained by using decorative textiles. Final report.** Vancolen, P. (Centre Scientifique et Technique de l'Industrie Textile Belge (CENTEXBEL), Brussels). 1980. 18p. (In Flemish). NTIS, PC E03/MF E03.

The principle ways in which heat is lost from a room are outlined and a general summary is given as to how the use of textile wall and floor coverings can effect energy savings. A more rigorous study is then given showing how the thermal resistance of partitions can be improved by the use of insulation materials. Also dealt with is heat loss at windows and how window sills and curtains can be utilized to reduce this energy dissipation.

33531 **(PB—84-167428) Approximate thermal analysis for a regenerative air heater.** Atthey, D.R. (Central Electricity Generating Board, Southampton (England). Technology Planning and Research Div.). 1982. 25p. (TL—383). NTIS, PC E03/MF E03.

This report describes an approximate thermal analysis of a regenerative air heater. The approximation used relies on the fact that the dimensionless periods are not too large, a condition which is made more precise in the report, and which is true for all CEGB power station air heaters. The method gives time averaged fluid outlet temperatures which are equivalent to those deduced from Hausen's analysis. The method also gives the variation of fluid and heat exchange element temperatures with position and time, and is generalized to cover the case of a heater fitted with two sets of heat transfer elements with significantly different heat transfer properties.

33532 **(PB—84-171412) Comparison of hot water preparation in electrical store boilers and combination boilers with oil and gas firing.** (Elektrowirtschaft, Zurich (Switzerland)). 1980. 206p. (In Swedish). NTIS, PC E11/MF E11.

A comparison is made between hot water preparation in electrical storage boilers and combination boilers with oil and gas firing, emphasizing the onesided dependency of Swiss power supply on petroleum and the type of oil consumption for heating, stressing the fact that oil should be used preferably in the pharmaceutics industry and plastics chemistry.

33533 **(PB—84-171537) Gas-fired duplex free-piston Stirling refrigerator. Annual report Nov 82-Oct 83.** Urieli, I. (Sunpower, Inc., Athens, OH (USA)). Dec 1983. 28p. NTIS, PC A03/MF A01.

The duplex free-piston Stirling refrigerator is a potentially high efficiency, high reliability device which is ideally suited to the home appliance field. In particular as a gas-fired refrigerator. It has significant advantages over other equivalent devices freedom from halogenated hydrocarbons, extremely low temperatures available at a high efficiency, and simple burner system control. This report describes the design and development of a portable working demonstration gas-fired duplex Stirling refrigeration unit in order to demonstrate the technology to potential manufacturers. A necessary factor in the development of a Stirling prime mover system is the

use of a sophisticated computer aided development code. This requires continued interaction between the theoretical analysis and practical testing and evaluation. The technical approach was designed around this requirement. A universal test rig was developed in order to separately test and evaluate the major subunits, subsequently enabling a smooth system integration phase and a verified baseline for future system scaling.

33534 **(PB—84-171586) Electricity-driven heat pump.** (Elektrowirtschaft, Zurich (Switzerland)). 1980. 61p. (In Swedish). NTIS, PC E05/MF E05.

Whereas the physical foundations of the construction of heat pump heating systems have been known for a long time, the development of heat pumps is still in progress. The condensers for smaller facilities have been standardized and are built in serial construction, the remaining components need to be adapted in most cases to special situations, thus making facilities more expensive. An obstacle to the manufacture of standardized heat pump facilities is mainly the diversity of heat sources, their different quality and yields. Purchase of a serially constructed heat pump would be desirable for small-scale construction, connectable to the heat source and the heat distribution system, as it is possible for oil firing and with electrical resistance heating systems. Development trends go in this direction. For larger-scale facilities, some more time will elapse before this goal is reached.

33535 **(PB—84-171602) Electrical room heating.** (Elektrowirtschaft, Zurich (Switzerland)). 1982. 88p. (In Swedish). NTIS, PC E06/MF E06.

This SKEW room heating report deals chiefly with use of existing free power capacities for room heating. The following energy-policy criteria must here be noted: Part of night energy must be reserved for operating pump storage power plants so that they can carry out their real task of covering peak requirements. Another part of night power must be reserved for hot water preparation to reduce the uneconomic petroleum use in this sector. These criteria, together with the anticipated needs of the other users, provide the remaining power capacities for electrical room heating. These capacities must be used rationally and logically, one condition being a general reduction in energy consumption for room heating which can be achieved by changing consumer habits, better building insulation and use of more efficient heating systems.

33536 **(PB—84-174457) Commercial cooking equipment improvement. Annual report Jul 82-Jun 83.** Himmel, R.L. (American Gas Association Labs., Cleveland, OH). Sep 1983. 49p. NTIS, PC A03/MF A01.

See also PB84-100924.

This report describes the efforts of a project aimed at improving the thermal efficiency of gas-fired commercial cooking equipment, specifically the development of a commercial open top section employing powered burners and the development of means for applying pulse combustion burners to closed top portions of commercial ranges and griddles. Three approaches to designing powered burners were designed and constructed which have efficiency improvements of up to 50 percent over contemporary open burner systems. Two of the designs will have turndown capabilities while the third system is designed to be a single input auxiliary system. Preliminary results indicate that the time to heat water can be cut in half. A pulse combustion fry top or griddle was designed, constructed and successfully operated in the pulse mode. It is unique in its geometry and volume. Further efforts are necessary to obtain the temperature distribution required for consistent cooking operations.

33537 **(PB—84-175033) Development of a pulse combustion space heater. Annual report Mar 82-May 83.** Thrasher, W.H. (American Gas Association Labs., Cleveland, OH). 30 Jun 1983. 72p. NTIS, PC A04/MF A01.

A prototype model of a low-cost, high efficiency pulse combustion space heater was developed that operated satisfactorily and had a steady state thermal efficiency approaching 92 percent. The unit operates in a condensing mode and heat transfer occurrs from a combustion chamber, exhaust pipe and a secondary heat exchanger. The design operates at 18,000 Btu/hr, utilizes outdoor air for combustion and vents the flue products directly outdoors in a manner similar to conventional direct vent appliances. An oval-shaped burner is selected as being most promising from an operational standpoint and the ability to physically fit within the confines of a contemporary sized or smaller cabinet. Further development work leading to the construction of advanced prototypes is planned. A field test of ten units to characterize the operational characteristics and user acceptance of the appliance is scheduled for the 1983-84 heating season. The space heater will benefit both the consumer and the gas industry by providing a space heating appliance that has efficiencies approaching those of unvented gaseous and liquid fueled heaters without the disadvantages of venting combustion products into the conditioned area.

33538 **(PB—84-179761) Efficiency and emissions improvement of gas-fired space heaters. Task 1. Efficiency improvement of vented heaters. Final report 1 Feb-31 Jul 83.** Zawacki, T.S.; Cole, J.T.; Huang, V.M.S.; Banasiuk, H.; Macriss, R.A. (Institute of Gas Technology, Chicago, IL (USA)). Mar 1984. 39p. NTIS, PC A03/MF A01.

This report assesses various methods of improving the steady state and annual fuel utilization efficiencies (AFUE) of gas-fired vented space heaters.

33539 **(PB—84-179878) Characterization of emissions from a fluidized-bed wood chip home heating furnace. Final report Apr 82-May 83.** Truesdale, R.S. (Research Triangle Inst., Research Triangle Park, NC (USA)). Mar 1984. 74p. (RTI—1914-70-01F). NTIS, PC A04/MF A01.

The report gives results of measurements of emissions from a residential wood-chip combustor, operated in both a fluidized-bed and cyclone-fired mode, and their comparison with those from a conventional woodstove and industrial wood-fired boilers. In general, the combustion efficiency of the fluidized-bed and cyclone-fired wood-chip burner is higher than that of conventional woodstoves. Concomitant with this increase in efficiency is a decrease in most emissions. For the fluidized-bed tests, significant reductions of total hydrocarbons and CO were observed, compared to woodstove emissions. The cyclone test showed PAH levels far below those of conventional woodstoves, approaching levels measured in industrial wood-fired boilers. A baghouse, installed during two fluidized-bed tests, was extremely effective in reducing both particulate and PAH emissions. Method 5 samples from above the fluid bed suggest that appreciable PAH is formed in the upper region of the furnace or in the watertube heat exchangers. In general, the cyclone-fired mode was more effective in reducing emissions from residential wood combustion than the fluidized-bed mode.

33540 **(PNL-SA—12234) Buildings innovative concepts.** Lee, V.E. (ed.). (Pacific Northwest Lab., Richland, WA (USA)). 1984. Contract AC06-76RL01830. 184p. (CONF-8405106—). NTIS, PC A09/MF A01; GPO Dep. Order Number DE84013410.

From Building innovative concepts fair; Arlington, VA, USA (23 May 1984).

In 1982 the Office of Energy Systems Research within the US Department of Energy (DOE) initiated the Innovative Concepts Program to identify immature concepts having the potential for saving substantial amounts of energy and to provide seed money for a preliminary investigation of their technical feasibility. This report provides information on the 12 innovative buildings concepts selected for further examination. The approach used in this project assumes that (a) good concepts come from experienced, knowledgeable investigators, (b) innovators frequently generate more good ideas than can be used within their own organizations, and (c) ideas are frequently generated in an organization unable to appropriate the benefits of further development. Therefore, other industrial organizations or federal agencies may be interested in providing financial support for further development of such concepts. This project is an experiment in a continuing program to harvest creative, novel approaches to saving energy. A competitive solicitation was used to screen proposed concepts and subsequently to provide seed money for a limited number of concepts. Concepts were sought (a) combining the functions of two or more materials, (b) providing dynamic control of the functions of building materials, or (c) overcoming barriers to widespread use of current energy-saving technology in buildings. The seed money approach funded a

preliminary investigation of the technical feasibility of each concept. The innovative concepts presented in this report and briefly summarized below are organized under three major headings: daylighting, building materials, and building systems. Each chapter heading lists the subcontracting organization responsible for the work and their principal investigator(s) and author(s), and Appendix A lists their addresses.

33541 **(SBI-R—149) Collective heat inspection of groups of owner-occupied houses.** Als, J.K.; Andersen, N.E.; Jensen, O.; Kjelstrup, S.; Moerk, P. (Statens Byggeforskningsinstitut, Hoersholm (Denmark)). 1983. 80p. (In Danish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751002.

Portions are illegible in microfiche products.

So far heat inspection and energy-saving measures in owner-occupied houses have almost exclusively been carried out separately in individual houses and for individual owners. The present report describes a method which may be used for collective performance of heat inspection and energy-saving measures in large groups of relatively uniform owner-occupied houses. The procedure described comprises the following phases: 1. Contact between energy consultant and houseowners' association. 2. First meeting of houseowners' association where owners who want to join the scheme will notify this. 3. Heat inspection and submission of report to owners. 4. Second meeting of houseowners' association,Description of the proposed energy-saving measures.

33542 **(SBI-R—151) Laboratory testing of joints between windows and highly insulated cavity walls. Investigations of tightness against rain and wind.** Kjaer, A. (Statens Byggeforskningsinstitut, Hoersholm (Denmark)). Oct 1983. 36p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751003.

EFP-80.

In the Danish energy research programme, 1EFP 80, a number of laboratory tests have been carried out on models of highly insulated cavity brick walls in order to study rain- and wind tightness of the joints between windows and such walls. Tests have been carried out with joints tightened only with a rain barrier as well as with joints according to the two stage joint principle. In the exterior part of the joint has in both cases been used a mortar, and expanding gasket, an EPDM-profile and wooden battens. Further an experiment has been carried out on a plastic window, where mastic was used as well in the exterior as the interior part of the joint. The findings were that a two-stage joint gives the best performance as well regarding air tightness as rain tightness. Further the experiments have shown that a window frame should have a depth of at least 90 mm in order to design a joint between window and wall, which is satisfactory as well regarding thermal insulation as resistance to rain and wind.

33543 **(UCRL—90252) Experimental and modeling study of engine knock.** Smith, J.R.; Green, R.M.; Westbrook, C.K.; Pitz, W.J. (Sandia National Labs., Livermore, CA (USA); Lawrence Livermore National Lab., CA (USA)). 19 Jan 1984. Contract AC04-76DP00789;W-7405-ENG-48. 23p. (CONF-840801—4). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84006134.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

Raman and emission spectroscopy, laser induced fluorescence, schlieren photography, and gas sampling have been used in a single cylinder, spark ignition engine to study preflame conditions and reactions that lead to knock. The intake manifold temperature and pressure were used to control the fraction of fuel autoigniting in a 5.1 compression ratio engine. N-butane, isobutane, and propane were studied, but only n-butane and isobutane were found to knock under the range of achievable inlet conditions. Detailed kinetics modeling predicts the trends in the autoignition delay times. Preflame reactions involving OH and CH radicals producing carbon monoxide, formaldehyde, and faint blue light were observed, however, the inclusion of a low temperature reaction scheme had little effect on calculated ignition delays.

33544 **(DOT-I—83-02) Transportation energy contingency planning, quantifying the need for transit actions.** Boyle, D.K. (New York State Dept. of Transportation, Albany (USA)). Jan 1983. 109p. NTIS, PC A06/MF A01. Order Number TI84901216.

Portions are illegible in microfiche products.

This report provides a simple, rapid method for anticipating or reacting to a peak-hour transit capacity problem brought about by an energy shortfall. The first step is determining when peak-hour capacity should be increased on a given route. This is done through use of the Capacity Problem Index (CPI) developed here. A worksheet is provided for calculating the CPI, and the results lead the transit operator directly to recommendations for what should be done to increase peak-hour capacity. Three packages of recommendations are provided for use depending on the severity of the peak-hour capacity problem. The body of the report serves as a manual for transit operators wishing either to plan for various energy scenarios or to take action in a crisis. The appendices contain a more detailed analysis, including sections on the evaluation of peak-hour capacity-expending options, the responses of 45 transit operators to the 1979 energy shortfall, and the development of the Capacity Problem Index.

33545 **(DOT-I—83-20) Scenario planning: energy considerations in the long range urban transportation planning process.** (Regional Planning Council, Baltimore, MD (USA)). May 1983. Contract AI01-81CS90103. 253p. NTIS, PC A12/MF A01; 1; GPO Dep. Order Number DE84013590.

Portions are illegible in microfiche products.

This report documents an 18-month study funded by the Department of Energy and the Department of Transportation which aimed at incorporating energy conservation in regional planning framework. The study was a prototype application of scenario analysis in the public planning context. The scenario technique is a comprehensive approach which allows consideration of the interaction of energy issues with transportation as well as other planning concerns such as land use, technological change, and economic development. The project created several hypothetical futures typified by varying levels of oil availability, and constructed sets of policy responses designed to deal with the problems typifying those future conditions. It is concluded that unique insights were gained which would not have emerged in the course of more conventional planning activity; still, because so many new issues were raised, follow-up efforts to fully incorporate the findings and methodology into the continuing planning process are crucial to the ultimate success of the project.

33546 **(LA-UR—84-1490) Refueling considerations for liquid-hydrogen fueled vehicles.** Stewart, W.F. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 32p. (CONF-841219—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012623.

From 5. intersociety cryogenics symposium; New Orlenas, LA, USA (9 Dec 1984).

Portions are illegible in microfiche products.

Liquid hydrogen is a possible fuel for transportation applications in the future. Such use of liquid hydrogen will require a refueling station analogous to today's service station for gasoline and diesel fuels. The cryogenic nature of liquid hydrogen and concerns for safety indicate the desirability of a refueling system that is automated as completely as possible and incorporates sufficient redundancy for safe and reliable operation. A refueling system designed on the basis of previous experience with liquid hydrogen transfer systems has been developed, and a preliminary system has been built and tested. A series of tests was conducted to determine the extent of the liquid hydrogen losses during a refueling operation and to determine optimum transfer procedures and conditions.

33547 **(PB—84-150341) Energy conservation and cost saving related to highway routine maintenance: data collection and analysis of fuel consumption. Report for Jan-Dec 82.** Sharaf, E.A.; Sinha, K.C.; Yoder, E.J. (Purdue Univ., Lafayette, IN (USA). Joint Highway Research Project). 15 Dec 1982. 114p. NTIS, PC A06/MF A01.

Sponsored in part by Indiana Dept. of Highways, Indianapolis.

This report presents the results of a study aimed at the identification of fuel consumption by various types of equipment used in highway routine maintenance activities in the State of Indiana. Two basic groups of results are discussed: (1) fuel consumption rates for all possible activity-equipment combinations as well as total fuel consumed per production unit of each activity; and (2) the effect of factors such as location (subdistrict), highway type, and season on fuel consumption. The first group of results will be of direct use to the Indiana Department of Highways (IDOH) in the planning of the annual maintenance program, while the second group will be useful in evaluating the actual fuel use (in the field) by different management units (subdistricts).

33548 **(PB—84-163245) Assessment of the San Diego light rail system. Technical report (final).** McGean, T.J.; Haussmann, J.G.; Lee, M.T.; Watzich, J.; Bamberg, W. (Lea (N.D.) and Associates, Inc., Washington, DC (USA)). Nov 1983. 219p. (NDL—41-VI). NTIS, PC A10/MF A01.

Prepared in cooperation with Gannett Fleming Transportation Engineers, Inc., Harrisburg, PA.

This report documents an assessment of the San Diego Light Rail Transit (LRT) system which began revenue service on July 26, 1981. The objectives of this assessment are: to document early planning leading to the decision to build, essentially without federal funding; to document the system that was built entirely with limited state and local funds; to assess the performance and operation of this system; to assess the applicability to other cities of this low-budget approach for providing rail transit service; and to provide urban planners with information to assist them in determining whether this type transit can meet their specific needs. This report is limited to an assessment of the original first phase system which began operation in July 1981.

33549 **(PB—84-178383) Passenger train equipment review report. Volume 2. Propulsion system components and future train energy consumption. Final report Feb-May 81.** (Unified Industries, Inc., Springfield, VA (USA)). May 1981. 304p. NTIS, PC A14/MF A01.

See also Volume 1, PB84-178375, and Volume 3, PB84-178391. Prepared in cooperation with Battelle Columbus Labs., OH., Carnegie-Mellon Univ., Pittsburgh, PA. Transportation Research Inst., and Marchetti (J. W.), Inc., Natick, MA.

Early in 1977, the Federal Railroad Administration, Office of Research and Development, initiated the Improved Passenger Equipment Evaluation Program (IPEEP), which was designed as a detailed systematic review of advanced passenger trains and equipment throughout the world that could possibly be used in the United States. During the course of this program, the members of the IPEEP Train System Review Team prepared 24 technical papers, in addition to the basic set of IPEEP reports covering baseline data and individual train reviews and a separate report on train performance methodology. This volume of six papers covers traction motor drives, modern slip detection and control systems for electric locomotives and multiple-unit cars, onboard high-voltage switchgear for electric locomotives and multiple-unit cars, high-voltage protection and switching control for Northeast Corridor vehicles, pantographs, and the energy consumption of future passenger trains.

3203 Industry And Agriculture

REFER ALSO TO CITATION(S) 32562, 33400, 33507, 33622

33550 **(AD-A—140085/2) Field demonstration of three-phase Wanlass motors. Final report Aug 81-Apr 83.** Dann, G. (Naval Civil Engineering Lab., Port Hueneme, CA (USA)). Jan 1984. 97p. (NCEL-TN—1686). NTIS, PC A05/MF A01.

Electric motors are major part of the load at Naval shore facilities. The Naval Civil Engineering Laboratory (NCEL) investigated the Wanlass motor as a means of reducing power consumption, reducing current flow, and improving power factor, as compared to standard motors. NCEL surveyed the literature on single-phase and poly-phase Wanlass motors and tested poly-phase Wanlass motors. Efficiency, current, power factor, load sharing, temperature rise, vibration and noise, torque-speed, and reliability were judged. A reduction in current flow and a corresponding improvement in power factor can be expected with the Wanlass rewind. A small improvement in efficiency - a reduction in power consumption - is possible but not certain. It was recommended that Wanlass rewinds not be purchased on the basis of energy savings or power factor improvement.

33551 **(BMFT-FB-T—84-003) Quick and complete recovery of the precious metals of low-grade sweeps and scrap.** Jung, V. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Jan 1984. 35p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751419.

Portions are illegible in microfiche products.

The increasing industrialization caused a continuous rise in the demand for precious metals, so that the natural resources were no longer sufficient; new recycling processes had to be developed. The special aim of the original project was the treatment of Ag- and Au-bearing materials in order to recover the precious metals (blast furnace-, converter-process). By comparison the treatment of materials with relatively high content of Pt-group metals (PGM) was much more complicated. So the new project had to develop new techniques to improve the recovery by collecting the PGM in copper (blast furnace). The PGM-bearing copper bullions were then treated in a converter for separating the impurities and to collect them in a special slag, and then build a copper litharge for leaching; a copper melt was left containing the PGM. The cast anodes were then submitted to an electrorefining-process. The efficiency of the recovery of the PGM in the whole process could be raised to 90%.

33552 **(CONF-840804—1) Investigation of thermal stability of fluorinol-85 and 2-methylpyridine/water as Rankine Cycle Power Systems working fluids.** Jain, M.L.; Demirgian, J.; Hillis, D.L. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84006420.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Results of the experimental investigation to date, indicate that Fluorinol-85 could be utilized in Organic Rankine Cycle Power Systems (ORCPS) to a maximum cycle temperature of 550°F without any discernable decomposition over an extended period of time. However, at 575°F, Fluorinol-85 could possibly decompose between 1 and 3% per year depending upon system design considerations. 2-methyl-pyridine/water could have possibly less than a 2% annual decomposition rate at 600°F maximum cycle temperature.

33553 **(DOE/CS/40297—T1) Factory demonstration energy efficiency of powered hand tools. Final report.** (Varigas Research, Inc., Timonium, MD (USA)). [nd]. Contract AC03-79CS40297. 201p. NTIS, PC A10/MF A01; 1; GPO Dep. Order Number DE84004840.

The results of a field demonstration program to determine the relative energy efficiencies of different types of powered hand tools used under actual operating conditions are presented. Three manufacturing plants in different geographical locations, dealing primarily in three diverse operations, were equipped with alternate air and electric tool systems. These systems included energy converters, distribution systems, matched tools and all energy measurement and reporting instrumentation. Under normal, day-to-day, operating conditions the different tool systems were employed for periods of time sufficient to collect statistically reliable data on energy consumption. The basic conclusion of this work is that, in the applications studied, dedicated pneumatic tool systems will average

more than thirteen times as much energy as high cycle electric tool systems powered by rotary frequency converters while performing the same tasks. Conventional plant air systems may use, by comparison, more power per unit work achieved. Moreover, when chosen carefully and applied properly, the electric tools sometimes equal or outperform their pneumatic counterparts in terms of productivity, cost effectiveness, and user acceptance. However, any alteration of tooling entails complex subjective factors and customs so that effecting changes can risk, at least temporary, decreases in productivity.

33554 **(ORNL/TM—9072) Performance test results of a lithium bromide-water absorption heat pump that uses low-temperature [60°C (140°F)] waste heat. Final report.** Huntley, W.R. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 64p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013129.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

An absorption heat pump for upgrading industrial waste heat to process steam temperatures has been developed and successfully tested at Oak Ridge National Laboratory. The heat pump uses lithium bromide and water as the working fluids and is designed to operate with waste heat temperatures ranging from 60 to 100°C (140 to 212°F). Performance data from the 45-kW(t) (12.5-ton) prototype heat pump have shown good agreement with theoretical predictions. Advantageously, most of the energy for operation comes from the waste heat, with only low inputs of electrical energy for parasitics; electrical coefficients of performance ranging from 50 to 85 have been demonstrated. This feature makes the heat pump attractive from the standpoint of energy conservation. The successful operation of this absorption heat pump prototype has demonstrated that this concept is an easily operated and practical candidate for energy recovery from waste heat in industrial applications where low-temperature process steam is needed. An adiabatic absorber section was incorporated into this machine to allow the diluted absorbent to reach its maximum temperature before delivering heat to the load. However, the kinetics of the absorption reaction were faster than anticipated from the design calculations, and this feature was not advantageous for operation with lithium bromide-water. The prototype heat pump tested is a single-stage machine, but two-stage versions have been theoretically evaluated which could obtain about twice the temperature boost when required. An economic analysis shows attractive payback times over a wide range of operating temperatures.

33555 **(PB—84-152347) Industrial waste heat recovery and the potential for emissions reduction. Volume 1. Main report. Final report 25 Oct 77-28 Mar 79.** (Energy and Environmental Analysis, Inc., Arlington, VA (USA)). Feb 1984. 270p. NTIS, PC A12/MF A01.

This report examines the applicability of conservation equipment to various industrial sectors, determines the net costs involved, and assesses the potential for conservation as a means of air pollution control. Predictions of the amount of waste heat available from U.S. industrial sources were made and a waste heat inventory was established. The inventory is segmented by industrial group, industry, process, and flue gas temperature. The waste heat recovery equipment analysis determined the costs and applications of a variety of waste heat recovery equipment. The analysis examined five major equipment types and their limitations. Cost functions were developed which used furnace flue gas flow rate and temperature, and air preheat temperature as inputs. A discussion of the major factors to be considered for the development of heat recovery equipment also is included. A discussion on the availability and development of high temperature burners and the effects of high preheat temperature on ancillary equipment is included. High preheat temperatures result in higher flame temperatures and correspondingly higher NOx emissions. This issue also has been addressed in this report. Volume 1 describes study methodology and findings. Volumes 2 through 10 tabulate stack gas waste heat inventories for all the industrial processes studied.

33556 **(PB—84-152354) Industrial waste heat recovery and the potential for emissions reduction. Volume 2. Standard Classification Codes 1-01-001-01 to 1-02-007-03. Final report 25 Oct 77-28 Mar 79.** (Energy and Environmental Analysis, Inc., Arlington, VA (USA)). Feb 1984. 524p. NTIS, PC A22/MF A01.

33565 **(PB—84-155225) Geotechnical quality assurance of construction of disposal facilities. Final report Apr-Dec 82.** Spigolon, S.J.; Kelley, M.F. (Army Engineer Waterways Experiment Station, Vicksburg, MS (USA)). Feb 1984. 192p. NTIS, PC A09/MF A01.

This report presents four major topics related to the permittee's responsibilities during construction,operation, and closure of a hazardous waste disposal facility: (1) geotechnical parameters that should be tested and/or observed, (2) selection of sampling methods and sample sizes for the geotechnical parameters, (3) laboratory and field testing methods for investigating geotechnical parameters, (3) laboratory and field testing methods for investigating geotechnical parameters, and (4) a quality assurance program suited to the unique responsibilities of the permittee. The purpose of the report is to provide technical background for use by permittees, designers, specifiers, quality assurance engineers, and permit writers for hazardous waste disposal facilities. The document addresses the quality control aspects of construction, operation, and closure of a hazardous waste disposal facility (it is assumed that the quality aspects of site selection, characterization, and design have already been managed). Types of facilities covered by the report include landfills, surface impoundments, waste piles, and land treatment units.

33566 **(PB—84-171594) Electric boilers.** (Informationsstelle fuer Elektrizitaetsanwendung, Zurich (Switzerland)). 1983. 49p. (In Swedish). NTIS, PC E04/MF E04.

Electric boilers have been used in Switzerland since 1920 for industrial heat supply, but oil boilers began to replace them to the extent that their energy consumption dropped from 1,000 GWh in 1950/51 to 120 GWh by 1980/81. This study examines whether petroleum substitution might again be possible in the process heat sector. This means heavy-duty electric boilers of up to 60 t/h, 1 - 40 MW connecting power and 380 V to 20 kVconnecting voltages. They can be used to generate hot water and/or saturated steam. Electric boilers make about the same demands on feed water as fossil-fired low-pressure steam boilers. Maintenance costs for electric boiler are somewhat lower. In bivalent operation with a fossil-fired boiler, electric boilers can be switched without too many problems. Network problems are chiefly those of covering grounding, for which every installation must be checked individually.

33567 **(PB—84-174713) High-efficiency commercial water heater development. Annual report Jan-Dec 83.** Demetri, E.P.; Vasilakis, A.D.; Gerstmann, J. (Advanced Mechanical Technology, Inc., Newton, MA (USA)). Jan 1984. 58p. NTIS, PC A04/MF A01.

The development of a condensing water heater for commercial applications has been completed. The selected concept consists of a high-efficiency water heater connected by appropriate plumbing to a stratified-temperature storage tank. A number of pre-production prototypes have been fabricated and installed at nine representative commercial sites. Field tests were initiated in April 1983. These consist of a side-by-side comparison with the existing conventional water heater at each site. The test results obtained to date demonstrate standby loss rates less than one-fifth of conventional values and service efficiencies which average 33% higher than conventional system efficiencies. The comparative performance data obtained under actual usage conditions show that the condensing water heater would provide average annual cost savings of $950 per year and corresponding paybacks in the range of 0.6-1.5 years.

33568 **(PB—84-174895) Heat recovery with a condensor and a direct contact heat exchanger.** de Jong, E.J.; van der Linden, J.P. (Technische Hogeschool Delft (Netherlands). Afdeling der Werktuigbouwkunde). Sep 1983. 77p. (In Dutch). NTIS, PC E05/MF E01.

33569 **(PB—84-180637) Ceramic fiber insulated furnace research program. Annual report Jul 81-Sep 82.** Kiefer, J.R.; Sodolak, L.S. (Cameron Iron Works, Inc., Houston, TX (USA)). Jan 1983. 122p. NTIS, PC A06/MF A01.

See also PB81-202004. Color illustrations reproduced in black and white.

The objective of this program is to determine methods for Energy Conservation through the use of ceramic fiber insulation (i.e. alumina-silicate man made fibers). Ceramic fiber-products will be tested in the same modes of construction: (1) Ceramic fiber layered construction, (2) Ceramic fiber veneer, (3) Ceramic fiber modules, for test comparison with the State-of-Art hard refractories (brick and/or castables). The ceramic fibers have excellent thermal stability and low heat storage. In both, hard refractory and ceramic fiber tests, the calculated wall temperature profiles are higher than the measured values. This indicates that the published thermal conductivities are higher than actual values. The savings in fuel used for layered ceramic fiber amounted to 40% less than the hard refractory lined furnaces under the same test conditions. The fuel used for the hard refractory (18 inches) plus ceramic fiber veneer (3 inches) was 31% less than hard refractory furnace under the same test conditions. Fuel savings as high as 57% have been noted in ceramic fiber lined test furnaces (Batch Operation).

33570 **(VTT-TIED—190) Energy research in the mechanical forest industry 1980-1982. Literature survey of wood panel industry.** Soeyrilae, P.; Koskela, K.; Jaervi, A. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Mar 1983. 86p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland. Order Number TI84751041.

The total energy consumption of plywood production is about 7.7 GJ/m³. About 70% of thermal energy goes to veneer drying. The biggest energy saving have been achieved by influencing the drying process: the amount of the exhaust air of the dryer is adjusted as low as possible, the filling degree of the dryer is kept as high as possible, the final moisture content of veneer is raised as high as the gluing process allows, the changes in the initial moisture content of veneer are considered in drying either with the aid of the adjusting automatics of the dryer or by a primary grading of veneers. In the manufacture of particle board the total energy consumption is in average 3.6 GJ/m³. The energy amount needed for particle drying can be diminished by striving at a final moisture content of particles that is as even and as high as possible, by using the dryer at the highest possible filling degree, by raising the drying temperature and by recirculating the exhaust gas. In the production of fibreboard the total energy consumption is in average 9.3 GJ/t (hardboard) and 13.7 GJ/t (insulation board). The energy consumption can be diminished especially in defiberizing by softening the chips more effectively either by lengthening the time for preheating

or raising the pressure or by using some additional chemical, e.g. NaCH. Softening can be carried out by leading the waste steam from defibrator intochip silo for melting and preheating the chips.

33571 **(VTT-TUTK—149) Energy research in the mechanical forest industry 1980-1982. Energy saving in the manufacture of fibreboard.** Jaervi, A. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Jan 1983. 50p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland. Order Number TI84751042.

The aim of the investigation was to clarify whether energy can be saved in defiberizing in the manufacture of fibreboard by adding a suiting chemical to chips in the preheating phase or by leading the waste steam from defibrator into chip silo. The effect of chemicals was investigated both by laboratory and mill tests. The chemicals used were lye (NaOH) and sodium bisulphite ($NaHSO_3$). Although the results show saving in the consumption of electric energy, the profit is not great enough to cover the expenses incurred on the chemicals. An additional charge is the increase in the waste water load especially when lye is used. In connection with the investigation of the use of waste steam also an adaptable equipment was being developed. The tests carried out thereafter showed that the amount of fresh steam used in preheating can be decreased by leading waste ssteam from defibrator into chip silo. The saving gained is of size class 125 kg steam per produced pulp ton. If the price of thermal energy is estimated to be 32 Fmk/GJ,Savings of 11 Fmk per pulp ton are gained by procedures mentioned above. The total annual production of such mills that can exploit waste steam in this way is abt. 125 000 t. This means a possibility to save abt. 1.4 mill.Fmk yearly. The investments needed are of size class 150 000 mk.

33572 **(VTT-TUTK—160) Energy research in the mechanical forest industry 1980-1982. The energy service of integrates.** Tarvainen, V. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Mar 1983. 19p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland. Order Number TI84751040.

An inquiry about the energy management of the mechanical forest industry was sent to production units consisting of two or more factories. 29 integrates answered to the inquiry, and 21 answers were applicable to further investigation and analysis. Their total energy production was 7530 TJ in 1979, which covered one third of the total energy demand of the mechanical forest industry. The integrates' production of thermal energy exceeded their own consumption. Regarding electricity, the average self-support degree was only 40%. Two thirds of the energy was produced by domestic energy sources, 20% were purchased fuels. The most important domestic energy source was bark. The proportions of chips, sawdust and peat were 13.1%, 16% and 14.7%. The rest consisted of water power and miscellaneous wood combustibles. The most important foreign fuel was oil, also natural gas and coal were used. The figures mentioned above may not be generalized because at least in minor plants the use of by-products as fuel is not always profitable. Such plants buy their electricity and produce heat by means of oil.

33573 **(VTT-TUTK—161) Energy research in the mechanical forest industry 1980-1982. Energy consumption in the impregnation of poles and sawn timber.** Tarvainen, V.; Mansikkamaeki, P. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Mar 1983. 30p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland. Order Number TI84751035.

Energy consumption in the impregnation of poles and sawn timber in 1979 was studied by addressing an inquiry to the biggest impregnation plants. Information was requested on power and heat consumption and on power installed in separate process phases. For background information, some aspects of the production process were also requested. The plants which answered the inquiry produced about one half of the 302 000 cubic metres of timber impregnated in 1979. The average consumption of electricity was 51 MJ/m^3 . The heat needed in the impregnation of poles by creosote oil was 651 MJ/m^3. In the impregnation of poles by waterborn preservatives the heat consumption was on an average 56 MJ/m^3 and in the impregnation of sawn timber 42 MJ/m^3. The total power consumption by all impregnation plants was 15.4 TJ and the heat consumption 104 TJ. THe impregnation industry accounted for 0.4% of the power consumption and 0.5% of the heat consumption of the whole mechanical forest industry. The energy consumption of impregnation in different plants varied very much. The deviations from the smallest consumption are partially due to differences in the technical level of the plants and variation in raw material. With some suitable technical solutions and organizational actions it is obviously possible to gain great savings.

33574 **(VTT-TUTK—200) Energy research in the mechanical forest industry 1980-1982. Energy consumption in the particle board industry.** Usenius, A.; Koskela, K. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Jul 1983. 49p. (In Finnish). Valtion Teknillinen Tutkimuskeskus, Espoo, Finland. Order Number TI84751036.

Energy consumption in the manufacture of particle board in 1979 was clarified by means of an inquiry. Questionnairies were sent to thirteen particle board mills,All of which answered the questions. The total production of the particle board industry was about 790 000 m^3,One fifth of which was processed products. On an average 1.5 m^3 wood raw material and 1.6 direct working hours were needed per one cubic metre of manufactured particle board. The values of installed power calculated per annual capacity varied from 43 W/m^3 to 88 W/m^3 when the average was 57 W/m^3. The total installed power of the Finnish particle board industry was about 59 000 kW. The specific energy consumption as for electricity varied from 145 kWh/m^3 to 273 kWh/m^3 when the average was 183 kWh/m^3. With reference to heat, the specific energy consumption varied from 2.2 GJ/m^3 to 3.3 GJ/m^3 when the average weighted by production was 2.74 GJ/m^3. The proportion of heat of the total energy consumption was on an average 79%. The process stages that consumed most electricity were the pretreatment of wood and screening, in which the energy consumption was 30%. The consumption in the drying and screening of particles was about 20%. The drying of particle, in which 80% of thermal energy was consumed, was clearly the most heat consuming process stage. The Finnish particle board industry consumed 145 GWh of electrical and 2 169 TJ of thermal energy in 1979.

33575 **(AD-A—139861/9) Initial feasibility report on decentralized small cogeneration for Navy shore bases. Final report 1 Oct 82-30 Sep 83.** McCold, L.N.; Karnitz, M.A. (Oak Ridge National Lab., TN (USA)). Feb 1984. 81p. NTIS, PC A05/MF A01.

This report presents the results of an assessment of decentralized small cogeneration application for Navy shore facilities. For the purpose of this study, small cogeneration includes packaged, preengineered cogeneration systems with electric generating capacities below about 500 kW. The characteristics of the available small cogeneration equipment are collected and summarized. The available energy use data on hospitals, unaccompanied enlisted personnel housing (UEPH) and unaccompanied officer personnel housing (UOPM) at four Navy bases are analyzed. A method for applying small cogeneration equipment to such facilities is developed and used. The energy and economic characteristics of these applications are summarized and discussed. Four economically attractive decentralized small cogeneration applications are identified.

33576 **(ANL/CNSV-TM—134-Vol.3) Study of existing RDF-cofiring experience. Volume 3. Phase II final report.** Fiscus, D.E.; Ege, H.D.; Petersen, R.D.; Glaub, J.C.; Joensen, A.W.; Wolfs, K.E.; Savage, G.M. (Midwest Research Inst., Kansas City, MO (USA)). Oct 1983. Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The major factors of design and operation of the boiler system, which includes the boiler, materials handling of RDF to the boiler, materials handling of bottom ash from the boiler, and other

auxiliaries are covered. RDF fuel properties and the major considerations of RDF processing are discussed. The emphasis is on the major factors of utility boiler design and operation and on viewing RDF as a fuel in the same manner as any other fuel would be. The basic concern is that existing utility boilers were designed for one type of solid fuel (coal) and cofiring RDF presents the boiler with a fuel mix whose properties are different from those for which the boiler was designed. For new boilers, the designers must take into account a fuel mix with different properties than normally used. For both retrofit and new boilers, boiler operations will be different when cofiring RDF than when firing coal only. This document presents results of the review of the state of the art of electric utility RDF projects.

33577 **(BNL—34540) Computer models and district heating and cogeneration feasibility analysis.** Reisman, A.W. (Brookhaven National Lab., Upton, NY (USA)). 1984. Contract AC02-76CH00016. 11p. (CONF-8406132—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012902.

From 75. annual international district heating conference; Bretton Woods, NH, USA (17 Jun 1984).

Portions are illegible in microfiche products.

Estimation of the economic and technical feasibility of a district heating or cogeneration project involves the collection, integration, and assessment of large quantities of technical, market, and financial data. The emergence of the computer as an accessible and cost-effective tool available to all has begun to open up possibilities for easing this analytic burden in the first planning phase (Phase I - initial project analysis) and second planning phase (Phase II - detailed project design). This paper examines the benefits of using computer models in the analysis of district heating and cogeneration projects and provides a checklist for model selection. In addition, mention is made of the International District Heating Association (IDHA) Models Handbook project, which has as its goal the identification and description of existing public and proprietary district heating and cogeneration models which are available today to assist project planners to design large-scale community energy systems.

33578 **(DOE/CS/20544—T1) Pulsed-flow air classification for waste to energy production. Final report.** Peirce, J.J.; Vesilind, P.A. (Duke Univ., Durham, NC (USA). Center for Environmental Engineering). 30 Sep 1983. Contract AC05-79CS20544. 153p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84013655.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The development and testing of pulsed-flow air classification for waste-to-energy production are discussed. Standard designs generally permit large amounts of combustible material to escape as reject while producing a fuel that is high in metal and glass contaminants. Pulsed-flow classification is presented as a concept which can avoid both pitfalls. Each aspect of theory and laboratory testing is summarized: particle characteristics, theory of pulsed-flow classification, laboratory testing, and pulsed-flow air classification for waste-to-energy production. Conclusions from the research are summarized.

33579 **(DOE/RA/50327—1) Tri-County solid waste-to-fuel production project feasibility study.** (ECO Corp., Washington, IL (USA)). Sep 1983. Contract FG01-80RA50327. 425p. NTIS, PC A18/MF A01; 1; GPO Dep. Order Number DE84013547.

The analysis and preliminary findings of refuse-derived fuel and recovered components markets are presented. Other topics covered are: municipal solid waste composition, quantity and constraints; technical assessment and capital cost assessment; economic feasibility of burning process residue to generate steam; review of commercially available equipment for the densification of refuse-derived fuel; final pre-feasibility analysis for the Tri-County Municipal Solid Waste to Fuel Production Project; preliminary economic and sensitivity analysis for the Tri-County Project; risks assessment for the Tri-County Project; and environmental, health, safety, and socioeconomic assessment for the Tri-County Project. (MHR)

33580 **(ORNL/CON—152) Analysis of a small steam district heating system at Ft. McClellan, Alabama.** Pine, G.D. (Oak Ridge National Lab., TN (USA)). Jul 1984. Contract AC05-84OR21400. 46p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84014421.

An analysis to identify major causes for heat loss from one steam district heating system at Ft. McClellan, Alabama, has been made. Because only limited information based on measurements was available, we took measurements of condensate ejected from traps and of ground temperature profiles above buried steam pipes and combined these limited data with analyses of the building heat loads, heat loss from the buried pipelines, and the steam flow through the pipes to develop estimates of the energy efficiency of the distribution system. Based on these estimates, we concluded that the system efficiency (steam delivered to the buildings/steam entering the distribution system) is approximately 53%. Major identified sources of heat loss include conduction losses enhanced by the deterioration of the pipe insulation and flooding of valve pits and pipe conduits by the buildup of groundwater and condensate after failures of sump pumps. Leaks of prime steam do not appear to be a significant source of loss. Measures recommended to reduce the heat losses include providing better maintenance for sump pumps in vaults and reducing the operating pressure of the steam system. The latter measure is the more effective of the two. We estimate that reducing the operating pressure from its present 100 to 50 psig would reduce heat losses by 15% and would save the Army an estimated $43,000/year.

33581 **(PB—84-155175) Cogeneration: status and environmental issues. Final report Jun 79-Jul 81.** Dadiani, J. (TRW Energy Engineering Div., McLean, VA (USA)). Feb 1984. 81p. NTIS, PC A05/MF A01.

The purpose of this project was to determine the planned cogeneration development by the utility and industrial sectors; to assess the environmental impacts and energy savings from cogeneration; and, to identify potential environmental issues and regulations impacting cogeneration development. Major emphasis was placed on environmental impacts. The study investigated the energy savings and environmental impacts of five industrial facilities which are considering a switch to in-plant cogeneration. Potential regional environmental impacts of cogeneration development in New England, the Tennessee Valley Authority service area and northern New Jersey were also determined. Finally, the environmental impacts of a cogeneration-based district heating system were considered. It was found that there are a number of factors which determine the relative magnitude of environmental impacts of a cogeneration system compared to a conventional energy supply system.

33582 **(PB—84-165455) Rationalization of energy use in future Colombian buildings.** Suarez, A.V. (Universidad de Los Andes, Bogota (Colombia). Centro de Estudios e Investigacion). 1982. 43p. (In Spanish). (I—1). NTIS, PC A03/MF A01.

This study on the rationalization of energy use in Colombia begins with some standards of energy consumption in the United States and presents some aspects of the relationship between engineering and architecture there. It then reviews the work on this subject which has been done in Colombia, and points out areas where work needs to be done. It also indicates some aspects which should be analyzed and regulated concerning design and construction. The report then shows a practical example of rationalizing energy use in a Bogotan residence.

33583 **Measuring the benefits and costs of utility conservation and load-management programs.** Hirst, E. (Oak Ridge National Lab., TN). *Energy Policy;* **12**: No. 2, 219-220(Jun 1984). (CONF-8311175—).

From 95. annual convention and regulatory symposium of the National Association of Regulatory Utility Commissioners (NARUC); Detroit, MI, USA (14 Nov 1983).

Much less has been learned than could have been from utility operation of conservation and load management programs. This general ignorance concerning the performance (i.e., benefits and costs) of these programs exists because the authors have not devot-

ed sufficient resources to careful evaluations of past and present programs. The authors need to build evaluation into the program planning and implementation process, and the authors should use actual electricity and gas bills to measure program performance. Finally, the authors should conduct well designed experiments to learn what does and does not work.

33584 **(DOE/CS/10308—T1) Hispanic business community participation in conservation and solar energy. Final report.** (Latin American Manufacturers Association, Washington, DC (USA)). 1984. Contract FG01-80CS10308. 51p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013688.

Portions are illegible in microfiche products.

This report summarizes the accomplishments made by the Latin American Manufacturers Association (LAMA) in a effort to promote the research, development, and commercialization of energy technologies supported by the DOE Conservation and Solar Applications (CSA) Division. Activities included the identification of Hispanic manufacturing and technical firms with energy-related capabilities, the dissemination of information to the Hispanic business community regarding DOE/CSA activities, and a pilot marketing effort designed to enhance Hispanic business involvement in the procurement activity of CSA-funded organization.

33585 **(DOE/RG/10063—T2) Summary of interview survey of electric utility communication specialists.** Ludwig, S.; Messe, L.A.; Crano, W.D. (Michigan State Univ., East Lansing (USA). Center for Evaluation and Assessment). 11 Nov 1980. Contract FG01-79RG10063. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013296.

Portions are illegible in microfiche products.

The survey yielded a great deal of useful information. It provided the staff members of the Center for Evaluation and Assessment with a focus for their efforts with regard to developing guidelines and mechanisms for effective communication between electric utilities and their customers. Moreover, the interviews confirmed the staff's initial judgment that there are substantial problems that must be overcome if communication programs are to be effective; at the same time, these conversations with communication specialists in the utility industry reinforced a sense that these issues must be addressed, since effective, open communication has to be a key component in any comprehensive attack on large-scale energy related problems.

33586 **(AD-A—137492/5) Preliminary assessment of a rotary detonation engine concept. Master's thesis.** Monks, S.A. (Naval Postgraduate School, Monterey, CA (USA)). Sep 1983. 114p. NTIS, PC A06/MF A01.

Results of a preliminary, experimental assessment of a rotary detonation engine concept are reported. Measurements were taken of the torque produced by a stationary rotor model as a result of a single detonation process initiated within the rotor under known premixed gas conditions. Mixtures of ethylene and oxygen and ethylene and oxygen with three moles of nitrogen ballast were utilized. The results represent the lower bound to values of torque produced by the rotor model. Modifications of the instrumentation and torque measurement system are recommended to allow the transient process and resulting torque to be measured in greater detail, a comparison to be made with the results of numerical modeling, and a definitive assessment of the potential of the concept to be concluded.

33587 **(AD-A—139457/6) Thermal energy recovery in gas turbine engine test cells. Final report Oct 82-Sep 83.** Kodres, C.A. (Naval Civil Engineering Lab., Port Hueneme, CA (USA)). Nov 1983. 112p. (NCEL-TN—1679). NTIS, PC A06/MF A01.

The economics of thermal energy recovery in jet engine test cells is examined. A numerical model to simulate the test cell augmenter tube is developed. This model is employed to determine the feasibility of installing heat exchangers along the augmenter or at the augmenter exit and using these heat exchangers to generate steam or electricity from the thermal energy in the jet exhaust. In general, energy recovery is not practical. The exhaust is quickly diluted by the entrained augmentation air, decreasing temperature gradients necessary for heat transfer. Most test cells are used too infrequently to warrant the cost of the hardware.

33588 **(AD-A—953090/8) 3 kw closed Rankine-cycle powerplant. Final report 19 May 66-31 Mar 73.** Teagan, W.P.; Morgan, D.T. (Thermo Electron Corp., Waltham, MA (USA)). Jun 1973. 290p. (TE—5092-99-72). NTIS, PC A13/MF A01.

33589 **(BMFT-FB-T—84-006) Development of high temperature ceramic parts for vehicular gasturbines.** Huehter, W.; Krueger, W. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.); Motoren- und Turbinen-Union G.m.b.H., Muenchen (Germany, F.R.)). Jan 1984. 70p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751277.

Portions are illegible in microfiche products.

In the second three-years program, ceramic components for a truck gas turbine were designed and tested. A combustion chamber variant of SiC + Si survived a running time of 22.3 hours without damage under pressure conditions with cyclic load. The inlet cone of fabricated design remained free of cracks in all test runs. Stator variaties were tested at 1650 K. No damage occurred in stator segments. Integral stators had cracked shrouds. Tests under operation pressure are being prepared. The turbine disc concept - metallic disc with set-in ceramic blades - of the first ceramic program was modified following a reconsideration of construction data. HPSN blade dummies have survived 5000 load cycles from 0 to 465 m/s circumferential speed with reference to the blade central cross section (construction datum 387 m/s) without damage in the cold spin test. Blades of HPSN and RBSN were tested in the hot spin test (maximum gas temperature 1470 K). Material characteristics were established for the ceramic sorts - HPSN, RBSN, SiC + C - used at present. Methods for processing the ceramics were further developed. Main features were ultrasonic countersinking and shape-grinding.

33590 **(DOE/NASA/50194—39) Cold-air performance of compressor-drive turbine of Department of Energy upgraded automobile gas turbine engine. III. Performance of redesigned turbine.** Roelke, R.J.; Haas, J.E. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). May 1984. Contract AI01-80CS50194. 39p. (NASA-TM—83627). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013664.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The aerodynamic performance of a redesigned compressor-drive turbine of the Department of Energy Upgraded Gas Turbine engine was determined in air at nominal inlet conditions of 325 K and 0.8 bar absolute. The turbine was designed with a lower flow factor, higher rotor reaction and a redesigned inlet volute compared to the first turbine. Comparisons between this turbine and the originally designed turbine showed about 2.3 percentage points improvement in efficiency at the same rotor tip clearance. Two versions of the same rotor were tested: an as-cast rotor and the same rotor with reduced surface roughness. The effect of reducing surface roughness was about one-half percentage point improvement in efficiency. Tests made to determine the effect of Reynolds number on the turbine performance showed no effect for the range from 100,000 to 500,000.

33591 **(PB—84-164243) Influence of cool engines on car fuel consumption. Supplementary report.** Armstrong, B.D. (Transport and Road Research Lab., Crowthorne (UK)). 1983. 12p. (TRRL-SUPPLEMENTARY—822). NTIS, PC E03/MF E03.

The report concludes that the extra fuel used, because engines are not fully warm at all times, is roughly one third of the present national consumption by cars. A national sample of car diaries, collected with the National Travel Survey in 1978-79, has made it possible to make a new estimate of the effect of cool engines on fuel consumption. For the first time it has been possible to make a detailed allowance for the effect of trips which start with the engine already warm. (Copyright (c) Crown Copyright 1983.)

33592 **(VW-FMT—8208-V/5) Development of probes for measuring fuel and air flow as well as fuel remaining in production automobiles.** (Volkswagenwerk A.G., Wolfsburg (Germany, F.R.). Abt. Forschung und Entwicklung). 13 Sep 1982. 86p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751282.

Portions are illegible in microfiche products.

This survey is also subject matter of the report of a research project promoted by the Federal Ministry of research and development under the title: Development of probes for measuring fuel and air flow as well as fuel remaining in production automobiles. Fuel flow measuring methods according to thermal, hydrometric vane and correlation principles were tested. Based on these results, probes qualified for automobiles were developed. For probes according to the thermal principle, solutions were found to prevent thermal and hydrodynamic interference. For the hydrometric vane one of the goals achieved was a considerable measuring margin decrease. As far the correlation probe, principles for promising solutions were found. Optical and electrical methods were used to examine and clarify the physical mechanism of the conventional rotational flow method. A miniature probe for air flow was developed according to this method. Various methods for the determination of fuel remaining were analysed. This included comprehensive studies on a method using both level and consumption measurement methods. This way small quantities of fuel remaining in a automobile in motion can be determined more accurately than by the conventional float-controlled measurement.

33593 **(CONF-840804—13) SEAMOPT - Stirling engine optimization code.** Heames, T.J.; Daley, J.G. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012098.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

Experience is described with use of a fast-running Stirling engine optimization code developed at Argonne intended for public release. Stirling engine modeling is provided by the SEAM1 thermodynamic code. An interface was written to combine SEAM1 with a general optimization code and assess maximum component stress levels. Thus full engine thermodynamic and structural simulation is done during the optimization process. Several examples of the use of this code to optimize the GPU-3 engine are described. In one case efficiency was improved by over 25%.

33594 **(DOE/NASA—1005-3) Comparison of free-piston Stirling engine model predictions with RE1000 engine test data.** Tew, R.C. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1984. Contract AI05-82OR21005. 19p. (CONF-840804—10; NASA-TM—83650). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011501.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Predictions of a free-piston Stirling engine model are compared with RE1000 Sunpower engine test data taken at NASA-Lewis Research Center. A kinematic code was upgraded to permit simulation of free-piston engine performance; it was further upgraded and modified and is currently being validated. The model predicts engine performance by numerical integration of equations for each control volume in the working space. Piston motions are determined by numerical integration of the force balance on each piston or can be specified as Fourier series. In addition, the model Fourier analyzes the various piston forces to permit the construction of phasor force diagrams. The paper compares predicted and experimental values of power and efficiency and shows phasor force diagrams for the RE1000 engine displacer and piston. Further development plans for the model are also discussed.

33595 **(DOE/NASA—51040-55) Creep-rupture behavior of candidate Stirling engine alloys after long-term aging at 760°C in low-pressure hydrogen.** Titran, R.H. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). May 1984. Contract AI01-77CS51040. 43p. (NASA-TM—83676). NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013537.

Nine candidate Stirling automotive engine alloys were aged at 760°C for 3500 h in low pressure hydrogen or argon to determine the resulting effects on mechanical behavior. Candidate heater head tube alloys were CG-27, W545, 12RN72, INCONEL-718, and HS-188 while candidate cast cylinder-regenerator housing alloys were SA-F11, CRM-6D, XF-818, and HS-31. Aging per se is detrimental to the creep-rupture and tensile strengths of the iron-base alloys. The presence of hydrogen does not significantly contribute to strength degradation. Based on current MOD 1A Stirling engine design criteria of a 55% urban - 45% highway driving cycle; CG-27 has adequate 3500 h - 87°C creep-rupture strength and SA-F11, CRM-6D, and XF-818 have adequate 3500 h - 775°C creep-rupture strength.

33596 **(ORNL/CON—154) Nonlinear analysis of Stirling engine thermodynamics.** Banduric, R.D.; Chen, N.C.J. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 76p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84013493.

Numerical solutions to a simplified mathematical formulation for Stirling engine thermodynamics, including some major loss mechanisms and their interactions, are presented. The objective is to provide numerically accurate solutions to the nonlinear equations for verification of a simplified linear analysis recently developed at Oak Ridge National Laboratory. At this stage, the formulation requires that the piston motions be specified; that is, it does not include the dynamics of free pistons. The equations of the formulation were numerically solved, with no further simplifications, using a standard IBM software package, called the Continous System Modeling Program, that basically involves numerical integration. The results were used to show the effects of four major loss mechanisms on the performance parameters of the RE-1000 free-piston Stirling engine. These losses are: adiabatic cylinder effects, transient heat transfer, pressure drop, and seal leakage. The performance parameters calculated were power output and efficiency. Some discussion of the results and a further analysis of this engine model are also presented.

3303 Electric-powered Systems

33597 **(AD-A—139719/9) Electric vehicle modeling and simulation. Technical report.** DeWispelare, A.R. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Aug 1983. 80p. NTIS, PC A05/MF A01.

The forecasting of the performance of electric vehicles has revealed many discrepancies when compared to actual test data. An electric vehicle computer simulation program was developed to ameliorate this deficiency. The approach was to establish a very comprehensive and flexible vehicle model and simulate its operation on a realistic driving cycle. The driving cycle selected was the Federal Urban Driving Sequence. A thorough vehicle model was established that incorporate aerodynamic drag, rolling asistance, both rotational and translational inertial effects, and component by component dynamic power train efficiencies. Battery discharge per-

formance is tracked by a fractional-utilization algorithm with corrections for short-term discharge effects. The simulation compares required power obtained from the driving cycle speed schedule and vehicle model characteristics with the available power at the motor for each time increment of the driving cycle to compute battery fraction used and deviation from the speed schedule when available power is insufficient. These results of the simulation can be used to evaluate an existing vehicle's performance or, if desired, to develop vehicle parameters to obtain a specified performance level. An application of the program to develop a suburban passenger vehicle is included to demonstrate the simulation's utility. A test bed vehicle was constructed and tested to verify the simulation. Additional aspects such as microprocessor based controllers including implementation of an optimal control law were investigated to gain insite into the efficiency and performance trade-offs of such a system.

33598 **(AD-A—140123/1) Testing and evaluation of jet electric vehicle models: 600, 1000, and 1000p. Final report FY 80-FY 83.** Mekari, M.H. (Army Tank-Automotive Command, Warren, MI (USA)). 29 Feb 1984. 44p. (TACOM-TR—4331). NTIS, PC A03/MF A01.

The major purpose of this program is to test the performance and the economy of contemporary electric vehicle versus conventional internal combustion engine vehicle for delivery type industrial applications. The test data of these three different types of vehicles, compared to similar conventional internal combustions engine vehicles, operated at same locations and conditions, show that conventional vehicles have advantages over the electric vehicles and that: total electric vehicle maintenance and energy cost is 58 cents/mile; and Total internal combustion engine vehicle maintenance and energy cost is 24 cents/mile. Other advantages and disadvantages are stated in the Conclusions paragraph of this report.

33599 **(CONF-840804—14) Computerized system for establishing electric-vehicle battery requirements.** Marr, W.W.; Walsh, W.J. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011728.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

This paper describes a computerized system for establishing performance requirements for electric vehicle batteries. This system, called EVA (Electric Vehicle Analysis), enables least-cost analyses to identify optimum battery characteristics for different vehicle types and missions. EVA incorporates various computational and modeling features from previous electric-vehicle analyses. It is a user-friendly, interactive software package that allows optimization of complex battery systems with relative ease.

33600 **(NP—4770264) Technical and economic aspects of design and use of electric passenger vehicles.** Bucher, W. (Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany, F.R.)). Jul 1982. 299p. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number DE84770264.

Portions are illegible in microfiche products.

The study investigates in how far vehicles with electric drive can be realised with todays state of development and whether they can be used when considering the present demand of use. Battery-driven electric passenger cars are in the centre of interest as they show the technical problems most distinctively. These problems are tackled in the following steps - description of the state of technology and the expected progress concerning components of the electric road vehicle; - considerations of energy and economy of the electric vehicle; - comparison of the driving performance of electric vehicles and conventional passenger cars; - comparison between battery-driven electric vehicles and fuel-cell driven vehicles and vehicles with hybrid drive; - questions of infrastructure (power generation and -distribution for electric vehicles).

33611 **(AD-A—137312/5) After-test engine inspection of U.S. Army administrative and light-tactical vehicles operated on gasohol and unleaded gasoline. Interim report Oct 81-Feb 83.** Butler, W.E. Jr.; Frame, E.A.; Owens, E.C. (Southwest Research Inst., San Antonio, TX (USA). Army Fuels and Lubricants Research Lab.). Feb 1983. 125p. (AFLRL—167; SWRI—6800-210/1). NTIS, PC A06/MF A01.

Eighteen spark ignition engines from U.S. Army administrative and light-tactical vehicles, which were part of a fleet test to determine the effects of operating such engines with gasohol as a fuel, were shipped to the U.S. Army Fuels and Lubricants Research Laboratory (USAFLRL) for after-test inspections. Twelve of the engines were operated with gasohol as a fuel, and six of the engines were operated with unleaded gasoline. Each engine was disassembled for inspections which included visual inspection, wear measurements of selected components, deposit ratings in accordance with CRC rating methods, and photographs of selected parts. No significant differences between engines operated with gasohol and those operated with unleaded gasoline could be determined by any of the inspection methods used. Consideration of the data generated from the inspections support the conclusion that gasohol may be successfully utilized in the U.S. Army's administrative and light-tactical vehicles.

33612 **(AD-A—139865/0) Fuel-resistant coating and binders for porous friction surface pavements: tests and analyses. Final report May 80-Nov 83.** Shoenberger, J.S. (Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Geotechnical Lab.). Feb 1984. 66p. NTIS, PC A04/MF A01.

This report documents research to evaluate the ability of several products to render porous friction surfaces (PFS) resistant to damage from jet fuel and hydraulic fluid spillage. Test procedures and requirements used to select fuel-resistant binders and coatings for field trials are presented in detail. One field trial using one of the products found successful in the lab, Koppers RT14, was conducted with promising results.

33613 (INIS-BR—119, pp 117-118) **Radiocrystallographic study of rare minerals Leadhillita and Susannita.** Baptista, A. (Instituto de Engenharia Nuclear, Rio de Janeiro (Brazil)). 1981. (In Portuguese). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84780333.

33614 **(SAND—83-2332C) Numerical modeling of the drying of porous materials.** Hadley, G.R. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 9p. (CONF-840750—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013056.

From 4. international drying symposium; Kyoto, Japan (9 Jul 1984).

A numerical solution technique has been presented which solves in one dimension the coupled heat and mass flow equations for water, water vapor, and an inert gas moving through a porous medium. The physical effects included in the resulting computer program PETROS are more complete than for previous simulations, particularly for the gas phase transport. The latter includes effects due to binary gaseous diffusion and Knudsen diffusion as well as Darcy flow. PETROS is thus capable of simulating two-phase flow through porous media.

33615 **(UCID—18574-83-4) H Division. Materials Physics quarterly report, October-December 1983.** Moriarty J.A. (ed.). (Lawrence Livermore National Lab., CA (USA)). 13 Apr 1984. Contract W-7405-ENG-48. 60p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013206.

Portions are illegible in microfiche products.

Reported are: equation-of-state (EOS) experiments on aluminum; static EOS work on uranium using ultra-high pressure diamond anvil apparatus; free-electron behavior and the friedel sum (for Cu and Al); theory of interatomic potentials in transition metals; a new, thermodynamically consistent, hybrid-integral equation for fluids and plasmas; second-order theory of spectral line shifts; electric microfield distribution at strong coupling and high temperature electron screening; shock amplified flow instability simulations; noninteractive and interactive simulations of compliant surface response; and homogeneous period heat flow via nonequilibrium molecular dynamics.

33616 **The thermal conductivity of semitransparent materials.** Fine, H.A.; Jury, S.H.; McElroy, D.L.; Yarbrough, D.W. (Dept. of Metallurgical Eng. & Materials Science Univ. of Kentucky Lexington, KY). pp 359-368 of Thermal conductivity. Vol. 17. Hust, J.G. New York, NY; Plenum Publishing Corp. (1983). (CONF-8106164—). Contract W-7405-ENG-26.

From National Bureau of Standards joint conferences: 8. symposium on thermophysical properties; 17. thermal conductivity conference; 8. thermal expansion conference; Gaithersburg, MD, USA (15 Jun 1981).

This chapter uses the three-region approximate solution for coupled conductive and radiative heat transfer an exact solution for uncoupled conductive and radiative heat transfer in a grey semitransparent medium bounded by infinite parallel isothermal plates to establish the dependence of the apparent thermal conductivity of semitransparent materials on other material properties and boundary conditions. Demonstrates an application of the analyses, which uses apparent thermal conductivity on temperature. Finds that the predictions for seven sets of R-11 fiberglass and rock wool insulations agree with published measured values to within the limits of experimental error (+ or - 3%). Points out that agreement for three sets of R-19 fiberglass insulations was not good.

33617 **Illustrative numerical comparisons between phonon mean free paths and phonon thermal conductivity.** MacDonald, W.M.; Anderson, A.C. (Dept. of Physics & Materials Research Lab. Univ. of Illinois at Urbana-Champaign Urbana, IL 61801). pp 185-193 of Thermal conductivity. Vol. 17. Hust, J.G. New York, NY; Plenum Publishing Corp. (1983). (CONF-8106164—). Contract AC02-76ER01198.

From National Bureau of Standards joint conferences: 8. symposium on thermophysical properties; 17. thermal conductivity conference; 8. thermal expansion conference; Gaithersburg, MD, USA (15 Jun 1981).

This chapter discusses the phonon thermal conductivity of a solid, and attempts to show the relationship with phonon mean free path. Points out that measurements of thermal conductivity are often used as an interrogative technique to learn about phonon scattering processes in solids. Examines the effects on thermal conductivity of anisotropy and of non-constant phonon mean free path while retaining the assumption of low temperature. Concludes that since there is no fast and reliable experimental method of inserting monochromatic phonons, having a frequency range of 1 GHz to 1 THz, into a variety of materials, it is likely that thermal conductivity measurements will continue to provide an important source of information on phonon scattering.

33618 **Application of parameter estimation techniques to thermal conductivity probe data reduction.** Koski, J.A.; McVey, D.F. (Sandia National Lab. Albuquerque, NM 87185). pp 587-600 of Thermal conductivity. Vol. 17. Hust, J.G. New York, NY; Plenum Publishing Corp. (1983). (CONF-8106164—). Contract AC04-76DP00789.

From National Bureau of Standards joint conferences: 8. symposium on thermophysical properties; 17. thermal conductivity

conference; 8. thermal expansion conference; Gaithersburg, MD, USA (15 Jun 1981).

This chapter uses parameter estimation techniques to determine thermal conductivity from line heat source probe data. Describes a data reduction method that utilizes experimental temperature data at both early and late times, does not require full development of the classical linear temperature increase vs. logtime asymptotic behavior, is not as sensitive to data noise as other techniques, and permits evaluation of the experiment design and data assumptions through statistical analysis of final residuals (difference between the analytical solution and experimental data). Explains that the approach consists of obtaining a nonlinear least-squares fit between an analytical solution containing the parameters of interest (conductivity, contact resistance, and, in some cases, density-specific heat product) and experimental data. Examines sensitivity coefficients (derivatives of the parameters with respect to the measured variable) and demonstrates the adequacy of thermal conductivity as a fit parameter. Applies the method to analysis of laboratory and in situ field data.

3601 Metals And Alloys

REFER ALSO TO CITATION(S) 32504, 32669, 32711, 32780, 32781, 32920, 32921, 32922, 32928, 32931, 33181, 33182, 33183, 33186, 33186, 33200, 33204, 33205, 33207, 33207, 33208, 33208, 33209, 33228, 33595, 33806, 33818, 33859, 33868, 33937, 34560, 34777

33619 (AD-A—138581/4) Clarifiction of environmental effects in stress corrosion cracking. Final report 1 Jun 75-31 Dec 83. Foley, R.T. (American Univ., Washington, DC). Jan 1984. 26p. NTIS, PC A03/MF A01.

The objective of this project was to clarify the role of the environment in the stress corrosion cracking and the localized corrosion of aluminum alloys. Specifically, the project addressed the manner in which different chemical species, such as various anions, are involved in the corrosion process.

33620 (AD-A—139086/3) Corrosion control through a better understanding of the metallic substrate/organic coating/interface. Annual report No. 4, 1 Sep 82-30 Sep 83. Leidheiser, H. Jr.; Allen, E.M.; El-Aasser, M.S.; Fowkes, F.M.; Granata, R.D. (Lehigh Univ., Bethlehem, PA (USA). Center for Surface and Coatings Research). 1 Jan 1984. 248p. NTIS, PC A11/MF A01.

This report represents the fourth annual summary of research carried out under Office of Naval Research. The objective of this research is to obtain a better understanding of the metallic substrate/organic coating/interface system so that improvements may be made in corrosion control of metals by painting. The report this year includes a summary of progress made in 16 different components of the program. These activities are arranged for convenience into those primarily concerned with (a) corrosion at the interface, (b) the chemistry of the metal/coating interface, (c) the properties of the coating, (d) the properties of iron oxides with particular relevance to the painting of rusted steel.

33621 (AD-A—139649/8) Fracture behavior of a uranium and a tungsten alloy in a notched component with inertia loading. Final report. Underwood, J.H.; Scavullo, M.A. (Army Armament Research and Development Command, Watervliet, NY (USA). Large Caliber Weapon Systems Lab.). Dec 1983. 36p. (ARLCB-TR—83043). NTIS, PC A03/MF A01.

Presented at the National Symposium on Fracture Mechanics (16th), ASTM, Columbus, Ohio, 15-18 Aug 83.

A failure of a prototype long rod penetrator is described, including the stress and fracture analyses performed, the materials and service simulation testing performed, and the fracture toughness and nondestructive inspection requirements which were implemented. Results of a subsequent study are described, which involve the producibility of the long rod penetrator, particularly in relation to the complex fracture toughness testing methods which are required for use with this component.

33622 (BMFT-FB-T—84-007) Manufacturing and properties of aluminium sheet from mixed scrap materials. Lossack, E. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.); Vereinigte Aluminium-Werke A.G., Bonn (Germany, F.R.). Leichtmetall-Forschungsinstitut). Jan 1984. 69p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751279.

Portions are illegible in microfiche products.

Mixed old scrap consists of non separable origin foundry alloys and wrought alloys. Melts from such scrap have to be blended with high amounts of primary metal to correct the composition for use in usual alloy fields. The investigation had to find out if mixed old(qcrap could belused for sheet manufacuuring without blending with primary metal at great extent. Two model compositions were chosen which refered to possible scrap mixtures. By d.c. casting into slabs, hot rolling and cold rolling sheet can be manufactured. In selected tempers this uncommon sheet showed good strength and formability properties. The existing corrosion problems with the sheet can be solved by suitable coating or preferably by cladding with selected clad alloys.

33623 (BNL—34778) Anodic processes and the kinetics of stress-corrosion cracking or corrosion fatigue. Newman, R.C. (Brookhaven National Lab., Upton, NY (USA)). 1983. Contract AC02-76CH00016. 14p. (CONF-8310205—10). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012911.

From TMS-AIME fall meeting; Philadelphia, PA, USA (2 Oct 1983).

Transient electrochemical measurements on film-free metal surfaces have often been used to test models of environment-assisted crack growth. The history of these attempts is reviewed, and the results are assessed in the light of what we now know about mechanisms of stress-corrosion cracking and corrosion fatigue. 98 references.

33624 (CEA-R—5242) Positron annihilation technique applied to the study of inhomogeneous solids: aluminium alloys, layered compound 1T-TaS_2. Boileau, F. (Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). 1983. 151p. (In French). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84751569.

Portions are illegible in microfiche products.

This thesis is an experimental investigation of inhomogeneous solids using the standard positron annihilation techniques (angular correlation of annihilation γ-rays, Doppler broadening, lifetime). The investigations are concerned with different types of more or less extended defects. The effect of impurities on the migration properties of the vacancy-type defects is first studied in electron irradiated and quenched aluminium alloys. The affinity of the positron for precipitates formed in supersatured aluminium alloys is shown experimentally and explained. The effects of low dimensionality on the behaviour of the positron are then studied in the layered dichalcogenide 1T-TaS_2 where the presence of charge density waves modifies the electronic properties. An experimental and theoretical insight on the Fermi surface of this compound has been successfully undertaken.

33625 (CONF-840520—9) Sputtering properties of copper-lithium alloys at reactor-level temperatures and surface erosion rates. Krauss, A.R.; Gruen, D.M.; Lam, N.Q.; DeWald, A.B. (Argonne National Lab., IL (USA); Georgia Inst. of Tech., Atlanta (USA)). 1984. Contract W-31-109-ENG-38. 23p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013425.

From 6. international conference on plasma surface interactions in controlled fusion devices; Nagoya, Japan (14 May 1984).

Portions are illegible in microfiche products.

Previous experiments on copper-lithium alloys at temperatures up to 250°C and with erosion rates of .01 to .1 monolayer per second have shown that in the electric and magnetic field environment of a magnetic-confinement fusion reactor, it is possible to maintain a lithium overlayer which will significantly reduce the copper erosion rate. We have extended these experiments to the reactor-relevant regime of 350 to 400°C, with erosion rates approach-

ing one monolayer per second. By comparison with the lower flux experiments, it is found that radiation damage effects start to dominate both the surface concentration and depth profile of the lithium. The subsurface region of enhanced lithium concentration is broadened, while the surface concentration is not depleted as rapidly per incident ion as in the low flux case. The time-dependent lithium depth profile is calculated using a computer code developed at Argonne which includes both Gibbsian segregation and radiation-induced effects. The experimental results are compared with these calculations. It is found that the sputtering behavior of the copper-lithium alloy is highly dependent on the mass and energy spectrum of the incident particles, the sample temperature, subsurface structure, and the partial sputtering yields of the alloy components.

33626 **(CONF-840604—7) Nonequilibrium segregation and phase instability in alloy films during elevated-temperature irradiation in a high-voltage electron microscope.** Lam, N.Q.; Okamoto, P.R. (Argonne National Lab., IL (USA)). May 1984. Contract W-31-109-ENG-38. 37p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013423.

From 12. international symposium on effects of radiation on materials; Williamsburg, VA, USA (18 Jun 1984).

Portions are illegible in microfiche products.

The effects of defect-production rate gradients, caused by the radial nonuniformity in the electron flux distribution, on solute segregation and phase stability in alloy films undergoing high-voltage electron-microscope (HVEM) irradiation at high temperatures are assessed. Two-dimensional (axially symmetric) compositional redistributions were calculated, taking into account both axial and transverse radial defect fluxes. It was found that when highly focused beams were employed radiation-induced segregation consisted of two stages: dominant axial segregation at the film surfaces at short irradiation times and competitive radial segregation at longer times. The average alloy composition within the irradiated region could differ greatly from that irradiated with a uniform beam, because of the additional atom transport from or to the region surrounding the irradiated zone under the influence of radial fluxes. As a result, damage-rate gradient effects must be taken into account when interpreting in-situ HVEM observations of segregation-induced phase instabilities. The theoretical predictions are compared with experimental observations of the temporal and spatial dependence of segregation-induced precipitation in thin films of Ni-Al, Ni-Ge and Ni-Si solid solutions.

33627 **(CONF-840842—15) Absence of magnetic field dependence of the cyclotron effective masses in Pd.** Joss, W.; Hall, L.N.; Crabtree, G.W.; Vuillemin, J.J. (Eidgenoessische Technische Hochschule, Zurich (Switzerland). Lab. fuer Festkoerperphysik; Argonne National Lab., IL (USA); Arizona Univ., Tucson (USA)). Apr 1984. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011721.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Portions are illegible in microfiche products.

The de Haas-van Alphen effect was used to search for a field dependent many-body enhancement of the cyclotron effective mass in Pd, an effect suggested by the experimentally observed depression of the electronic specific heat by a magnetic field. Several orbits on different sheets of the Fermi surface were studied and showed no field dependence in the mass within experimental error. Furthermore, extensive measurements of the mass on the open hole sheet lead to a KKR-parametrized enhanced density of states which differs from the zero field specific heat value by no more than approximately equal -2% rather than approximately equal -15% as estimated earlier. These measurements imply that the large reduction in the linear term of the specific heat by a magnetic field is not due to a suppression of spin fluctuations, a conclusion supported by more recent specific heat experiments.

33628 **(CONF-840842—18) Lattice vibrational behavior of $SnMo_6S_8$ and oxygen defected $SnMo_6S_{7.8}O_{0.2}$.** Kimball, C.W.; Vaishnava, P.P.; Dunlap, B.D.; Fradin, F.Y.; Hinks, D.G.; Shenoy, G.K. (Northern Illinois Univ., Dekalb (USA). Dept. of Physics; Argonne National Lab., IL (USA)). May 1984. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013453.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Portions are illegible in microfiche products.

The temperature dependence of the Moessbauer effect has been measured at ^{119}Sn sites in oxygen-free, $SnMo_6S_8$ (T/sub c/ = 14.2K) and in oxygen substituted $SnMo_6S_{7.8}O_{0.2}$ (T/sub c/ = 10.1K). The temperature dependence of the asymmetry of the quadrupole doublet for $SnMo_6S_8$ shows phonon anomalies near 50 and 120K. $<z^2>$ /sub T/ indicates contraction with increasing temperature between 4.3 and 50K. For the oxygen substituted compound a study of the variation of mean square displacement with temperature shows lattice softening near 120K.

33629 **(CONF-840842—20) Lattice vibrational behavior of the exchange enhanced superconductor U_6Fe.** Vaishnava, P.P.; Kimball, C.W.; Strelecky, C.A.; Dwight, A.E.; Fradin, F.Y. (Northern Illinois Univ., Dekalb (USA). Dept. of Physics; Argonne National Lab., IL (USA)). May 1984. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013419.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Portions are illegible in microfiche products.

The temperature dependence of the Moessbauer effect has been studied at ^{57}Fe nuclei in the exchange-enhanced superconductor U_6Fe (T/sub c/ = 3.76+-0.17K). The nonharmonic variation in shift vs temperature is interpreted as due to changes in electronic structure below 100K. Phonon hardening below 100K is also inferred from the temperature dependence of the Debye-Waller factor.

33630 (DOE/ER—0113/3, pp 53-58) **Magnetoresistivity of copper irradiated at 4.4 K by spallation neutrons.** Klabunde, C.E.; Coltman, R.R. Jr. (Oak Ridge National Lab., TN). May 1984. NTIS, PC A04/MF A01. Order Number TI84011825.

In Sixth annual progress report on special purpose materials for magnetically confined fusion reactors.

An experiment assembly containing eight differently prepared copper stabilizer specimens was irradiated in the ANL/IPNS-I Radiation Effects Facility. Magnetoresistivity measurements were made on each sample at zero and nine transverse magnetic field strength values up to 6.5 Tesla at each step over three irradiation (4.4 K) and annealing (300 K) cycles. The total neutron fluence was $4.8 \times 10^{21} n/m^2$ ($E > 0.1$ MeV). The results show a strong dependence upon sample purity and state of cold-work. The data from this experiment will be added to a growing body of data to be used in the design of composite superconductors for fusion magnets.

33631 **(DOE/ER/05951—4) Combined thermodynamic study of nickel-base alloys. Final report.** Brooks, C.R. (Tennessee Univ., Knoxville (USA). Dept. of Chemical, Metallurgical and Polymer Engineering). Aug 1983. Contract AS05-78ER05951. 39p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013467.

Portions are illegible in microfiche products.

A method of making a high temperature, solid electrolyte was developed, and success was achieved in emf measurements on some Ni-Mo and Ni-Mo-Cr alloys. Measurements of the heat capacity of Ni_4Mo from 300 to 1100°K were made, and the construction and testing of a low temperature calorimeter was completed. A computer program to calculate binary phase diagrams from thermodynamic data was written and utilized in analyzing some systems. 13 figures, 6 tables.

33632 (DOE/ER/06035—6) Supersonic metal cluster beams. Technical progress report, March 16, 1983-March 15, 1984. Smalley, R.E. (Rice Univ., Houston, TX (USA)). 1984. Contract AS05-78ER06035. 27p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012976.

Portions are illegible in microfiche products.

Recent developments in laser and molecular beam technology have now made it possible to produce supersonic beams of metal clusters of virtually any metal in the periodic table. Initially, studies have involved the investigation of the metal-metal bond in transition metal dimers, including Cr_2, Mo_2, V_2, and Ni_2 through resonant two-photon ionization spectroscopy. These studies have demonstrated the importance of 3d (and 4d) electrons in the metal-metal bond in Cr_2, Mo_2, and V_2. A comparison of V_2 and Cr_2 illustrates the importance of the 3d contraction with increasing nuclear charge, and this is found to be of central concern in No_2, where no 3d contribution to the chemical bond is found. Finally, Cu_3 is investigated, providing the first gas-phase spectrum of a triatomic transition metal cluster. Electronically, Cu_3 is analogous to Na_3 and other alkali trimers, so it is not surprising that the observed spectrum is best explained as arising from a Jahn-Teller distorted $^2E'$ state (in D/sub 3h/ symmetry), as has been calculated for Li_3. The observed transition in Cu_3 is assigned to be $^2E''$ reverse arrow $^2E'$, with both upper and lower states undergoing Jahn-Teller distortions.

33633 (DOE/ER/10897—3) Metallic glasses as new catalyst systems for energy conversion. Annual progress report and final technical report. Brower, W.E. Jr.; Smith, G.V. (Southern Illinois Univ., Carbondale (USA)). 31 May 1984. Contract AC02-81ER10897. 13p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013697.

Splat cooled Pd_{80} Si_{20} surfaces are atomically rough and are rich in highly uncoordinated sites approximating kinks in crystalline materials. These sites are only partly destroyed by thermal aging, are not destroyed by cyclic aging in hydrogen, and do not form a β-Pd-hydride phase. Apparently Si imparts to Pd a high resistance towards surface reconstruction, while allowing it to continue to function as Pd in the catalytic sense. Splat cooled $Fe_{80}B_{20}$ can be made glassy, but a sample of Metglas (Allied Chemical $Fe_{80}B_{20}$ No. 2605) was only partly glassy and crystallized at a lower temperature than the shock tube splat cooled glass. These findings are supported by physical, theoretical, and chemical techniques. Physical techniques include x-ray photoelectron spectroscopy, Moessbauer Spectroscopy, and differential scanning calorimetry. Theoretical techniques include surface structural modelling and heat and fluid flow modelling during splat cooling. Chemical techniques include chemisorption of H_2, O_2, and CO as well as the catalytic reactions of alkene and alkyne molecular probes. One of these reactions is the isomerization and hydrogenation of (+)-apopinene.

33634 (EPRI-NP—3483) Fractographic evaluation of specimens of A533B pressure vessel steel. Final report. Toerroenen, K.; Kemppainen, M.; Haenninen, H. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). May 1984. 183p. EPRI-Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920383.

This report presents the results of a fractographic evaluation of the specimens from a testing round-robin of environment assisted cyclic crack growth in A533B reactor pressure vessel steel. Results demonstrate that the fracture morphology changes to a brittle-like appearance whenever a significant enhancement of the crack growth rate occurs. It is also shown that manganese sulfide inclusions have a definite role in the environment assisted crack growth process.

33635 (HEDL—7444) Fundamental alloy studies. Brager, H.R.; Garner, F.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 02 Jul 1984. Contract AC06-76FF02170. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013941.

Portions are illegible in microfiche products.

A series of four alloy groups have been produced to investigate the origin of swelling and creep resistance in the Fe-Ni-Cr austenitic system and also to explore the possible existence of a high swelling resistance in the corresponding Fe-Cr-Mn austenitic system. This extension is based on a correlation observed between swelling resistance and the analomous property regime commonly referred to as the Invar regime. Many of these alloys have recently been included in irradiation experiments conducted in EBR-II, HFIR and FFTF.

33636 (HEDL—7451) Effective thermophysical and elastic properties of materials with voids. Wolfer, W.G.; Garner, F.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 02 Jul 1984. Contract AC06-76FF02170. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013942.

Portions are illegible in microfiche products.

The current theories describing the influence of void swelling on conductive and elastic properties have been reviewed and compared with the limited data available. Judgements have been made as to the most appropriate equations to describe the influence of voidage on thermal and electrical conductivity, and also the shear, bulk and Young's moduli and Poisson's ratio. These equations will be included in the Fusion Materials Handbook.

33637 (HMI-B—390) Computeraided measurement of electric resistances of metals irradiated with electrons. Poerschke, R.; Herdam, G. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.). Bereich Datenverarbeitung und Elektronik). Mar 1983. 49p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751494.

The measurement of electric resistances of metals and alloys before, during and after irradiation with electrons of high energy is controlled by a CAMAC-processor in a stand-alone measurement instrumentation system. The chosen measurement procedure permits a relative exactness of the resistance values 10^{-5} by reversing the polarity of the measurement current and performing series measurements with positive and negative direction of current. During irradiation, the development of the resistance values is plotted on the terminal. All measurement results and all intermediate values are recorded on a tape of a connected DECtape II for later evaluation.

The aim of this study was to reproduce the surface topography of metals at cyclic loads as well as its variation with time by means of modern methods and to investigate it. Particular attention was given to the statistical support of the quantitative results by sufficiently large samples. This requires the development of preparation methods that are simple and can be quickly carried out. The material chosen was copper, because a particularly extended information background is available there. (orig./RW).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

The testing of susceptibility of steel to hot tears was carried out by simulation of heat deformation cycles using the Thermorestor-W equipment in the stage of heating and cooling. The mechanical properties of steel were tested after diverse tempering. The susceptibility was tested to cold tears below the weld bead after simulation of cycles of welding and using the technological Tekken and Lehigh tests. High susceptibility was found to hot tears. On the fracture surface of hot tears, excluded eutectic TiX carbides and sulfides were found and in some places nests of $M_{23}D_6$. Maximum plastic properties were attained after heat treatment. The suscepti-

bility to cold tears was only found using one of the test methods. (M.D.).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

Susceptibility to annealing and liquation tears during manual arc welding and submerged arc welding was studied in weld materials 8505, A 324, A 343, MnNiMoCr and Sv10KhMFT. The tests were carried out using the method of simulation of deformation welding cycles. For the evaluation, the isothermal tensile test and the shortened creep test were used. In the study of fracture surfaces of annealing hot tears, the presence was found of Fe_3O_4 and Fe_2O_3 and sulfides. The criteria of crackability for steels are adequate even for weld metals. All studied weld metals were assigned the 2nd degree of susceptibility, i.e., steels susceptible to liquation tears which may be prevented by the observance of prescribed conditions during welding. (M.D.).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

The results are summed up of the evaluation of the mechanical and metallurgical properties of low-carbon stainless martensitic-austenitic steels, alloyed with 13% Cr and 4 to 6% Ni with the addition of molybdenum. Used for the investigation were laboratory melts, rolled and cast and operating melts in form of actual castings. It was found that during optimal treatment it is possible to attain the required resistance to brittle fracture, hydrogen embrittlement and intercrystalline corrosion and the favourable character of the temperature dependence of notch toughness. (M.D.).

33658 (INIS-mf—8929, pp 41-50) **Hydrogen effect on properties of Cr-Mo-V steel.** Splichal, K.; Otruba, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). 1981. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780242. (CONF-8112102—Vol.2).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

Hydrogen embrittlement was studied of Cr-Mo-V steel designed for the manufacture of WWER pressure vessels. Hydrogen embrittlement is manifested at the hydrogen content of over 2.5 ppm by a significant reduction in contraction, ductility, fracture stress, change in the micromechanism of fracture and at a higher content of hydrogen by cracks. Fractographic observations showed that as a result of hydrogen, brittle fracture occurs, the dominant mechanism of the failure is quasi-fission. No effect of neutron irradiation on the mechanism of the fracture was observed. (M.D.).

From Conference on scientific research and production introduction studies of light water reactor power plants; Karlovy Vary, Czechoslovakia (1 Dec 1981).

15Kh2MFA steel with an austenitic CrNi weld deposit was investigated. The threshold values for the development of cracks in the free overlay layer are lower than the values for base steel. Threshold values significantly depend on the parameter of asymmetry of variable strain. The development of fatigue cracks in the overlay metal is several times faster than in base steel, as is the development of the surface crack under the overlay area. Its development accelerates rapidly when the crack penetrates from the base material to the overlay. (M.D.).

In recent measurements of velocity spectra of sputtered atoms using the Doppler-shift laser fluorescence spectrosocopy several problems have been encountered concerning the interpretation of the obtained fluorescence spectra. Essential to the interpretation

of the measured spectra is the knowledge of whether the signal is proportional to the flux or to the density of the sputtered particles in the energy region under consideration. Investigations of this problem at low particle velocities in the thermal energy region are discussed for thermal sodium beams, because in this case the theoretical distribution is well known. It was found that in the low energy region the fluorescence signal is proportional to the flux. Deviations of the measured spectra at energies below 1 eV from the theoretically expected shape according to the linear cascade theory by Sigmund have been attributed to several different mechanisms: a) choice of a spherical surface barrier instead of a planar surface barrier as usually applied in linear cascade theory, b) thermal evaporation for materials like alkali halides, c) spikes as proposed by Szymonski et al. A further problem arises with the interpretation of spectra at very low velocities. Power broadening which can cause the spectra to extend to 'negative velocities' using a pulsed laser for excitation is discussed and was found to be negligible for the measurement of energy spectra of sputtered species using a cw-dye laser with intensities up to 500 mW/cm^2. It could be shown that the existence of particles with negative velocities is linked to the contribution of linear collision cascades to the total flux. (Author).

In Technique of physical experiment.

Materials of structure elements of high-current proton accelerator and types of nuclear reactions on the protons lost in the process of acceleration, are determined. The relative defect forming ability of protons calculated relatively to neutrons of thermonuclear reactor (14 MeV) and BOR-60 reactor for 13 metals from Be to U is almost linear with the growth of the element number in the periodic system and changes from 8 (for Be) to 200 (for U), in the surface range (or up to 60 for Esub(n)=14 MeV). Radiation change of Nb_3Sn stoichiometric composition is found for protons only: starting from the fluence approximately 10^{24} prot/cm^2 a noticeable formation of Nb_6Sn_5 phase is possible which brings about a considerable decrease of temperature of transition to a superconducting state (approximately up to 1 K) and the reject of the superconducting element.

In Physics of radiation damage and radiation material science.

The review of the works carried out up to 1980 is given. They are based on the local characteristics of metal irradiation damage studied by the methodics which registrate hyperthin interaction (HTI). These investigations are divided in three groups. I.n the first group HTI of the implanted atom excited nucleus with the nearest neighbours in the created collision cascade are studied. The second group is the study of impurity nuclei implanted into metal by usual metallurgical methods and nuclei interaction with the nearest surroundings Under the outside irradiation and thermonuclear treatment. The third group unites the investigations of radiation damage influence on electronic structure and oscillation dynamics of matrix atoms of the irradiated metal. The main results are obtained by nuclear gamma resonance on ^{57}Fe nuclei.

From International symposium on the properties and applications of metal hydrides; Eilat, Israel (9 Apr 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Measurements of the proton spin-lattice relaxation time T_1 are frequently utilized as a basis for estimating the electronic density-of-states (d.o.s.) at the Fermi level, N(E/sub F/), and its dependence on hydrogen concentration, alloy composition, etc., in metal hydrides. This follows from the fact that quite generally the Korringa product T_1/sub e/T (where T_1/sub e/ is the electronic contribution to the measured T_1) is related to N(E/sub F/) by (T_1/sub e/T)/sup -1/2/ proportional to N(E/sub F/). At low temperatures where hydrogen diffusion is negligible, the measured relaxation rate $R_1 = (T_1)$/sup -1/ is expected to be given by $R_1 = R_1$/sub e/ + R_1/sub p/ where R_1/sub e/ = (T_1/sub e/)/sup -1/ and R_1/sub p/ is the relaxation rate due to proton spin diffusion to paramagnetic impurity ions present in the metal. The determination of R_1/sub e/ from measured values of R_1 thus also involves the determination or estimation of R_1/sub p/. As shown recently, the presence of RE impurities at levels as low as 10 parts-per-million (ppM) can produce significant effects. We report determinations of proton T_1/sub e/T in the dihydride phases of Sc, Y, La, and Lu based on samples prepared from the highest purity metals available in the Ames Laboratory and in addition in some cases utilizing the technique of partial deuteration to further suppress the paramagnetic contribution R_1/sub p/.

33672 **(IS-T—1140) Superconductivity in ternary rare earth palladium Heusler compounds.** Johnson, M.J. (Ames Lab., IA (USA)). Jun 1984. Contract W-7405-ENG-82. 57p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013983.

Thesis.

A study of the ternary rare earth palladium Heusler compounds of composition RPd_2X, where R=Sc, Y, Er, Tm, Yb, or Lu, and X=Sn or Pb, was undertaken to investigate the behavior of their superconducting transition temperature under pressure. The transition temperature was linearly depressed to 20 kbar, with dT/sub c//dP typically of the order of 10^{-5} K/bar, which can be explained by a stiffening of the simple cubic palladium sublattice with increasing pressure. The lattice parameter and transition temperature are very disorder-dependent, increasing to maximum values after annealing for two days; resistivity measurements indicate that no phase transitions occur below room temperature.

33673 **(KFK—3628) Exact solutions of rate equations for the calculation of supersaturations of defects and growth rates for voids.** Heidenreich, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Dec 1983. 40p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751445.

Exact solutions of the rate equations are discussed in detail for vanishing and nonvanishing recombination coefficient α. The existence and uniquenes of the solutions are shown for arbitrary sources and sinks and for α not= o.

33674 **(KFK—3651) X-ray investigation of Nb3Ge under high pressure.** Schneider, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Technische Physik). Dec 1983. 59p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751447.

The compressional behaviour of A15-superconductors was investigated in a diamond anvil apparatus using energy dispersive X-ray diffraction at pressures up to 120 kbar and temperatures between 300 K and 4 K. A pronounced anomaly in the pressure dependence of the lattice spacing was observed in the case of the high-Tc superconductors based on Niobium at 78 K and 4 K. This anomaly can be explained by a periodic sublattice displacement of the Niobium atoms together with tetragonal symmetry.

33675 **(LA-UR—84-889) Pressure-dependent resistive behavior of $YbBe_{13}$.** Thompson, J.D.; Fisk, Z.; Willis, J.O. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 3p. (CONF-840842—11). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84010068.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Portions are illegible in microfiche products.

We have studied the effect of hydrostatic pressures up to 16 kbar on the temperature-dependent resistance of $YbBe_{13}$. Anomalies in the low-temperature resistance are discussed in terms of an antiferromagnetically ordered ground state and resonant scattering off thermally populated crystalline electric field levels. A comparison is made to the resistive behavior of UBe_{13}. We find no evidence for superconductivity in $YbBe_{13}$ above 0.08°K.

33676 **(LA-UR—84-1019) Initial slope of the upper critical field of the heavy fermion superconductor UPt_3.** Willis, J.O.; Fisk, Z.; Smith, J.L.; Chen, J.W.; Lambert, S.E.; Maple, M.B. (Los Alamos National Lab., NM (USA); California Univ., San Diego, La Jolla (USA)). 1984. Contract W-7405-ENG-36. 3p. (CONF-840842—6). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84009980.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Portions are illegible in microfiche products.

We have made low field measurements of the upper critical field as a function of temperature for all parallel and perpendicular configurations of magnetic field H, current I, and crystallographic orientation for UPt_3, the heavy fermion superconductor. The curves are quite linear for H parallel I, with slopes of -4.0 T/K for I in the basal plane and -6.3 T/K for I along the c-axis. For H perpendicular I the curves are concave upward near H = 0 and have a generally smaller slope than for the same field applied parallel to the current.

33677 **(LA-UR—84-1051) Dynamics of normal-zone propagation in Ta at small currents.** Overton, W.C. Jr.; Weinstock, H. (Los Alamos National Lab., NM (USA); Illinois Inst. of Tech., Chicago (USA). Dept. of Physics). 1984. Contract W-7405-ENG-36. 3p. (CONF-840842—9). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84009990.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Portions are illegible in microfiche products.

In normal-zone propagation in thin wires embedded in LHe, the velocity of the N-S interface is strongly influenced by heat conductance to the bath. We observe, as usual, the frontal N-S interface propagation at constant velocity. However, for small currents near the critical value, healing of the N-zone back to the S-state occurs, thus forming a propagating S-N interface the velocity of which oscillates in time. We discuss the dynamics of this new phenomenon.

33678 **(LA-UR—84-1053) Thermomagnetic properties of GdPd.** Barclay, J.A.; Overton, W.C. Jr.; Zimm, C.B. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 3p. (CONF-840842—8). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84009991.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Portions are illegible in microfiche products.

The magnetic susceptibility, magnetization, and field-dependent heat capacity of ferromagnetic GdPd have been measured. The magnetic moment of the Gd spin obtained from the saturation magnetization at 4.2°K is enhanced over the free Gd value. The heat capacity shows a large lambda-type magnetic anomaly at the Curie temperature of 40.0 + 0.5°K.

33679 **(LA-UR—84-1203) Low temperature properties of $CeOs_2$.** Torikachvili, M.S.; Maple, M.B.; Meisner, G.P. (California Univ., San Diego, La Jolla (USA). Inst. of Pure and Applied Physical Sciences; Los Alamos National Lab., NM (USA)). Apr 1984. Contract W-7405-ENG-36. 3p. (CONF-840842—13). NTIS, PC A02; 3; GPO Dep. Order Number DE84011333.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Paper copy only, copy does not permit microfiche production.

The binary compound $CeOs_2$ has been prepared in both cubic C15 and hexagonal C14 Laves phases. Measurements of ac magnetic susceptibility, electrical resistivity and specific heat have been performed on both phases. The C14 phase has been found to exhibit superconductivity with a superconducting transition temperature T/sub c/ of 1.1°K.

33680 **(LBL—17237) Effect of surface doping on the oxidation of chromia former alloys.** Landkof, M.; Boone, D.H.; Gray, R.; Levy, A.V.; Yaniv, E. (Lawrence Berkeley Lab., CA (USA)). Apr 1984. Contract AC03-76SF00098. 62p. (CONF-840405—13). NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013390.

From NACE corrosion '84 international forum and exhibition; New Orleans, LA, USA (1 Apr 1984).

Portions are illegible in microfiche products.

Y, Ce, La, Hf, Ca, and Zr were applied to the surfaces of type 304 and 310 stainless steels and IN 738, a nickel base alloy. In order to determine the effect of the minor alloying elements in stainless steels on the surface doping effect, Y was applied to three alloy modifications of type 304SS. The presence or absence of Mn and Si in the alloy on the high temperature corrosion behavior was determined. Several different doping techniques were used to determine which technique was most beneficial to the behavior of the oxide barrier scale. The application of Y, Ce and La was found to enhance the oxidation resistance of the commercial stainless steels while no benefits were found for alloys doped with Hf, Ca and Zr. It was determined that Si had to be present in the type 304 SS for the doping process to enhance the oxidation resistance. There was no beneficial effect on modified 304SS containing Mn only or without Mn or Si. The yttrium doped and undoped modified type 304SS with Si only showed more resistance to scale spallation than any other type 304SS alloy tested, either commercial or modified. 21 figures, 11 tables.

33681 **(SAND—84-8003) Evaluation of the effects of current impulses in a side bonding resistance forge weld.** Formisano, B.D. (Sandia National Labs., Livermore, CA (USA)). Jun 1984. Contract AC04-76DR00789. 32p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013570.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Results of this study show that the temperature, displacement, and bond length increase rapidly during the first two pulses of current, and change very little thereafter. The study also re-

vealed that the plug bottoms out inside the conical hole after the second pulse of current. This indicates that with this particular joint design the process is insensitive to the time duration of current flow beyond two current pulses. After the second current pulse the bond length tends to level off dramatically with little increase thereafter. One could conclude that after the second current pulse the additional three pulses do little to enhance the weld quality. However, the last three pulses did not degrade the quality of the weld.

33682 **Model for the transition in the oxidation of zirconium-base alloys.** Dollins, C.C.; Berquist, B.M. (Bettis Atomic Power Lab., West Mifflin, PA (USA)); Jursich, M. (Control Data Corp., Minneapolis, MN (USA)). *Radiation Effects;* **79**: No. 1-4, 265-273(Dec 1983).

At a weight gain of approximately 20 to 30 mg/dm² during the oxidation of zirconium-base alloys at reactor operating temperatures the oxidation rate accelerates. This is the so-called transition. A mechanistic model has been developed to describe the transition based on the growth and interconnection of small pores along the oxide-metal interface. Once the pores interconnect, coolant can reach the oxide-metal interface and oxidation accelerates. The model has been programmed and incorporated into the previously reported oxidation model. Good agreement has been obtained between the model predictions and experimental data.

33683 **Field-ion microscopy study of ion damage to tungsten.** Farnum, D.J.; Inal, O.T. (New Mexico Inst. of Mining and Technology, Socorro (USA)); Walko, R.J. (Sandia National Labs., Albuquerque, NM (USA)). *Physica Status Solidi [Sectio] A: Applied Research;* **80**: No. 1, 287-303(16 Nov 1983).

The effects of low energy in-situ ion bombardment of tungsten field ion emission surfaces are studied using various ion energies and plasmas produced from pure hydrogen, deuterium, neon, and argon gases. The results show that the average void size and depth of damage increase with ion energy, atomic weight, and ion dosage (the total number of ions to strike the tip per unit area). Sputtering occurs in most samples. In general the highest sputtering damage is observed along the close packed <111> directions.

33684 **Theory of small clusters of helium in metals.** Wilson, W.D. (Sandia National Labs., Albuquerque, NM (USA)). *Radiation Effects;* **78**: No. 1-4, 11-24(Nov 1983). (CONF-820952—).

From International symposium on helium in metals; Juelich, F.R. Germany (21 Sep 1982).

The development of the atomistic theory of small clusters of helium in metals is briefly reviewed with particular regard to the necessary interatomic potentials. The activation energy for interstitial helium motion is then calculated using He-Ni potentials which vary in their derivation from empirical to quantum mechanical (including the effects of the solid). Additional comparisons are made for single helium associated defects in Al where results using metal-metal potentials derived from pseudopotential theory and by empirical means are shown to give rise to only negligible differences. Finally, the theory is applied to the self-trapping of helium in metals, the formation of helium bubbles and associated self-interstitial loops.

33685 **Experimental studies of helium in metals.** Thomas, G.J. (Sandia National Labs., Livermore, CA (USA)). *Radiation Effects;* **78**: No. 1-4, 37-51(Nov 1983). (CONF-820952—).

From International symposium on helium in metals; Juelich, F.R. Germany (21 Sep 1982).

A short review is given of recent experimental studies of helium in metals, emphasizing fundamental He behavior at low temperatures (room temperature and below), low He concentrations (approx. 1 at.% He) and in the absence of radiation induced defects. Some of the main points are: (a) interstitial He is generally locally mobile at room temperature and below, (b) impurities behave as strong unsaturable traps which lose their identity with increasing numbers of trapped He atoms, and (c) the eventual microstructure of He charged metals appears qualitatively the same in pure undamaged materials as in radiation-damaged materials.

33686 **Release of ion-implanted and transmutation-produced helium from nickel.** Poker, D.B. (Oak Ridge National Lab., TN (USA)). *Radiation Effects;* **78**: No. 1-4, 101-104(Nov 1983). (CONF-820952—).

From International symposium on helium in metals; Juelich, F.R. Germany (21 Sep 1982).

Measurements of He release were performed on Ni samples doped by thermal neutron irradiation or ion implantation. Closed and open cylinders of Ni were neutron irradiated at 100 deg C. The amount of He released into the interior of the closed cylinders was equivalent to that produced in the volume of Ni within about 0.5 μm of the surface, indicating some mobility of He at room temperature. The open cylinders were heated in vacuum while the He release was measured. Below 1000 deg C, the amount of He released was equivalent to that produced within 0.02 μm of the surface. Surface evaporation could account for the He release at higher temperatures. Upon melting the Ni, all the remaining He was released. He release from Ni at temperatures between 18 and 600 K was measured after ion implantation of 35 keV He^+ at 18 K. The only significant release was sharply peaked near 50 K. Results presented here on Ni and Cu indicate that the 50 K release does not originate from the metal, but from a carbon surface film which is formed during the implantation. Similar releases were observed following implantations of He into graphite and solid methane.

33687 **Multifilamentary superconducting (NbTa)-Sn composite wire by solid-liquid reaction for possible application above 20 tesla.** Hong, M.; Hull, G.W. Jr.; Fuchs, E.O.; Holthuis, J.T. (Bell Laboratories, Murray Hill, NJ). *Materials Letters;* **2**: No. 2, 165-168(Oct 1983).

Nb alloyed with Ta was employed in fabricating multifilamentary composite wires of (NbTa)-Sn using the liquid-infiltration process. The superconducting A15 phase was formed with subsequent heat treatments at 800-950°C by the solid-liquid reaction. High inductive Tsub(c)'s of 18.2 K with sharp transition width (<0.3 K) and high overall Jsub(c)'s of approx. 1.6 X 10^4 A/cm² at 20 T and 4.2 K were obtained. It was found that 2 wt.% Ta in the Nb was sufficient in the enhancement of the overall Jsub(c) at the high fields and in increasing the Hsub(c2) (4.2 K) to 25 T.

33688 **Microstructure and mechanical properties of precipitation hardened aluminum under high rate deformation.** Grady, D.E.; Asav, J.R.; Rohde, R.W.; Wise, J.L. (Sandia National Lab. Albuquerque, NM). pp 81-100 of Material behavior under high stress and ultrahigh loading rates. Vol. 29. Mescall, J.; Weiss, V. New York, NY; Plenum Publishing Corp. (1983). (CONF-820725—). Contract AC04-76DP00789.

From 29. annual Sagamore Army materials research conference; Lake Placid, NY, USA (19 Jul 1982).

This chapter attempts to correlate the shock compression and quasistatic deformation of 6061-T6 aluminium. Examines recovered specimens which have been shock loaded, and compares results with both static and dynamic mechanical property measurements. Discusses experimental procedures (reshock and unloading experiments, shock recovery techniques, metallographic techniques and coldwork experiments); dynamic strength and wave-profile properties (strength and shear-stress states on the Hugoniot, steady-wave risetime and viscosity); quasistatic and shock metallography studies (metallography of quasistatically deformed material; metallography of shock deformed specimens; comparison of static and shock deformation; correlation of hardness and dynamic strength measurements); and thermal trapping calculations in shocked aluminium (heterogeneous deformation and adiabatic heating in shock-wave loading; energy and risetime relations under steadywave shock compression; heterogeneous temperature calculations in aluminium). Concludes that heterogeneous shear deformation appears to play a role in the dynamic deformation process.

33689 Materials response to large plastic deformation. Stout, M.G.; Hecker, S.S. (Materials Science and Technology Division Los Alamos National Lab. Los Alamos, NM). pp 39-60 of Material behavior under high stress and ultrahigh loading rates. Vol. 29. Mescall, J.; Weiss, V. New York, NY; Plenum Publishing Corp. (1983). (CONF-820725—).

From 29. annual Sagamore Army materials research conference; Lake Placid, NY, USA (19 Jul 1982).

This chapter addresses the influence of deformation mode, crystal structure, material purity, and alloying on stress-strain behavior. Focuses on low strain rate data but attempts to show trends which are also important for large strain, high strain rate predictions. Examines experimental techniques, aluminium and aluminium alloys, copper, nickel, 70-30 brass, and bcc iron and iron alloys. Points out that strain hardening at large plastic strains cannot be inferred from small-strain tensile tests. Finds that saturation (steady state behavior) of the flow stress in fcc materials is not universal. Notes that most metals and alloys at room temperature do not reach steady state saturation at strain levels of 3 to 5.

33690 Thermal conductivity and Lorenz number of plutonium and plutonium-gallium alloys. Andrew, J.F.; Klemens, P.G. (Los Alamos National Lab. Los Alamos, NM 87545). pp 209-218 of Thermal conductivity. Vol. 17. Hust, J.G. New York, NY; Plenum Publishing Corp. (1983). (CONF-8106164—).

From National Bureau of Standards joint conferences: 8. symposium on thermophysical properties; 17. thermal conductivity conference; 8. thermal expansion conference; Gaithersburg, MD, USA (15 Jun 1981).

This chapter presents the results of thermal diffusivity measurements of Pu, Pu-2.7 at.% Ga, Pu-3.5 at.% Ga, and Pu-6.6 at.% Ga from 25°C to around 500°C using a laser flash technique and electronic data acquisition. Finds that although the Lorenz number, L, of pure Pu is well below the Sommerfeld value, L /SUB o/ , except for the α-phase, L exceed L /SUB o/ for the alloys at all temperatures and has a pronounced minimum around 200°C. Attributes the excess at the lower temperatures to lattice conduction and the excess at temperatures above 200°C is attributed to an electronic component. Ascribes the negative deviation of L from L / SUB o/ for pure Pu to a reduction of the electron mobilities in those energy ranges where the 5f bands overlap the conduction bands.

33691 The physical properties of 9 Cr-1 Mo steel from 300 to 1000 K. Williams, R.K.; Graves, R.S.; McElroy, D.L.; Weaver, F.J. (Metals & Ceramics Division Oak Ridge National Lab. Oak Ridge, TN 37830). pp 219-228 of Thermal conductivity. Vol. 17. Hust, J.G. New York, NY; Plenum Publishing Corp. (1983). (CONF-8106164—). Contract W-7405-ENG-26.

From National Bureau of Standards joint conferences: 8. symposium on thermophysical properties; 17. thermal conductivity conference; 8. thermal expansion conference; Gaithersburg, MD, USA (15 Jun 1981).

This chapter studies the thermal conductivity and expansion of an improved 9 Cr-1 Mo steel. Points out that the mechanical properties of 9 Cr-1 Mo steel can be significantly improved by heat-treating material that contains small additions of the carbide-forming elements V and Nb. Shows that the electron and phonon thermal conductivity components are both quite sensitive to Si content. Finds that the thermal expansion of standard commercial material is indistinguishable from that of the improved alloy.

33692 Theory of radiation-induced segregation. Wiedersich, H.; Lam, N.Q. (Argonne National Lab., IL (USA)). pp 1-46 of Phase transformations during irradiation. Nolfi, F.V. Jr. (ed.). Barking, England; Applied Science Publishers Ltd. (1983).

In this paper we review the basic knowledge of the mechanisms involved in radiation-induced segregation and discuss models and model calculations that describe the process. The next section presents a short, qualitative description of the segregation process which requires the existence of persistent defect fluxes and their preferential coupling to the fluxes of alloying components. The causes of the preferential coupling are attractive interactions between defects and some alloying elements, and/or preferential migration of defects via atoms of some alloy components. In dilute alloys, the interactions can be described by vacancy-solute and interstitial-solute binding, i.e. the formation of defect-solute complexes; the preferential migration can include complex migration as well as preferential defect migration via solute or solvent atoms. Section 3 gives an overview of point-defect solute interactions in dilute alloys and their effects on solute fluxes. The coupling of defect and atom fluxes to composition and defect concentration gradients in concentrated alloys is discussed in Section 4. The phenomenological equations describing the segregation process are formulated, and the computational formalism to obtain time-dependent solutions to the phenomenological equations is outlined in Section 5. Some model calculation results are discussed in Section 6.

33693 Effects of irradiation on diffusion in metals and alloys. Rothman, S.J. (Argonne National Lab., IL (USA)). pp 189-211 of Phase transformations during irradiation. Nolfi, F.V. Jr. (ed.). Barking, England; Applied Science Publishers Ltd. (1983).

Diffusion via the motion of radiation-induced point defects is well understood for simple systems, and satisfactory agreement between theory and experiment is obtained. For complicated systems, our understanding is qualitative, as more phenomena come into play. Equations for analyzing some aspects of the problem exist, but numerical values for the necessary atomic-defect parameters, especially those that deal with interstitials, are not well known. In addition to its importance in nuclear technology, radiation-enhanced diffusion also enters into ion-beam technology.

33694 Non-equilibrium segregation in irradiated alloys. Rehn, L.E.; Okamoto, P.R. (Argonne National Lab., IL (USA)). pp 247-290 of Phase transformations during irradiation. Nolfi, F.V. Jr. (ed.). Barking, England; Applied Science Publishers Ltd. (1983).

Experimental observations of radiation-induced segregation in four model binary alloy systems are reviewed in the present paper. The systems are Ni-Si and Ni-Sb, in which strong enrichment of the undersize solute (Si) and depletion of the oversize solute (Sb) occur at defect sinks, Cu-Ni, in which enrichment of the undersize component of a highly concentrated alloy occurs at sinks, and Ni-Ge, in which the observed direction of segregation is in violation of the size-effect correlation. Quantitative measurements of composition as a function of depth in the near-surface region reveal that several qualitative features of radiation-induced segregation are common to all four alloy systems.

33695 Implications of radiation-induced segregation and phase instability on alloy design. Bloom, E.E.; Stiegler, J.O. (Oak Ridge National Lab., TN (USA)). pp 331-355 of Phase transformations during irradiation. Nolfi, F.V. Jr. (ed.). Barking, England; Applied Science Publishers Ltd. (1983).

The subject is reviewed in sections, entitled: introduction (including - radiation damage production in typical reactor components); structure- and composition-sensitive properties (including - summary of failure mechanisms and design rules; dependence of microhardness on composition of a nickel-chromium stainless steel; composition dependence of irradiation-induced swelling of Fe-Cr-Ni ternary alloys; common fracture modes in highly irradiated structural alloys); mechanisms of irradiation-induced solute segregation; phase stability and irradiation-induced segregation; alloy design; summary.

33696 X-ray diffraction study of shape memory in uranium-niobium alloys. Carpenter, D.A.; Vandermeer, R.A. (Oak Ridge Y-12 Plant Union Carbide Corp., Nuclear Division Oak Ridge, TN 37830). pp 307-312 of Advances in x-ray analysis. Vol. 26. Hubbard, C.R.; Barrett, C.S.; Leyden, D.E.; Predecki, P.K. New York, NY; Plenum Publishing Corp. (1982). (CONF-820861—). Contract W-7405-ENG-26.

From 31. annual Denver X-ray conference; Denver, CO, USA (3 Aug 1982).

This chapter reports on an x-ray diffraction study of the reversible deformation modes associated with the shape memory

effect carried out on a series of uranium-niobium alloys near the monotectoid composition (6.2 wt. % Nb). Measures diffraction patterns as a function of strain, in situ, while the specimens were under stress as part of an attempt to explain the "easyflow", low-strain plateau in the stress-strain curve. Analyzes data obtained from a monoclinic alloy and a dual-phase monoclinic + tetragonal alloy. Finds that the principal reversible deformation modes in the single-phase monoclinic alloys and in the dual-phase monoclinic + tetragonal alloys correspond largely to those observed in other shape-memory alloys.

33697 **Digital faradaic impedance measurements (DPIM) on an array processor-enhanced system.** Smyrl, W.H. (Sandia National Lab., Albuquerque, NM). *Proceedings - Electrochemical Society;* **81-82**: 342(1981). (CONF-811013—Vol.81-82-Absts). Contract AC04-76DP00789.

REFER ALSO TO CITATION(S) 32695, 32700, 32701, 32729, 33192, 33493, 33589, 33745, 33829, 34919

33699 **(BMFT-FB-T—83-297) MoO_3, ex MoS_2 with further processing of the metal-bearing waste sulfuric acid generated in the process.** Bauer, G.; Eckert, J.; Retelsdorf, H.J. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Dec 1983. 18p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751285.

After a literature study and preliminary tests, laboratory scale tests were made which yielded the following results: MoS_2-concentrates of all available grades can be completely converted to molybdenum oxide without previous treatment in an oxygen leaching process in an autoclave. The sulfuric acid produced in the process is recycled, SO_4 (in form of gypsum), Cu, and Re are periodically removed from the solution. The processing parameters determined in the laboratory experiments were tested at semi-commercial scale. While tests in a tube reactor had to be concluded without success, investigations in a four-compartment stirrable autoclave were successfull. With reaction temperatures of about 225°C and 3-5 bar O_2 partial pressure the oxidation is complete after about 8 h. The molybdenum oxide technical grade after drying and calcining contains max. 0.10% S. It can be processed to ferro-molybdenum without difficulties. By recycling of the sulfuric acid solution produced it is possible to recover in form of MoO_3 technical grade more than 98% of the molybdenum charged in MoS_2. The Re-recovery rate is considerably higher than that in the MoS_2 roasting process and can, in relation to the concentrates' contents, reach more than 90%. Even high-Cu containing concentrates can be processed without problems; Cu-sulfate is removed from the recycled solution by cooling crystallization. The sulfur in the MoS_2-concentrate is oxidised to sulfate and removed from the circulating solution in form of gypsum. The processing parameters determined are to be tested in a continuously working pilot plant in processing of all varieties of raw materials in long-term operations.

33700 **(BMFT-FB-T—83-322) Development of silicon nitride gas turbine components. Phase 2.** Gugel, E.; Kessel, H.; Leimer, G.; Lindner, H.; Novotny, A.; Petzenhauser, I.; Steinmann, D. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Dec 1983. 103p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84751420.

Portions are illegible in microfiche products.

The project, which was performed by Annawerk GmbH, aimed at the development of reaction-bonded silicon nitride (RBSN) and hot-pressed silicon nitride (HPSN) and at the new development of pressureless-sintered silicon nitride (SSN) with regard to materials technology and testing. The main tasks were materials development, component fabrication and testing, and test methods. In the field of RBSN powder technology, pre-sintering and mechanical properties could be improved. The effects of additives, e.g. Fe, and temperature-dependet deterioration of strength in the first phase of the project were clarified in theory and practice. In the case of HPSN with MgO and Y_2O_3 as additives, further improvements were made in mechanical strength at room and high temperature and in oxidation resistance. Complex-shaped prototype components were fabricated and tested. A free grain polishing post-treatment promised to be very sucessful. Further improvement of testing procedures included nondestructive testing of components by ultrasonics, resonance-frequency measurements and statistical methods of fracture mechanics for life predictions. With regard to SSN remarkable progress in materials development was achieved and applied also in components.

33701 **(CONF-840842—16) Specific heat-measurement of an $ErRh_4B_4$ single crystal.** Depuydt, J.M.; Dahlberg, E.D.; Hinks, D.G. (Minnesota Univ., Minneapolis (USA). Dept. of Physics and Astronomy; Argonne National Lab., IL (USA)). Apr 1984. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84011705.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Measurements of the heat capacity of a single crystal of $ErRh_4B_4$ have been made in the temperature range of 0.4 K to 1.5 K. This temperature range includes the temperature for the superconducting to ferromagnetic transition. The measurements include data taken on both heating and cooling of the sample. The transition as measured when the heat capacity is hysteretic in temperature and has a sharp maximum in both the heating and cooling cycles which occurs at the same temperature as the occurrence and disappearance of the satellite lines observed in the neutron scattering.

33702 **(CONF-8405190—1) Chemical vapor deposition of erosion resistant TiB_2 coatings.** Caputo, A.J.; Lackey, W.J.; Wright, I.G. (Oak Ridge National Lab., TN (USA); Battelle Columbus Labs., OH (USA)). 1984. Contract AC05-84OR21400. 31p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012351.

From 9. chemical vapor deposition conference; Cincinnati, OH, USA (6 May 1984).

Portions are illegible in microfiche products.

TiB_2 coatings were chemically vapor deposited by hydrogen reduction of $TiCl_4$ and BCl_3. Process variables investigated were deposition temperatures from 750 to 1050°C and the $TiCl_4$ and BCl_3 flow rates. Various grades of commercially available cemented carbides and experimental nickel-bonded TiB_2 were used as substrates. Resistance of the coatings to erosion was evaluated using a hot, coal-oil slurry impingement test. The TiB_2 deposition rate was temperature dependent ranging from 0.1 to 2.9 μm/min between 750 and 950°C. The surface morphology of the coatings was nodular with the size of the nodules increasing with temperature. The coatings were dense and adherent. The grain size varied with deposition conditions. TEM showed the grain size to be very small (2 to 300 nm), increasing with distance from the substrate. Electron microscopy and x-ray diffraction indicated only the presence of single-phase TiB_2 and ion microprobe analysis revealed a constant Ti/B ratio across the coating thickness. Energy dispersive fluorescence analyses showed coatings deposited at 800°C contained more chlorine than coatings deposited at the higher temperatures. Coating microhardness and erosion resistance were temperature dependent. The hardness of coatings deposited at 800 and 900°C were 15 and 32 GPa, respectively. Coatings deposited at 850°C or below experienced extensive erosion (up to 30 μm deep craters during a 1 h test) while those deposited at 900°C and above showed very little or no erosion (0 to 2 μm).

33703 (DOE/ER—0113/3, pp 1-3) **Property studies of solid tritium breeding materials.** Johnson, C.E.; Fischer, A.K.; Shearer, J.A.; Tam, S.W.; Tetenbaum, M. (Argonne National Lab., IL). May 1984. NTIS, PC A04/MF A01. Order Number TI84011825.

In Sixth annual progress report on special purpose materials for magnetically confined fusion reactors.

We have completed an experimental investigation of the solubility of H_2O in Li_2O. The data from this work have been analyzed and placed in a form suitable for thermodynamic calculations. These calculations permit detailed consideration of the thermodynamic (not kinetic) characteristics of tritium release from the Li_2O system as well as of the chemical and thermal stability. Included is a firmer understanding of the phase relationships and vaporization behavior. Ceramics other than Li_2O that are to be treated similarly are γ-$LiAlO_2$, Li_4SiO_4, Li_2ZrO_6, and Li_2BeO_2.

33704 (DOE/ER—0113/3, pp 17-22) **TRIO-01 experiment.** Clemmer, R.G.; Finn, P.A.; Billone, M.C.; Misra, B.; Greenwood, L.R.; Dyer, F.F.; Dudley, I.T.; Bate, L.C.; Clemmer, E.D.; Fisher, P.W. (Argonne National Lab., IL). May 1984. NTIS, PC A04/MF A01. Order Number TI84011825.

In Sixth annual progress report on special purpose materials for magnetically confined fusion reactors.

The TRIO-01 experiment was designed to test in-situ tritium recovery and heat transfer performance of a candidate solid breeder, γ-$LiAlO_2$. The results showed that nearly all the tritium generated was recovered. Only <0.1 wppM tritium remained in the solid after irradiation testing. The heat transfer performance showed that temperature profiles can be effectively controlled.

33705 (DOE/ER—0113/3, pp 23-24) **Evaluation of electrical properties of SiC for ICRH window applications.** Fowler, J.D. Jr. (Los Alamos National Lab., NM). May 1984. NTIS, PC A04/MF A01. Order Number TI84011825.

In Sixth annual progress report on special purpose materials for magnetically confined fusion reactors.

Silicon carbide has been proposed as an ICRH window material because of its inherent strength and compatibility with the fusion first-wall environment. Because of its low resistivity relative to other ceramics, its electrical characteristics may be of questionable suitability. The purpose of this preliminary study was to determine whether one common form of SiC is suitable for this application.

33706 (DOE/ER—0113/3, pp 25-29) **Structural performance of low-activation ceramics after high-dose neutron irradiation.** Clinard, F.W. Jr.; Hurley, G.F.; Hobbs, L.W.; Rohr, D.L.; Youngman, R.A. (Los Alamos National Lab., NM). May 1984. NTIS, PC A04/MF A01. Order Number TI84011825.

In Sixth annual progress report on special purpose materials for magnetically confined fusion reactors.

Several forms of the ceramics $MgAl_2O_4$, Al_2O_3, Si_3N_4, and SiC/graphite laminate were irradiated to 2 x 10^{26}n/m^2(E > 0.1 MeV) at 680 and 815K. Dimensional changes ranged for near-zero for spinels to ~ 7 vol % shrinkage for graphite. Strength of spinels was increased, while that for Al_2O_3 and Si_3N_4 was not greatly changed. The SiC/graphite composite suffered almost-complete delamination.

Portions are illegible in microfiche products.

For $ErRh_4B_4$, owing to the critical spin fluctuations just above T/sub s/ (> T/sub c2/), the critical temperature at which surface ferromagnetism appears, the reciprocal penetration depth, λ^{-1}, decreases smoothly as T decreases toward T/sub s/. For $Er_{0.5}Ho_{0.5}Rh_4B_4$, the decrease in λ^{-1} for T > T/sub c2/ is very small, and λ^{-1} decreases abruptly at T/sub c2/.

33711 **(PB—84-178920) Investigation of methods for producing reactor-grade zirconium oxide from a zirconium-bearing chloride-sulfate strip liquor solution. Report of investigations/1984.** MacDonald, D.J.; Defilippi, C.E.; Henry, H.G. (Bureau of Mines, Reno, NV (USA). Reno Research Center). Feb 1984. 16p. (BM-RI—8850). NTIS, PC A02/MF A01.

The Bureau of Mines investigated two alternative methods for treating a zirconium-bearing chloride-sulfate strip liquor to obtain reactor-grade ZrO2. One method involves neutralization with NH3 and the other hydrothermal precipitation. The strip liquor was derived from zircon sand by a Bureau of Mines method for separating zirconium and hafnium via solvent extraction with a tertiary amine. Neutralization with NH3 to precipitate hydrous zirconium oxide required 0.9 to 1.1 g NH3 per gram of zirconium. The NH3 can be recovered for recycle. ZrO2 that met reactor-grade specifications was produced by precipitation with NH3. Hydrothermal precipitation of ZrO2 from strip liquor required that the solution be maintained at 260C and 680 psi for 10 min and in a noncorrodible pressure vessel. In bench-scale experiments both methods gave zirconium recoveries greater than 99 pct.

33712 **(UCRL—15603) Investigation of shock activated sintering and shock wave consolidation of selected powder materials. Final report.** Mote, J.D.; Fitzpatrick, J.J. (Denver Research Inst., CO (USA)). Feb 1984. Contract W-7405-ENG-48. 49p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013074.

Portions are illegible in microfiche products.

Objective of the first part of the program was to investigate the shock activation of titanium carbide, titanium diboride, aluminum nitride and aluminum oxide powders using the cylindrical geometry. A series of shock activation experiments was conducted in which the starting temperature of the material was the major variable. The effect of temperature on the defect structure created when the sample was subsequently shocked was investigated. Em-

phasis was then shifted to the direct consolidation of the selected powders. Again the cylindrical configuration was chosen and the initial temperature was the major variable. In both cases, the shock wave was created by detonating a uniform layer of powdered explosive which surrounded the sample container. The explosive layer is simultaneously initiated around the periphery of the cylinder at one end. The circumferential shock front thus progressed axially along the sample container wall.

33713 Optical-phonon structure and precision neutron total cross section measurements of zirconium hydride. Malik, S.S. (Rhode Island Univ., Kingston (USA). Dept. of Physics); Rorer, D.C.; Brunhart, G. (Brookhaven National Lab., Upton, NY (USA)). *Journal of Physics F: Metal Physics;* **14**: No. 1, 73-81(Jan 1984).

Precision total neutron cross section measurements of ZrHsub(1.58) were performed using a highly monochromatic neutron beam for neutron energies between 0.035 and 1.1 eV. The experimental values of the cross section in the region of the one-phonon optical peak (0.100 eV < Esub(n) < 0.250 eV) compare well with calculations if one assumes that the phonon spectrum, g(epsilon), is represented by three Gaussians centred at 0.132, 0.137 and 0.151 eV, with associated widths of 0.05, 0.02 and 0.01 eV, respectively. The phonon spectrum g(epsilon) departs from the calculations as exemplified by the central force (CF) model of ZrH_2. Such departures may arise due to non-central forces and tetragonality. The structure of g(epsilon) in some respects is similar to that observed in inelastic neutron scattering cross section measurements. The results from these two independent and different types of measurements provide sufficient basis for further attempts toward a more realistic theoretical model of ZrH_2.

33714 (LA-tr—84-21) Effect of pressure on the solubility of molecular water in a β-phase palladium-hydrogen system. Perminov, P.S.; Orlov, A.A.; Frumkin, A.N. Translated from *Doklady Akademii Nauk SSSR ;* **84**: No. 4, 749-752(1984). Contract W-7405-ENG-36. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013368. DE84013368

Portions are illegible in microfiche products.

The experimental data presented demonstrate the presence of a logarithmic relationship in the palladium β-phase region up to concentrations of 0.92 g/atm H/g-atm Pd and a satisfactory agreement between the obtained results and electrochemical data. A logarithmic relationship very probably exists also for other solutions of gases in metals in regions of high lattice filling.

33715 Performance results on a C-SiC alloy coating chemically vapor-deposited onto graphite substrates. Trester, P.W.; Hopkins, G.R.; Kaae, J.L.; Whitley, J. (GA Technologies, Inc., San Diego, CA). *Thin Solid Films;* **108**: No. 4, 383-393(28 Oct 1983). (CONF-830443—).

From Metallurgical coatings conference; San Diego, CA, USA (18 Apr 1983).

A new coating material was successfully tested in both the limiter and the beam armor tile positions in Doublet III, an experimental tokamak fusion device. The coating material is an alloy of about 10 wt.%SiC in pyrolytic carbon deposited onto graphite substrate tiles of sizes up to 10 cm X 10 cm X 2.5 cm. Performance of the coating on graphite tiles under conditions of localized thermal shock was also investigated in laboratory simulation studies using electron beam energy depositions at power densities greater than levels normally experienced in tokamak service. The results of the test are presented along with observations made during surface examination and microstructural evaluation of the coating. The coating features and deposition model are also described. In a review of related studies of the C-SiC alloy coating, emphasis is placed on the two key advantages, low atomic number and low chemical sputtering, offered by this coating for use on graphite substrates to achieve improved plasma performance in both present and next-generation fusion devices.

33716 X-ray energy dispersive spectroscopy of intergranular phases in βll sialons. Dinger, T.R.; Thomas, G. (Dept. of Materials Science and Mineral Eng. and the Materials and Molecular Research Division Lawrence Berkeley Lab., Univ. of California Berkeley, CA 94720). pp 339-350 of Advances in materials characterization. Vol. 15. Rossington, D.R.; Condrate, R.A.; Snyder, R.L. New York, NY; Plenum Publishing Corp. (1983). (CONF-820891—). Contract AC03-76SF00098.

From 18. ceramic science conference on advances in materials characterization; Alfred, NY, USA (16 Aug 1982).

The purpose of this chapter is to determine whether segregation of impurities or A1 partitioning is occurring, and whether these mechanisms can then be interpreted as a cause for the retention of noncrystalline intergranular phases in low A1 solid solution alloys. Uses x-ray energy dispersive spectroscopy in conjunction with scanning transmission electron microscopy to qualitatively and semi-quantitatively characterize retained noncrystalline phases in several compositions of sialons. Uses diffuse dark field imaging in conventional transmission mode to identify noncrystalline phases prior to x-ray microanalysis. Finds that partitioning of A1 and impurity atoms does not occur for these compositions except in isolated cases. Suggests that Fe impurities are readily incorporated into the matrix phase.

33717 Characterization of imperfections in plasma-sprayed titania. Berndt, C.C.; Herman, H.; Jonca, A.; Korlipara, R.; MacCrone, R.K.; Templeton, T.; Zatorski, R.A. (Dept. of Materials Science & Eng. SUNY at Stony Brook, NY 11794). pp 465-472 of Advances in materials characterization. Vol. 15. Rossington, D.R.; Condrate, R.A.; Snyder, R.L. New York, NY; Plenum Publishing Corp. (1983). (CONF-820891—). Contract AC02-79ER10428.

From 18. ceramic science conference on advances in materials characterization; Alfred, NY, USA (16 Aug 1982).

This chapter presents a magnetic and morphological study of plasma-sprayed TiO_2 coatings by examining the EPR spectra at various temperatures, the dc magnetization, their microstructure, and their chemistry using electron microprobe analysis. Discusses plasma spraying, magnetic measurements, substrate-sprayed specimens, adhesion, and the defect state. Shows magnetic measurements to be a powerful method of obtaining new information about plasmasprayed oxides. Demonstrates that significant interaction in the form of substrate melting occurs on the impingement of the molten particles. Notes that although the temperature dependence suggests metallic inclusions, the deduced magnetization is not in agreement with the magnitude appropriate for iron. Finds that the predominant ionic defect detected was the Ti^{+3} ion, in concentrations very similar to titania, reduced under moderate conditions.

33718 Surface characteristics of yttria precursors in relation to their sintering behavior. Akinc, M.; Rasmussen, M.D. (Ames Lab., Iowa State Univ. Ames, IA). pp 159-170 of Advances in materials characterization. Vol. 15. Rossington, D.R.; Condrate, R.A.; Snyder, R.L. New York, NY; Plenum Publishing Corp. (1983). (CONF-820891—). Contract W-7405-ENG-82.

From 18. ceramic science conference on advances in materials characterization; Alfred, NY, USA (16 Aug 1982).

This chapter examines the effect of various drying techniques and the surface characteristics of the yttria precursors, and draws some correlations between precursor characteristics and the sinterability of the oxide powders. Discusses the precipitation of the precursors and the sintering experiments. Finds that the method of precursor drying has a major effect (probably more than any other step) on the sinterability and microstructure of the yttria ceramics. Assigns a tentative value for the isoelectric point for freshly prepared hydroxide and offers an explanation for the effect of the drying technique on the sinterability of yttria.

3603 Composite Materials

33719 **(DOE/ER/04027—1) Probabilistic models of the stress-rupture of composite materials: summary. Final report, June 15, 1976-June 14, 1984.** Phoenix, S.L. (Cornell Univ., Ithaca, NY (USA). Sibley School of Mechanical and Aerospace Engineering). Jun 1984. Contract AC02-76ER04027. 35p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013477.

Portions are illegible in microfiche products.

Time-dependent failure in the long term (stress- or creep-rupture) results from flaw growth in the fibers, and/or viscoelastic creep in the matrix. Progress has been made in modeling the failure process described. A matrix-impregnated bundle is viewed as a chain of short microbundles with localized load-sharing among fiber elements in a cross-section. The model for fiber failure has its roots in the thermal kinetics of molecular slippage and scission. Various localized load-sharing rules for fiber elements in a microbundle have been assumed. Early research focused on static small bundles. Subsequently, three powerful asymptotic methods were developed. Progress was made in modeling statistical failure in 3-D composites with fibers arranged in a hexagonal array, developing asymptotic analyses for the time-dependent problem where the load-sharing among fibers is elastic but the fiber strength decays stochastically in time and experimental verification of the model. Progress was also made in developing a powerful recursion analysis for k-failure in the time-dependent problem. In order to use the results in creep-rupture settings, we first modified the fiber model to allow for random initial fiber breaks and finite molecular length in our crystal model for fiber failure. A Markov analysis was developed for small bundles. Key limit theorems for k-failure were developed thus verifying the existence of the characteristic distribution for composite lifetime. Randomly spaced initial fiber breaks weaken the composite and increase its variability in lifetime. We also demonstrated how a Weibull shape parameter value of less than one can occur for fiber lifetime. Effect of gauge length on the strength distribution of filaments was examined, using Weibull statistics. Values for the shape parameter calculated at a fixed gauge length are lower than those obtained by a procedure based on varying the gauge length.

33720 (INIS-mf—8921, pp 68) **Self-duality and the critical properties of the low field Hall effect in two-dimensional and three-dimensional metal-insulator composites.** Kantor, Y.; Bergman, D.J. (Tel Aviv Univ. (Israel). Dept. of Physics and Astronomy). 1983. NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780235. (CONF-8303128—Summ.).

From Israel Physical Society annual meeting; Ramat-Gan, Israel (24 Mar 1983).

33721 **(PB—84-178201) Fibre reinforced plastics at cryogenic temperatures: a listing containing 315 references.** Summerscales, J.; Short, D. (Plymouth Composite Materials Research Group (England)). Mar 1984. 23p. NTIS, PC E03/MF E01.

See also PB84-178227.

This listing of current world literature on cryogenic properties of fiber reinforced composite materials is arranged by alphabetical sequence of the authors' surnames, with chronological listing within that group. Anonymous papers are included at the end of the list. The coverage includes journal articles, textbook chapters, establishment reports, proceedings, patents and dissertations. The bibliographic detail has been compressed in order to minimize the storage space used on the Polytechnic PRIME 9950/10Mb computer where the database was stored on a magnetic disc.

33722 **(UCID—19789) Matrix-dominated time-dependent deformation and damage of graphite/epoxy composite experimental data under creep and recovery.** Wu, E.M.; Sanchez, R.J.; Nguyen, N.Q. (Lawrence Livermore National Lab., CA (USA)). Jun 1983. Contract W-7405-ENG-48. 394p. (AFWAL-TR—83-3066). NTIS, PC A17/MF A01; 1; GPO Dep. Order Number DE84013069.

Portions are illegible in microfiche products.

The objective of this report is to disseminate experimental data of matrix-dominated time-dependent deformation and time-dependent damage in graphite-epoxy composite. The composite specimens were +- 45° T300/5208 laminates tested in tension under creep and creep-recovery with complete instrumentation for stress, strain, and time recordings. Experimental data was recorded and archived in digital form. Polynomial series are fitted to the experimental data for compilation, dissemination and future retrieval.

33723 **(UCRL—90604) Cure reactions, network structure and mechanical response of diaminodiphenyl sulfone cured tetraglycidyl 4,4'diaminodiphenyl methane epoxies.** Mones, E.T.; Morgan, R.J. (Lawrence Livermore National Lab., CA (USA)). 11 May 1984. Contract W-7405-ENG-48. 7p. (CONF-840805—16). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012607.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

Portions are illegible in microfiche products.

Diaminodiphenyl sulfone (DDS) cured tetraglycidyl 4,4'diaminodiphenyl methane (TGDDM) epoxies are the most common composite matrices utilized in high performance fibrous composites. This paper reports latest Fourier transform infrared spectroscopy (FTIR) studies of the cure reactions and network structure of TGDDM-DDS epoxies.

3604 Polymers And Plastics

REFER ALSO TO CITATION(S) 32717, 33184, 33325

33724 **(AD-A—140020/9) Surface and bulk phase separations in block copolymers and their blends. Interim report 30 Sep 82-30 Dec 83.** Patel, N.M.; Dwight, D.W. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). Mar 1984. 137p. (VPI-E—84-7). NTIS, PC A07/MF A01.

Surface and bulk properties have been studied in terms of composition and morphology of siloxane containing block copolymers and their blends with homopolymers. X-ray Photoelectron Spectroscopy (XPS) has been used to obtain the compositional information from the top 60 angstroms or so at the surface. Transmission Electron Microscopy (TEM) was utilized to probe the bulk morphology. An attempt is made to compare the bulk and the surface and find possible mechanisms governing them. It is found that solvent-cast neat block copolymers have a uniform layer at the surface that is rich in siloxane whereas their bulk has a microphase-separated domain structure. In case of blends, siloxane enrichment is quite pronounced even at bulk concentrations as low as 0.05% w/w siloxane. Amount of surface siloxane as a function of bulk content is studied with the help of XPS. At the same time, the bulk morphology of these blends is studied by TEM. The changes occuring in the surface and the bulk are found to have similar patterns.

33725 (DOE/ER—0113/3, pp 40-47) **Cryogenic neutron irradiation effects in organic insulators for superconducting coils.** Fowler, J.D. Jr.; Clinard, F.W. Jr. (Los Alamos National Lab., NM). May 1984. NTIS, PC A04/MF A01. Order Number TI84011825.

In Sixth annual progress report on special purpose materials for magnetically confined fusion reactors.

Samples of three epoxy-based and three polyimide-based materials were irradiated up to 4.1 x 10^{21} n/m^2 at 4 K. Electrical properties subsequently measured at 295 and 80 K showed no major changes. Fraction of original strength retained at 75 K for the three materials tested to date were: 33% for G-10 CR, 88% for G-11 CR, and ~ 100% for NP-530. Strengths at 300 K were less affected.

33726 (DOE/ER—0113/3, pp 48-51) **Materials and test methods.** Kasen, M.B. (National Bureau of Standards, Boulder, CO). May 1984. NTIS, PC A04/MF A01. Order Number TI84011825.

In Sixth annual progress report on special purpose materials for magnetically confined fusion reactors.

The industrial specification for production of the G-10CR grade of cryogenic high-pressure laminate has been revised and accepted by US manufacturers. The objective was to make the specification as generic as possible without adversely affecting perform-

ance and to add a material performance criteria to the specification. G-10CR and G-11CR products have been produced by five US industrial laminating forms. No significant differences in cryogenic mechanical properties were found among G-10CR material produced by these manufacturers. This indicates that the specifications are fulfilling their intended purpose. An efficient system for producing research materials for systematic screening of the parameters influencing cryogenic radiation resistance was devised. Laboratories in Japan and England have agreed to actively cooperate with NBS in further development of this system.

33727 **(DOE/ER/10912—3) Rubber elasticity. Progress report, April 1, 1983-March 15, 1984.** Eichinger, B.E. (Washington Univ., Seattle (USA). Dept. of Chemistry). 1984. Contract AT06-81ER10912. 6p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013748.

Portions are illegible in microfiche products.

The progress report submitted one year ago reviewed work on random networks, polymeric chelates, and differential sorption. Within the past year our group has continued its research in these areas and has added two major new thrusts into: (1) the study of the critical phenomenon of gelation; and (2) the theory of the shape distribution of macromolecules.

33730 **(PB—84-175538) Mechanical behavior of ultra high molecular weight polyethylene. Annual report No. 4, 1 Oct 82-30 Sep 83.** Crissman, J.M. (National Bureau of Standards, Washington, DC (USA)). Jan 1984. 44p. (NBSIR—84-2808(FDA)). NTIS, PC A03/MF A01.

Sponsored in part by Food and Drug Administration, Silver Spring, MD. Bureau of Medical Devices.

This report describes work done during FY 1983 under task 80-01, NBS-FDA/BMD (Bureau of Medical Devices) Interagency Agreement. The report covers the fourth year of a four year project concerned with the study of the morphology and mechanical properties of ultra high molecular weight polyethylene (UHMWPE). The work done during FY 1983 dealt principally with the following aspects of the mechanical behavior of UHMWPE, (1) the temperature dependence of the creep and recovery behavior of uniaxial extension and compression at small deformations, (2) longer term (>1 day) creep and recovery behavior of uniaxial extension and compression at small deformations, (3) the effect of gamma-irradiation on the creep and recovery behavior, and (4) the effect of gamma-irradiation on the environmental stress-crack resistance of UHMWPE.

33731 **(SAND—84-0891C) Poly(trimethylsilylacetylene): a tractable, synthetically manipulable polyacetylene derivative.** Zeigler, J.M. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 12p. (CONF-840805—10). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84010299.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

Portions are illegible in microfiche products.

A soluble, synthetically manipulable polyacetylene derivative, poly(trimethylsilylacetylene) (PTMSA) (C(Si)CH$_3$)$_3$=CH)/sub n/ can be prepared in good yield with molecular weights in excess of 10^5 by polymerization with a new class of catalysts formed by mixing WCl_6 with organolithium or organomagnesium reagents. The polymer possesses moderate O_2 stability and can be reversibly doped with I_2 vapor to a conductivity of 10^{-4} S/cm. The unique ability of silyl substituents to stabilize charged intermediates and undergo ipso substitution allows partial replacement of the silyl groups in PTMSA by both electrophilic and nucleophilic reagents. Thus, desilation of PTMSA with fluoride provides a soluble TMSA-acetylene copolymer. Additional synthetic transformations of PTMSA will be reported along with conductivity data on some of the new materials prepared from PTMSA.

33732 **(UCRL—90642) Dynamic overstresses in fibrous polymeric materials.** Cook, R.C.; Mercer, M.B. (Lawrence Livermore National Lab., CA (USA)). 11 May 1984. Contract W-7405-ENG-48. 7p. (CONF-840805—17). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012605.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

The work most closely related to the study presented here is that of Hedgepeth, in which he analyzes the stress redistribution due to filament failure in a sheet of parallel filaments which carry normal loads and are embedded in a matrix which carries only shear. In our work we have studied the similar discrete problem where the filaments have been replaced by chains of harmonically coupled masses and the shear acts only between mass points on neighboring chains. Our motivation in studying a discrete system is to reduce the lower end of the scale of applicability of the model to the molecular level. Our molecular dynamics techniques also allow us to easily investigate the three-dimensional problem not treated by Hedgepeth. The model is described and a comparison of our results and those of Hedgepeth made.

33733 **(UCRL—90657) Viscoelastic and aging characteristics of polymers.** Feng, W.W. (Lawrence Livermore National Lab., CA (USA)). Apr 1984. Contract W-7405-ENG-48. 13p. (CONF-8406138—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012689.

From 8. inter-American conference on materials technology; San Juan, Puerto Rico (25 Jun 1984).

Portions are illegible in microfiche products.

This paper concerns the time dependent mechanical properties for incompressible polymer-like materials subjected to finite deformations. There are two parts: the viscoelastic effects and the aging characteristics. A method for determining these mechanical properties is presented in detail.

33734 **Low-temperature specific heat of PTFE (Teflon) at pressures to 5.2 kbar.** Boyer, J.D.; Lasjaunias, J.C.; Fisher, R.A.; Phillips, N.E. (Lawrence Berkeley Lab., CA). *Journal of Non-Crystalline Solids;* **55**: 413-432(1983). Contract AC03-76SF00098.

The specific heat of PTFE (Teflon) has been measured between 0.3 and 20 K at zero pressure, and between 1 and 20 K at five other pressures ranging up to 5.2 kbar. The specific heat anomalies typical of amorphous materials were observed. The linear term is smaller than for other organic polymers and is closer in magnitude to those of high purity glassy insulators. At zero pressure the T^3 term in the specific heat exceeds that calculated from the sound velocities by 24%. The evolution with pressure of the T^3 term and of the maximum in C/T^3 are very similar, suggesting a close relation between the vibrational modes that contribute to these features in the specific heat. This result and the relatively simple structure of Teflon rule out independent localized oscillators as the source of the maximum in C/T^3.

33735 **(ORNL-tr—5120) Activity of catalysts in polyurethane synthesis.** Olczyk, W. Translated from *Organika ;* **26**: No. 8, 9(1979). Contract AC05-84OR21400. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84010369. DE84010369

Portions are illegible in microfiche products.

The paper deals with the activity of catalysts used in polyurethane technology. The methods employed to determine this activity are discussed and the mutual noncomparability of these methods is indicated. A more universal method of assessing this activity,

based on the viscosity increase in test reactions, is proposed. The influence of some factors that affect catalyst activity is presented with examples.

33736 **(AD-A—137231/7) Particle scattering studies on foreign ions in superionic conductors. Technical report.** Roth, W.L.; Benenson, R.E.; Ji, C.; Wielunski, L.; Dunn, B. (State Univ. of New York, Albany (USA). Dept. of Physics). 21 Dec 1983. 26p. (TR—1). NTIS, PC A03/MF A01.

The effects of foreign ions on the structures and properties of superionic conductors are being investigated. This paper reports Rutherford backscattering, nuclear reaction analysis, and channeling studies on NaBeta-alumina crystals doped with Mn by ion implantation and with Li and Mg from melts. Implantation disorders the NaBeta-alumina surface. On heating, the surface crystallizes, and Mn diffuses into Al sites. The melt-doped compositions are accounted for by Mg substitution in the spinel layer and by Li in the conduction plane. Particle scattering has been used to profile sodium and impurities in NaBeta-alumina ceramics and F disorder in Beta-PbF2.

33737 **(AD-A—139974/0) Corrosion control for reinforced concrete.** Torigoe, R.M. (Florida Univ., Gainesville (USA). Dept. of Civil Engineering). 1983. 101p. NTIS, PC A06/MF A01.

The National Bureau of Standards has recorded that in 1975 the national cost of corrosion was estimated at $70 billion. Approximately 40 percent of that total was attributed to the corrosion of steel reinforcements in concrete. Though concrete is generally perceived as a permanent construction material, cracking and spalling can occur when corrosion of steel reinforcements progresses to an advanced stage. This problem frequently occurs in reinforced concrete highway bridge decks, wharves, piers, and other structures in marine and snowbelt environments. Since concrete has a very low tensile strength, steel reinforcements are added to carry the tensile load of the composite member. Corrosion reduces the effective diameter of the reinforcements and, therefore, decreases the load carrying capability of the member. Though the corrosion process may occur in various forms and may be caused by different sources, the ultimate result is still the failure of the reinforced concrete.

33738 **(DOE/ER/10416—5) Nuclear magnetic resonance studies of ion motion in solid electrolytes. Annual report, April 1, 1983-March 31, 1984.** Bjorkstam, J.L. (Washington Univ., Seattle (USA). Dept. of Electrical Engineering). Dec 1983. Contract AT06-79ER10416. 24p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013846.

Progress is reported on the following studies. (1) The microscopic nature of low lying excitations in disordered materials (primarily beta-aluminas and vitreous electrolytes). The focus of this work was to be a comparison of analytical models for phonon-disorder mode interactions with available low temperature NMR relaxation data in the beta-alumina family and borate glasses. (2) Contributions to the phenomenology of the glass transition; our intention in this study was to consider the relationship between thermal stability and conductivity in glass systems through a comparison of NMR data, collected near the glass transition in several borate glasses, with free-volume and liquid-phonon models. Another aspect of the study was an investigation of the relationship between ion diffusion and structural stability. Specific materials investigations have, thus far in the contract year, focused upon borophosphate glasses, and single crystal, powder and dispersed phase samples of lithium iodide monohydrate. The effort has been directed primarily toward phenomenology of the glass transition. (WHK)

33739 **(DOE/ER/10908—3) Studies of magnetism and exchange scattering in solids using synchrotron radiation and spin polarized photoemission. Final technical report, June 1, 1981-May 31, 1984.** Rothberg, G.M. (Stevens Inst. of Tech., Hoboken, NJ (USA). Dept. of Materials and Metallurgical Engineering). Jan 1984. Contract AC02-81ER10908. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013691.

Portions are illegible in microfiche products.

Progress has been made toward developing Spin Polarized EXAFS (SPEXAFS) as a technique for studying magnetism in solids. The first observations have been made of EXAFS by means of photoemission with sufficient data to permit a traditional Fourier-transform analysis of atomic structure. Some of the advantages of photoelectron detection of EXAFS are: (1) vuv light may be used thereby extending greatly the useable range of photon energies; (2) the number of elements that may be studied for surface EXAFS is increased; (3) the possibility exists for measurements that cannot be done in other ways. In addition to its intrinsic interest, this result is crucial to the study of the spin dependence of EXAFS. These measurements were carried out on the vuv storage ring at the National Synchrotron Light Source. Data obtained on the spin dependence of EXAFS in MnF_2 at room temperature tentatively show dependence of the Mn absorber atom phase shift on the exchange interaction within the absorber atom. This effect has not been discussed theoretically. Preliminary observations have been made of the Fano resonance in Mn 3d photoemission at the 3p to 3d threshold.

33740 **(DOE/ER/45038—1) X-ray spectroscopy of solids under pressure. Annual progress report, August 1983-July 1984.** Ingalls, R.L. (Washington Univ., Seattle (USA). Dept. of Physics). 23 Mar 1984. Contract AT06-83ER45038. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013790.

Portions are illegible in microfiche products.

X-ray absorption studies of several materials as a function of pressure have been performed. Of particular interest has been the EXAFS (extended x-ray absorption fine structure) and XANES (x-ray absorption near edge structure). Materials studied include the alkali halides, NaBr and RbCl, zinc blend semiconductors ZnSe and CuBr and mixed-valence materials SmS and SmSe. In the former, the volume dependence of bond lengths and their mean square fluctuations were determined from the EXAFS. In the latter materials the XANES exhibited the pressure induced change from the Sm^{2+} configuration to Sm^{3+}.

As earlier works on simple polar crystals have shown, the Raman intensities of polar modes are to some extent determined by nonlinear optical properties; however, only very few investigations have been performed on more complicated crystals. In the theoretical part of this thesis the most important phenomens of Raman scattering in piezoelectric crystals, such as Polariton- and direction dispersion, and their relations to nonlinear optics are derived in a uniform way. These considerations lead to an equivalence between Raman scattering and anharmonic mixing of optical frequencies in the infrared region. Also a method was developed to determine the signs of the Raman tensor and nonlinear optical properties, such as electrooptic and SHG-coefficients from a quantitative Raman analysis alone. In the experimental part of this work a complete quantitative Raman analysis is given for the orthorhombic crystal $LiGaO_2$, which has 16 atoms per unit cell. One main aspect of the experiments was to find practical arrangements, which allow to perform the measurements, especially the direction dispersion, with only one sample with dimensions of few millimeters. The considerations of the theoretical part of this thesis were applied to the Raman- and nonlinear optical data of $LiGaO_2$ as well as to the published data of $LiNbO_3$. In both materials a good agreement between theory and experiment is found within the accuracy of the measurements. (Author).

33750 (INIS-mf—8952) **Study of the ^{23}Na EFG (Electrostatic Field Gradient) tensor on single crystals of $Na_2S.9H_2O$ by wideline NMR.** Miksche, G. (Technische Univ., Vienna (Austria)). 1982. 111p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84780337.

The quadrupole coupling constant 'e²qQ/n' of ^{23}Na has been determined by measuring single crystals of $Na_2S.9H_2O$ at room temperature. A value of 687.5 +- 1.2 kHz was found. The asymmetry parameter eta = (qsub(x'x') - qsub(y'y')) / qsub(z'z') of the efg-tensor is zero, there is axial symmetry. The principle axis of the efg-tensor runs parallel to the main crystallographic axis c, the value of the main component of the efg-tensor in c-direction is 171.875 +- 0.6 kHz. The longitudinal relaxation time T_1 has been evaluated as 1.8 s. On this account, the mean distance between two Na-atoms has been determined by measuring the splitting of the central line due to dipole-dipole interaction. The Na-Na distance was found with 0.36 +- 0.007 nm. This value is in good agreement with results from neutron diffraction studies. It was not possible to determine direction and length of hydrogen bonds by NMR-results. A method of growing single crystals of $Na_2S.9H_2O$ of demanded size and purity has been described. Constructional details and technical data of a self-made wideline-NMR-spectrometer are added in an appendix. (Author).

In Physics of radiation damage and radiation material science.

A new mode of synthesis and treatment of glasses gamma-irradiated with ^{60}Co (dose 1000...4200 R/s) is considened. Radiation-optical characteristics of alkali-borate glasses of compounds $XR_2O(1-X)B_2O_3$ (X=0.8, 12, 18, 22, 28, 30, 35 mol. %, R=Na, K) with the additions of transition elements of Cu, Ni, Fe are studied. The relative variations of absorption spectra (lambda=260...1200 nm) photoluminescence and EPR (lambda=3.2s) are defined. The obtained data show the possibility of improvement of radiation and chemical resistance of optical materials.

33752 (INIS-SU—222, pp 68-69) **Radiation-induced diffusion of gold on silicon surface.** Gerasimov, A.B.; Kuteliya, Eh.R.; Melkadze, T.Eh.; Tsertsvadze, A.A. 1982. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780272.

In Physics of radiation damage and radiation material science.

The radiation-induced surface diffusion (RISD) of gold on silicon is studied. Silicon monocrystal of n-type with a specific resistance of rho approximately 0.02 w and dislocation density appr. 10^7 m^{-2} was chosen for the study. T e diffusion was carried out on three surface planes (100), (110), (111). The diffusion was studied in three regimes: a) at approximately 900 K, b) at approximately 330 K plus irradiation, c) at approximately 900 K. The diffusion rate was evaluated by a shift of gold film boundary under fixed experimental conditions. A conclusion was drawn from the results obtained, that a decisive role in radiation-induced sUrface diffusion played chemical bonds of a diffUsant with adjacent atoms of silicon crystal.

33753 (INIS-SU—222, pp 74-76) **Isothermal annealing of tritium from the irradiated LiF crystals with different faulty structures.** Timofeeva, Eh.E.; Ulanovskij, F.N. (AN Gruzinskoj SSR, Tbilisi. Inst. Fiziki). 1982. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780272.

In Physics of radiation damage and radiation material science.

Tritium release at isothermal annealing (773 K) out of reactor irradiated monocrystal of lithium fluoride was studied. Irradiation was carried out both at 123 K and at 293 K. The dependence of effective tritium diffusion coefficient on concentration F-centers and dislocations implanted in crystal was received. As a result of thermal annealing of crystals with different F-centers and disloca-

tion concentration the time dependences of the tritium activity was obtained. To explain the obtained data a model of tritium interaction with crystal lattice defects is offered.

33754 (INIS-SU—222, pp 77-78) **Radiation transformation in aluminium yttrium garnet crystals irradiated in nuclear reactor.** Grigoryan, A.Kh.; Emel'yanov, K.A.; Nadirashvili, L.Sh.; Sarkisov, V.Kh. (AN Gruzinskoj SSR, Tbilisi. Inst. Fiziki); Tsetskhladze, T.V. 1982. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780272.

In Physics of radiation damage and radiation material science.

The results of study of generation characteristics of $Y_3Al_5O_{12}:Nd^{3+}$ crystals irradiated in nuclear reactor were obtained by methods of optical absorption and microcalorimetry. The self-absorption band edge displacement of the crystals to the lons-wave side after (n, γ) irradiation is shown, This displacement occurs due to the radiation-induced defects in the solid matrix. The presence of short-lived defects in the irradiated crystals annealed up to 300 K by microcalorimetry methods is shown. Three ranges of heat evolution in the interval of 77-300 K for the samples irradiated with the fluence of 10^{18} n/cm^{-2} at 77 K are shown. An increase of radiation stability of $Y_3Al_5O_{12}$:Nd:Cr in comparison with $Y_3Al_5O_{12}:Nd^{3+}$ crystals under the same irradiation conditions is found. An improvement of generation characteristics of crystals under n, γ-irradiation with posterior annealing is observed. Hence, the possibility of the irradiation and then annealed $Y_3Al_5O_{12}:Nd^{3+}$ crystals application in laser installation is shown.

33756 (LA-UR—83-2489) **Mechanisms of electrical conductivity in olivine.** Schock, R.N.; Duba, A.G.; Shankland, T.J. (Los Alamos National Lab., NM (USA); Lawrence Livermore National Lab., CA (USA)). 1984. Contract W-7405-ENG-36. 13p. (CONF-840820—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE83017313.

From 27. international geological congress; Moscow, USSR (4 Aug 1984).

Data on the electrical conductivity and the thermoelectric effect in single crystals indicate that the charge conduction mechanism in pure magnesium forsterite is electrons. The concentration of electrons can be varied by controlling the number of oxygen vacancies through manipulation of the oxygen pressure. For iron bearing olivine, the conduction mechanism is by electron holes localized on an iron ion. Since iron strongly affects the creep process as well, oxidation of iron is probably accompanied by the production of magnesium vacancies. 15 references.

33757 (LA-UR—84-1017) **Magnetic susceptibility, electrical resistivity, and specific heat of single crystal $LaFe_4P_{12}$.** Meisner, G.P.; Stewart, G.R.; Torikachvili, M.S.; Maple, M.B. (Los Alamos National Lab., NM (USA); California Univ., San Diego, La Jolla (USA). Inst. of Pure and Applied Physical Sciences). 1984. Contract W-7405-ENG-36. 3p. (CONF-840842—7). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84009979.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

The temperature dependence of the magnetic susceptibility and electrical resistivity, and the low temperature specific heat have been measured on single crystals of $LaFe_4P_{12}$. The data confirm both the occurrence of bulk superconductivity at 4.1°K and the absence of any magnetic ordering. $LaFe_4P_{12}$ is a relatively weakly coupled superconductor ($\lambda = 0.45$) and has a density of states at the Fermi energy of 0.98 states/eV-atom. The electrical resistivity exhibits metallic behavior and has a residual resistance ratio of ~ 90. The magnetic susceptibility is very weakly temperature dependent, saturating below 50°K at a value of 8.0×10^{-4} cm^3/mole.

33758 (LA-UR—84-1202) **Electrical resistivity of rare earth iron phosphides.** Torikachvili, M.S.; Maple, M.B.; Meisner, G.P. (California Univ., San Diego, La Jolla (USA). Inst. of Pure and Applied Physical Sciences; Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 3p. (CONF-840842—14). NTIS, PC A02; 3; GPO Dep. Order Number DE84011413.

From 17. international conference on low temperature physics; Karlsruhe, F.R. Germany (15 Aug 1984).

Paper copy only, copy does not permit microfiche production.

The electrical resistivity rho of the rare earth iron phosphides $REFe_4P_{12}$ (RE = La, Ce and Pr) has been determined as a function of temperature T. Although isostructural, the behavior of rho (T) is remarkably distinct for these three compounds. While $LaFe_4P_{12}$ is superconducting, $CeFe_4P_{12}$ exhibits a semiconductor-like behavior, and $PrFe_4P_{12}$ exhibits a feature at low temperatures that could be related to a combined structural and magnetic transition.

33759 (LBL—17825) **Study of hot phonons and hot carriers in GaAs under picosecond optical pulse excitation.** Collins, C.L. (Lawrence Berkeley Lab., CA (USA)). Apr 1984. Contract AC03-76SF00098. 144p. NTIS, PC A07/MF A01; GPO Dep. Order Number DE84013243.

Thesis.

The ability of light scattering techniques to determine simultaneously many of the important properties of photoexcited electron-hole plasmas in GaAs was demonstrated. Scattering due to plasmons or coupled LO-plasmon modes can be used to determine the plasma density provided the spatial profile of the density is known. The distribution function and the drift velocity of the plasma in the direction of the laser beam can be determined from the SPE spectra. The fact that the plasma density can be determined independently of the distribution function enabled me to show that the electron distribution function in high density EHP in GaAs is nonthermal equilibrium within ~ 20 psec of excitation. This conclusion is consistent with previous experiments on photoexcited EHP in GaAs using picosecond lasers, although the form of the nonequilibrium distribution was not determined in the earlier measurements. At the moment there is very little information on the properties of transient high density EHP in semiconductors so it is too early to derive theoretical justifications for the power law distribution functions I deduced. However, one may speculate that this may have something to do with the slowing of hot carrier relaxation by emission of LO phonons due to screening of the Froehlich interaction. Also the rapid expansion of the EHP may have important consequence on the thermalization of the EHP.

33760 (N—8418401) **Shock temperatures in anorthite glass.** Boslough, M.B.; Ahrens, T.J.; Mitchell, A.C. (California Inst. of Tech., Pasadena (USA)). 1983. 33p. (NASA-CR—173364). NTIS, PC A03/MF A01.

Temperatures of CaAl2Si2O8 (anorthite glass) shocked to pressures between 48 and 117 GPa were measured in the range from 2500 to 5600 K, using optical pyrometry techniques. The pressure dependence of the shock temperatures deviates significantly from predictions based on a single high pressure phase. At least three phase transitions, at pressures of about 55, 85, and 100 GPa and with transition energies of about 0.5 MJ/kg each (approximately 1.5 MJ/kg total) are required to explain the shock temperature data. The phase transition at 100 GPa can possibly be identified with the stishovite melting transition. Theoretical models of the time dependence of the thermal radiation from the shocked anorthite based on the geometry of the experiment and the absorptive properties of the shocked material yields good agreement with observations, indicating that it is not necessary to invoke intrinsic time dependences to explain the data in many cases.

33761 (NP—4770328) **Distribution of humidity in porous materials as a consequence of non-steady water-vapour diffusion.** Husseini, F. (Dortmund Univ. (Germany, F.R.)). 21 Jun 1982. 151p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84770328.

Portions are illegible in microfiche products.

In order to prevent damage of buildings and constructions, methods were developed to calculate diffusion and dew water formation in components. The most widely known methods however, adopt a steady-state view of the problem and do not take typical seasonal or temporal periods of the outside climate into account. This thesis contains a simple calculation method which considers these variations i.e. it is a calculation method for non-steady water vapour diffusion processes.

33762 **(PB—84-179498) Beneficial use of sludge in building components.** Alleman, J.E. (Purdue Univ., Lafayette, IN (USA). School of Civil Engineering). Dec 1983. 112p. NTIS, PC A06/MF A01.

Results are presented of a study in which sludge was introduced in the manufacture of brick. More than 300 bench-scale, sludge-amended bricks were produced with initial volumetric sludge additions of from 16% to 50%. These specimens looked, felt, and smelled like standard bricks, and those with sludge additions of 30% or less were found capable of meeting the appropriate technical standards. Three full-scale runs have been completed by a commercial manufacturer, and almost one million bricks have been produced. These bricks were found comparable to normal, unadulterated bricks; in fact, the incorporation of sludge was believed to be beneficial due to related improvements in the brick's water absorption properties. The name 'biobrick' is used to refer to the new product.

33763 **(UCRL—90866) Review of ultraviolet damage threshold measurements at Lawrence Livermore National Laboratory.** Lowdermilk, W.H.; Milam, D. (Lawrence Livermore National Lab., CA (USA)). 1984. Contract W-7405-ENG-48. 22p. (CONF-8404124—8). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012956.

From SPIE technical symposium; Arlington, VA, USA (29 Apr 1984).

Portions are illegible in microfiche products.

The results of damage threshold measurements made at LLNL using ultraviolet wavelength laser pulses are reviewed. Measurements were made with pulses from a krypton fluoride laser with wavelength of 248 nm and pulse duration of 20 ns and with Nd-glass laser pulses converted to the third harmonic wavelength of 355 nm with duration of 0.6 ns. Measurements are presented for transparent window materials, crystals and harmonic generation, single layer dielectric films of oxide and fluoride materials and multilayer high reflectivity and antireflective coatings.

33764 **Heatpulse annealing of ion-implanted silicon: structural characterization by transmission electron microscopy.** Sadana, D.K. (Lawrence Berkeley Lab., CA (USA)); Shatas, S.C.; Gat, A. (AG Associates, Palo Alto, CA (USA)). *Institute of Physics, Conference Series;* 143-148(1983). (CONF-8303121—). Contract AC03-76SF00098.

From Microscopy of semiconducting materials meeting; Oxford, UK (21 Mar 1983).

A detailed structural investigation of Heatpulse rapid thermal annealed ion-implanted Si was carried out using TEM. Defect-free material was obtained after an 1100 deg C/10 sec. anneal for 80 keV 2 x 10^{15} ^{75}As implanted Si, while dislocation loops were still present after lower temperature anneals. When compared with arsenic, 35 keV ^{11}B implanted Si in the dose range 5 x 10^{14} exhibited markedly different behavior under the same annealing conditions, in that residual defects in the form of line dislocations, loops, and rods were observed. Comparison with 1000 deg C/30 min. furnace annealed samples showed differences in defect structures and impurity redistribution behavior as revealed by SIMS measurements. A model explaining the annealing behavior of implanted layers in silicon under rapid annealing conditions is proposed.

33765 **A technique for measuring the apparent thermal conductivity of flat insulations.** Moore, J.P.; Jury, S.H.; McElroy, D.L. (Metals & Ceramics Division Oak Ridge National Lab. Oak Ridge, TN 37830). pp 727-735 of Thermal conductivity. Vol. 17. Hust, J.G. New York, NY; Plenum Publishing Corp. (1983). (CONF-8106164—). Contract W-7405-ENG-26.

From National Bureau of Standards joint conferences: 8. symposium on thermophysical properties; 17. thermal conductivity conference; 8. thermal expansion conference; Gaithersburg, MD, USA (15 Jun 1981).

This chapter tests a simple concept for measuring thermal conductivity of flat insulations as a function of density and temperature, and compares results with studies on a pipe insulation tester. Explains that the technique consists of a flat Nichromescreen wire sandwiched between two samples and heated electrically. Shows through thermal modelling of this system that accurate measurements can be achieved with thermal conductivity down to 0.01 W/mXK and insulation thicknesses below 0.089 m (3-1/2 in.). Points out that measurement of thermal conductivity for material as thick as 0.305 m (12 in.) should also be possible with a lateral guard scheme to reduce heat flow along the screen wire heater.

33766 **EM study of the structure and composition of grain boundaries in (Mn,Zn) Fe_2O_4.** Lin, I.N.; Mishra, R.K.; Thomas, G. (Dept. of Materials Science and Mineral Eng., and the Materials and Molecular Research Division Univ. of California Berkeley, CA 94720). pp 351-358 of Advances in materials characterization. Vol. 15. Rossington, D.R.; Condrate, R.A.; Snyder, R.L. New York, NY; Plenum Publishing Corp. (1983). (CONF-820891—). Contract AC03-76SF00098.

From 18. ceramic science conference on advances in materials characterization; Alfred, NY, USA (16 Aug 1982).

This chapter examines the use of electron diffraction and microscopy studies supplemented by electron spectroscopic techniques such as Auger electron spectroscopy and energy dispersive x-ray spectroscopy to characterize the nature of grain boundary segregation in commercial grade (Mn, Zn)Fe_2O_4 samples containing small quantities of CaO. Finds that convergent beam electron diffraction experiments show that the crystal symmetry of the spinel structure is distorted in the vicinity of the grain boundary; that in-situ heating experiments in high voltage electron microscopy (HVEM) show the existence of a disordered phase at the sintering temperature; and that Lorentz microscopy in transmission electron microscopy (TEM) shows the interaction of magnetic domain wall motion with grain boundaries. Correlates these chemical and structural features with electrical resistivity and magnetic permeability of the ferrites.

33767 **Design criteria for prestressed concrete reactor vessels for high-temperature reactors.** Elter, C.; Becker, G. (Hochtemperatur-Reaktorbau GmbH, Gottlieb-Daimler-Strasse 8 6800 Mannheim 1). *Nuclear Technology;* **59**: No. 2, 228-233(Nov 1982).

For the design and construction of prestressed concrete reactor vessels, data on loading, construction materials, and safety factors are required. A description is given of the design conditions according to the current state of technology in the Federal Republic of Germany. Special consideration is given to the allowable stresses and an appropriate proposal for such stresses is suggested.

33773 **(DOE/ER/04471—4) Dynamics of heat, mass and momentum transfer in an inductively coupled plasma. Final report, August 2, 1982-November 30, 1983.** Barnes, R.M. (Massachusetts Univ., Amherst (USA). Dept. of Chemistry). 23 Mar 1984. Contract AC02-77ER04471. 16p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84014121.

In the present research special attention has been given to the development of sophisticated mathematical models for the calculation of the flow and temperature fields in the induction torch under different operating conditions. The model originated by Boulos is particularly valuable since it is the only one which gives detailed information about the flow field as well as the temperature field in the plasma discharge through the solution of the two-dimensional flow and energy equations simultaneously with the one-dimensional electric and magnetic field equations. This model has been extended and refined substantially during the current research investigation, and its improvement and application to more complex practical conditions such as turbulent flow conditions and non-equilibrium processes is to be undertaken in new research.

33774 **(DOE/ER/04471—T2) Dynamics of heat, mass and momentum transfer in an inductively coupled plasma. Final report.** Boulos, M.I. (Sherbrooke Univ., Quebec (Canada). Dept. of Chemical Engineering). 24 Feb 1984. Contract AC02-77ER04471. 12p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013499.

Objective over the last six years was to improve the understanding of the inductively coupled rf plasma which is used as an emission source in spectrochemical analysis. A brief overview is given of the research accomplishments. (DLC)

33775 (DOE/METC—84-8, pp 273-280) **Separation of gas mixtures by supported complexes.** Nov 1983. NTIS, PC A18/MF A01. Order Number TI84000217. (CONF-830641—).

From 3. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (28 Jun 1983).

The objective of this study is to define the most advantageous materials (both complex and support), methods of material preparation, material properties, and the performance of feasible supported complex systems in applicable gas separations. The project is well under way with the synthesis of 14 coordination complexes. Many of these complexes have been examined for their ability to reversibly sorb CO_2, CO, or H_2. The most promising complex so far has been $[Pd_2(dpm)_2Cl_2]$ where dpm = bisdiphenylphosphinomethane. The material has an exceedingly quick uptake of carbon monoxide. The rate of sorption is unaffected by the presence of other gases such as CO_2, H_2, N_2, and O_2. Further, the CO can be reversibly removed from the complex by the application of vacuum or heat (80°). Thus, it appears to be an excellent candidate for the selective removal of CO from a medium Btu gas stream. Attachment of procedures are nearing completion which will allow the respective complexes to polymeric supports. Polymeric attachment may enhance cycling life and delay complex degradation. 4 references, 3 figures, 1 table.

33776 **(INIS-BR—117) Determination of boron in water solution by an indirect neutron activation technique from a ^{241}Am/Be source.** Sales, H.B. (Pernambuco Univ., Recife (Brazil). Dept. de Energia Nuclear). Aug 1981. 71p. (In Portuguese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84780334.

Boron content in water solutions has been analysed by Indirect Activation Technique a twin ^{241}Am/Be neutron source with a source strength of $9x10^6$ n/seg. The boron concentration was inferred from the measurement of the activity induced in a vanadium flux monitor. The vanadium rod was located inside the boron solution in a standard geometrical set up with respect to the neutron source. Boron concentrations in the range of 100 to 1000 ppm were determined with an overall accuracy of about 2% during a total analysis time of about 20 minutes. Eventhough the analysis is not selective for boron yet due the rapid, simple and precise nature, it is proposed for the analysis of boron in the primary coolant circuit of Nuclear Power Plants of PWR type.

33799 (INIS-mf—8945) **Fast transport facility for activation analysis with high-energy neutrons.** Salahi, A. (Technische Univ., Vienna (Austria)). 1982. 96p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84780335.
In 1981 Dams and Fanger have shown that for neutron activation analysis nearly all elements have potential short-lived nu-

clides, where different irradiation techniques are applied. To increase the range of analytical application the activation can be performed also with 14 MeV neutrons to obtain a higher sensitivity for a number of interesting elements like O, Si, P, K, As, Y, Ba and Pb. To utilize a high neutron flux density for fast and thermal neutron activation analysis with short-lived radionuclides a rapid He-transfer system has been developed for the central thimble of the TRIGA Mark-II reactor at the Atomic Institute of Austrian Universities, Vienna, Austria. The rapid transfer system is provided with a ^{6}LiD-converter in the irradiation position. In this system a special stopping device is inserted at the counting position. The capsules are injected into the transport tube by means of an automatic capsule changer and the irradiation sequence is controlled by a micro-computer. With a reproducibility of less than 1 ms transfer times of 32 to 35 ms have been obtained over a distance of 8.5 m for gas-tube pressures of 0.8 to 1 MPa.

33800 **(INIS-mf—8956) Quantization of secondary ion mass spectrometry (SIMS) data using external and internal standards.** Gnaser, H. (Technische Univ., Vienna (Austria)). 1983. 153p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84780390.

Some aspects of multi-dimensional characterization of solids by secondary ion mass spectrometry (SIMS) are given. A theoretical part discusses methods for the quantization of SIMS data and the most prominent effects of ion-solid interactions as related to SIMS. After a description of the instrument used for experiments (a quadrupole-equipped ion microprobe featuring a liquid metal ion source in addition to the standard duoplasmatron gas ion source) the first experimental section is devoted to the determination of practical sensitivities and relative sensitivity factors for selected pure elements, binary and treary alloys and multicomponent systems. For 23 pure elements practical sensitivities under O^{+}_{2} bombardment also have been compared to those under In^{+}-bombardment; it was shown that on oxygen saturated surfaces yields under In^{+}-bombardment are higher, this making feasible use of submicron In-beams for surface analysis. In the second experimental section boron implants in silicon have been used for studying depth profiling capabilities of the instrument. Sputtering yields of Si and degrees of ionization of both B and Si have been measured. It has been shown that implantation profiles may deviate considerably from Gaussian but can be described by means of mathematical distribution functions. In the third experimental section depth resolution of the erosion process has been studied by profiling a Ni/Cr multilayer sample (100 A single layer) and been found to be approximately constant over the depth range investigated. Quantization of depth profiles, usually distorted by matrix effects, has been attempted using the primary beam species (In) as internal implantation standard. Some problems in connection with the conversion of secondary ion micrographs to concentration maps are discussed. Elemental detection limits in multidimensional SIMS analysis are given in dependence of primary beam size and total eroded depth. (Author).

33801 **(INIS-mf—8973) Applications of EHD-ion sources in SIMS.** Studnicka, H. (Vienna Univ. (Austria). Formal- und Naturwissenschaftliche Fakultaet). 1983. 107p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84780349.

Because of their high brillance and their small energy spread EHD ion sources are well qualified for focused ion beams. This work describes the build-up and the main properties of a designed indium EHD ion source. It is used as primary gun in a scanning ion microprobe. The advantages of this new source instead of a O_2 - duoplasmatron ion source are described and demonstrated by selected examples. (Author).

33804 **(IS-M—476) Relation of vertical intensity profiles for neutral atom lines to analyte atomization behavior in inductively coupled plasmas.** Houk, R.S. (Ames Lab., IA (USA)). 1984. Contract W-7405-ENG-82. 15p. (CONF-840101—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84014126.

From Winter conference on plasma spectrochemistry; San Diego, CA, USA (2 Jan 1984).

Emission lines from neutral atoms exhibit their maximum intensities at observation heights that vary considerably from element to element. In this paper, vertical spatial profiles of neutral atom number density are derived from the corresponding experimental intensity profiles using a simple model based on a Boltzmann distribution of excited state populations. These number density profiles indicate that element-to-element differences in the height range in which analyte atomization and ionization occur are partly responsible for the normal temperature phenomenon noted above. The effects of forward power on the range of observation heights in which neutral atom lines peak is also described.

A process for the recovery of plutonium and americium from molten salt extraction (MSE) salt residues has been demonstrated. It is based upon a new chloride anion-exchange process at low acidity that eliminates corrosive HCl fumes. The Los Alamos americium oxide production line has been improved to give more product with a concurrent lowering of personnel radiation exposure. A cost study has been made for the disposal of americium-contaminated calcium metal buttons that were obtained by pyrochemical recovery of plutonium from MSE salts. The waste form used in the study conforms to WIPP-Facility standards and current state-of-the-art radioactive waste disposal. The cost estimate is ~ \$300/g ^{241}Am. Plutonium decontamination factors of ~ 300 have been obtained from lead-platinum alloy dissolution experiments carried out in alumina crucibles using lead oxide slag to getter the plutonium.

33806 **(LBL—16604) Radial distribution function as an analysis technique.** Pearson, A.W. (Lawrence Berkeley Lab., CA (USA)). May 1984. Contract AC03-76SF00098. 70p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013242.

Portions are illegible in microfiche products; Thesis.

Diffraction patterns for Cu as found in a perfect fcc lattice were generated for various particle sizes and shapes using a computer model based on the Debye-Sum. These patterns were Fourier transformed to yield the radial distribution function $G(R) = 4\pi R(\rho(R)-\rho_0)$. This function was studied in relation to five variables, i.e., (1) particle size, (2) particle shape, (3) scattering vector termination, (4) the influence of small angle scattering due to sample size and, (5) effect of vibrational atomic displacements. Particle sizes of up to 30A were found to influence G(R) as related to determination of the first coordination shell. The effect of volume scattering was to displace the G(R) curve negatively, but neither peak position nor area were affected. The measurement of ρ_0 was affected and the effective ρ_0 present with SAXS removed must be taken into account when calculating coordination shells.

33807 **(PB—84-181981) Laser micropyrolysis of coal macerals. Annual report Nov 82-Oct 83.** Vastola, F.J.; Bogdan, M. (Pennsylvania State Univ., University Park (USA)). Feb 1984. 72p. NTIS, PC A04/MF A01.

See also PB83-244020.

The mass spectra of the pyrolysis products of coal macerals have been obtained by heating the macerals, in monolithic coal sections with focused laser radiation. The technique has been used for analysis of the vitrain maceral of 27 coals. The pyrolysis mass spectra indicated the presence of alkyl- and hydroxy-substituted benzenes and napthalenes. Higher molecular weight compounds (beginning with substituted anthracenes) were not detected. All of the pyrolysis products can be accounted for by breaking the weakest bonds in a structure and, if sufficient hydrogen was available, abstraction of hydrogen. This model suggests that vitrinite is predominantly composed of many alkyl- and hydroxy-substituted benzenes and naphthalenes linked by aliphatic bridges. The chemical information in the laser pyrolysis mass spectra was examined for possible correlations to rank, vitrinite reflectance, regional variations and other physical parameters. The strongest correlation of the mass spectra regardless of coal region was with the free swelling index of the coals. Coals which swell have an abundance of alkylaromatics as pyrolysis products; those which do not swell were void of alkylaromatics. The formation of alkyl-aromatics was attributed to the pyrolysis of aliphatic bridges between aromatic nuclei. An inverse relationship was also detected between the pyrolysis product 2-propenal (acrolein) and the free swelling index of the coal.

33808 **(PB—84-182203) Coadsorption studies on transition metals. Annual report 1 Jan-31 Dec 83.** Craig, J.H. Jr. (Nebraska Univ., Omaha (USA)). Mar 1984. 16p. NTIS, PC A02/MF A01.

Surface mass spectroscopy was used to study adsorption and coadsorption of active gases on several transition metals. Electron and ion stimulated desorption were employed in conjunction with thermal desorption spectroscopy. It was found to be possible to correlate specific adsorption states for CO on nickel with release of particular ionic species by electron and ion impact. For coadsorbed H_2 and CO on nickel, an $(NiOH)^{+1}$ species was observed by ion induced desorption which was interpreted as evidence for interaction between adsorbates. Coadsorption of H_2 and CO on rhodium resulted in appearance of a new high temperature mass 2 thermal desorption state. Electron desorption of $(OH)^{+1}$ along with modification of the $(O)^{+1}$ energy distribution during coadsorption indicated presence of a strong interaction between adsorbed H_2 and CO.

33809 **(PNL-SA—12032) Separation of gas mixtures with coordination complexes.** Nelson, D.A.; Hallen, R.T.; Lilga, M.A. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1984. Contract AC06-76RL01830. 13p. (CONF-840828—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84008314.

From International synfuels policies and technologies symposium; Philadelphia, PA, USA (19 Aug 1984).

Several coordination complexes were examined for their ability to reversibly sorb CO_2, CO, or H_2. Three of those complexes appeared worthy of further investigation. Carbon dioxide was rapidly bound by crystalline $IR(dmpe)_2Cl$ within 10 seconds. Desorption of CO_2 was achieved with heat and decreased pressure. The series $Pd_2(dpm)_2X_2$, where X = Cl, Br, I, and NCO, was found to be of considerable interest for CO sorption. Sorption of CO was rapid and the kinetics appeared to be quite favorable. The kinetics were not influenced by the presence of CO_2, N_2, O_2, H_2, ethylene or acetylene. Thus, $Pd_2(dpm)_2X_2$ showed considerable specificity for CO. Hydrogen, oxygen, and carbon monoxide were sorbed by $Ru(CO)_2(PPh_3)_3$; however, the complex required that a phosphine ligand be released prior to gas coordination. The kinetics of these reactions indicated that H_2 was bound twice as fast as CO and seven times faster than O_2.

33810 **(ORNL-tr—5125) Separation of volatile elements and oxides: thermochromatography and the use of chemical filters.** Zhuykov, B.L. (Oak Ridge National Lab., TN (USA); Joint Inst. for Nuclear Research, Dubna (USSR)). 1984. Contract AC05-84OR21400. C; P12-82-63, 1982. 27p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012869.

Portions are illegible in microfiche products.

The possibilities of gas-chemical separation of elements of the periodic system by alternation of gas phase composition (hydrogen,oxygen), temperature (thermochromatography, a moving temperature gradient) and composition of stationary phase (quartz, stainless steel, gold, calcium oxide) are considered. Thermochromatographic separation of numerous elements in hydrogen or oxygen stream is performed in a carrier-free state and in the presence of a carrier up to milligram quantities. Adsorption heat on different surfaces is calculated. Absorption of volatile in oxygen stream elements by a CaO filter (1100°C) is examined. Complete absorption of F, As, Sb, Bi, Te, Po, In, Mo, Tc, Ru; partial absorption of Re, Rh, Ir, Pt; practically no absorption of Br, I, At, Se, Pb, Tl, Zn, Cd, Hg, Os are observed. Complete separation of At and halogens by thermochromatography on CaO is achieved. The use of these methods in different fields of radiochemistry is discussed. The investigation has been performed at the Laboratory of Nuclear Reactions, JINR.

33811 **Gas-absorption process.** Stephenson, M.J.; Eby, R.S. (to Dept. of Energy). Canadian Patent 1,090,539. 2 Dec 1980. Priority date 18 Jul 1977, United States of America (USA), vp.

Gas-absorption processes (i.e., processes in which a gas mixture is contracted with a liquid absorbent (solvent) for preferentially dissolving one or more components of the mixture are described. More particularly, continuous gas-absorption processes are provided in which a liquid absorbent is circulated continuously through a closed-loop system which includes gas-absorption, gas-desorption, and absorbent-regeneration zones. 10 claims.

33812 **(CONF-840415—25) Intramolecular dynamics of highly excited OCS.** Davis, M.J.; Wagner, A.F. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 19p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013444.

From 187. national meeting of the American Chemical Society; St. Louis, MO, USA (8 Apr 1984).

The intramolecular dynamics of highly excited OCS has been studied within the framework of classical mechanics. One study involves the energy relaxation of OCS restricted to planar geometry. A second study investigates the unimolecular dissociation of OCS. It has been found that the relaxation of OCS is slow and appears to occur on two time scales. In addition, the relaxation still persists at 45 ps. Reasons for such an effect, as well as diagnostic techniques, are discussed. Since the causes for such effects persist above dissociation, they lead to nonstatistical unimolecular dissociation, which also shows a high degree of mode specificity.

33813 **(DOE/PC/60812—T1) Catalysts possessing augmented C-O and C-N hydrogenolysis activity. Preliminary progress report, August-September 1983.** Massoth, F.E.; Shabtai, J.S. (Utah Univ., Salt Lake City (USA). Dept. of Fuels Engineering). 31 Oct 1983. Contract FG22-83PC60812. 7p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012968.

The aim of the proposed research is to synthesize and investigate new sulfided catalyst systems having higher carbon-heteroatom hydrogenolysis activity as compared to ring hydrogenation activity. A fundamental approach is planned to gain understanding of the basic catalytic properties which relate to hydrogenolysis, hydrogenation and cracking functions of the catalysts. This will involve preparation of new catalysts, characterization of their properties and model compound reactivity studies. In another part of the project, selected catalysts will be applied in studies of more complex O- and N-containing model compounds with the objective of providing fundamental data on the stereochemistry of HDO and HDN reactions. These data will be used to develop steric surface-reactant models for sulfided catalysts. These new catalysts should be of particular importance for upgrading of coal-derived liquids and solids, as well as other heavy feedstocks. The research is divid-

ed into four tasks: (1) catalyst preparation and activity testing; (2) catalyst characterization; (2) study of catalyst activity under hydroprocessing conditions; and (4) stereochemical studies. This report covers a period of only one month. Work was initiated on catalyst preparation. A brief literature search was made to ascertain what different preparation methods can be applied to supported sulfide catalysts besides the standard wetness method. Several Cr/Al_2O_3 catalysts containing Co or Ni were prepared by the standard impregnation method. 3 references.

33814 **(EGG-SCM—6567) Dehydration of aluminum chloride hexahydrate: a technical assessment.** Miller, R.L. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1984. Contract AC07-76ID01570. 48p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013086.

Physical and chemical properties of aluminum chloride hexahydrate, ACH, and related compounds are noted as well as the relation of these properties to the problem of dehydration of ACH to form anhydrous aluminum chloride. Several approaches to the dehydration of ACH are discussed and a rationale or each approach is given: solvent extraction, ligand exchange, azeotropic distillation, chemical dehydration, and energy specific direct heating. While the thermodynamics of dehydration are frequently favorable, the rate of reaction and the mechanisms of reaction are more frequently unfavorable. However, each approach requires experimentation to test its effectiveness. The stability of the aluminum-oxygen bond in the hydrate is such that dehydration without decomposition to the oxide will be very difficult.

Over 40 new and remarkable types of metal-rich compounds have been synthesized since about 1970 by high temperature reactions. These are found in binary and ternary systems of the early (group III-VI) transition and lanthanide elements with the nonmetals Cl, Br, I, O, S, Se or Te. Metal-metal bonding is characteristic of all the structures. These are conveniently organized in terms of the presence of discrete clusters of four to six metal atoms or their condensation products in the form of extended clusters, infinite chains of clusters sharing faces or edges, or double-metal-layered sheets. All the metal structures are well bound by nonmetals in relatively specific ways. Several recent discoveries also involve small nonmetal atoms interstitially bound within the metal units. A range of examples is discussed and illustrated. Some developing concepts and principles involving structural, bonding and electronic regularities and effects and some of the experimental aspects are also considered.

33817 **(LA-UR—84-1041) Selective epoxidation of ethylene catalyzed by silver. Mechanistic details revealed by single-crystal studies.** Campbell, C.T. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 16p. (CONF-840805—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84009987.

From 188. meeting of the American Chemical Society; Philadelphia, PA, USA (26 Aug 1984).

The selective oxidation of ethylene to ethylene epoxide ($C_2H_4 + 1/2\ O_2 \rightarrow C_2H_4O$) over Ag is a simple prototype for the entire class of kinetically-controlled, selective oxidation reactions. We have studied the steady-state kinetics and selectivity of this reaction on clean, well-characterized single-crystal surfaces of silver by using a special apparatus which allows rapid (approx. 20 s) transfer between a high-pressure catalytic microreactor and an ultra-high vacuum surface analysis (AES, XPS, LEED, TDS) chamber. The results of some of our recent studies of this reaction are reviewed. These single-crystal studies have provided considerable new insight into: the reaction pathway through molecularly adsorbed O_2 and C_2H_4, the structural sensitivity of real silver catalysts, and the role of chlorine adatoms in promoting catalyst selectivity.

33818 **(PB—84-179746) Experimental studies of the geometric and electronic structure of chemisorption bonding. Annual report Jan-Dec 83.** Gustafsson, T.; Plummer, E.W. (Pennsylvania Univ., Philadelphia (USA). Dept. of Physics). Feb 1984. 17p. NTIS, PC A02/MF A01.

See also PB83-243949.

The chemisorption of small molecules on carefully prepared alloy surfaces has been studied using angle-integrated and angle-resolved photoelectron spectroscopy, as well as with more conventional techniques such as thermal desorption and low energy electron diffraction. The specific system investigated this year was the (110) face of the surface alloy NiAl. Simply stated the objective is to separate or correlate the electronic and geometric factors governing chemisorption on bimetallic systems as a first step towards understanding the selectivity of multi-component catalysts. The chemisorption properties of the NiAl surface are fascinating.

33819 **(DOE/ER/10641—2) Heats of formation of gas phase organosulfur molecules radicals and ions measured by Pipeco. Progress report, August 1981-May 31, 1982.** Baer, T.; Evans, S.A. (North Carolina Univ., Chapel Hill (USA). Dept. of Chemistry). 1982. Contract AS05-80ER10641. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012949.

Portions are illegible in microfiche products.

The O° K heats of formation ($\Delta H°$/sub fo/) in kcal/mol of CHS^+ (233), CH_2S^+ (235), CH_3S^+ (215), $C_2H_3S^+$ (217), $C_2H_4S^+$ (222), $C_3H_5S^+$ (214), and $C_4H_7S^+$ (241) have been measured by dissociative photoionization of a number of precursor molecules. Because the $\Delta H°$/sub fo/ ($C_2H_4S^+$) is significantly lower than the known $\Delta H°$/sub fo/ (c-$C_2H_4S^+$) of 232 kcal/mol, we conclude that the $C_2H_4S^+$ product ion has the thioacetaldehyde structure. Combining this with the known ionization energy of thioacetaldehyde gives us the first experimentally measured heat of formation of the thioacetaldehyde molecule which was found to be 15 kcal/mol at O° K. This compares to a $\Delta H°$/sub fo/ (C_2H_4S) = 23 kcal/mol. Another study involved some of the oxygen analogues of the above sulfur compounds. We have synthesized a new series of vinyloxy sulfides, sulfoxides, and sulfones and have obtained estimates of the π electron distribution at the vinylic carbons using ^{13}C NMR spectoscopy. These results have significant implications regarding the strength of S-C bonds in unsaturated organosulfur molecules capable of exhibiting enhanced stability resulting from $(2p \rightarrow 3d)\pi$ overlap compared to the saturated analogs. An ^{33}S NMR investigation of some of the organosulfur compounds indicate that conversion of sulfenyl sulfur to sulfonyl sulfur (-S- → -SO_2 -) causes the ^{33}S line widths to diminish so that rapid and accurate sulfur analyses (as sulfones) of organosulfur constituents in coal and petroleum are possible.

33820 **(DOE/ER/10641—3) Heats of formation of gas phase organosulfur molecules, radicals and ions measured by PEPICO, and application of ^{17}O and ^{33}S NMR spectroscopy to structure determinations of organosulfur compounds. Progress report, June 1, 1983-April 15, 1984.** Baer, T. (North Carolina Univ., Chapel Hill (USA). Dept. of Chemistry). 1984. Contract AS05-80ER10641. 10p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013131.

A number of fragment ion onsets from the photoionization of $CH_3SCCSCH_3$ and CH_3SSSCH_3 have been measured. In addi-

tion, our experiment has been converted to a molecular beam source which will increase the precision of our measurements. Exhaustive oxidation of the divalent sulfur to sulfonic acids serves to quench the effects of quadrupolar broadening and thereby allowing for quantitative evaluation of structurally similar sulfonic acids. W/ sub 1/2/ are reduced to < 25 Hz at 19 MHz (57,500 Gauss). Electronegative substituents shield the ^{33}S nucleus perhaps imploying more efficient 2p-3dπ backbonding between sulfur and oxygen. α-Hetero substituents of sulfonyl groups do not influence the shift of the ^{33}S to a dramatic extent. The exception is the dianion of thiosulfate compared to the dianion of sulfate. Lanthanide shift reagents, [Eu(fod)$_3$], are potentially useful in distinguishing sulfonyl ^{17}O shifts from those of ethereal ^{17}O shifts.

33821 **(IS-M—473) Reduced molybdenum states in hydrodesulfurization: investigations using Chevrel phase catalysts.** McCarty, K.F.; Schrader, G.L. (Ames Lab., IA (USA)). 1984. Contract W-7405-ENG-82. 10p. (CONF-840748—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012309.

From 8. international congress on catalysis; Berlin, F.R. Germany (2 Jul 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A series of reduced molybdenum sulfides known as Chevrel phases were used as catalysts for thiophene hydrodesulfurization and were determined to have desulfurization activities comparable to model molybdenum sulfide catalysts. Cobalt, iron, copper, and holmium ternary compounds were prepared with unusual promotional activity for holmium and copper. Hydrogenation and cracking activities of all Chevrel phase catalysts were observed to be very low. Characterization by x-ray diffraction, laser Raman spectroscopy, and XPS demonstrated that the catalysts were stable under reaction conditions. Oxidation states for molybdenum less than that for MoS_2 were detected.

33822 **(IS-T—1106) Comparison of the ozonolysis products of the methylnaphthalenes and dimethylnapthalenes in hexane, methanol, and water.** Gaul, M.D. (Ames Lab., IA (USA)). Jun 1984. Contract W-7405-ENG-82. 309p. NTIS, PC A14/MF A01; 1; GPO Dep. Order Number DE84013981.

Portions are illegible in microfiche products; Thesis.

The ozonolyses of 1- and 2-methylnaphthalene and 1,2-, 1,3-, 1,4-, and 2,3-dimethylnaphthalene were performed in dilute aqueous solution, and the products which resulted were compared to products from similar reactions performed in n-hexane and methanol. Gas chromatography, gas chromatography-mass spectrometry, and gas chromatography-Fourier transform infrared spectrometry were used. All products characterized in the three solvents resulted from the normal ozonolysis of either one or two double bonds in the naphthalene ring system. Products resulting from the ozonolysis of two double bonds were typical. Products which resulted from the ozonolysis of only one double bond were not expected. Reactions in water yielded large amounts of these mono-ozonolysis products compared with the reactions in n-hexane and methanol. A second major difference in the aqueous ozonolyses was that these reactions yielded aldehydes and ketones exclusively as products. The reactions in the organic solvents contrasted sharply with the reactions in water by yielding large amounts of carboxylic acids as well as aldehydes and ketones.

33823 **(PB—84-175025) Stoichiometric CO reduction by supported metal carbonyls. Annual report Dec 82-Jan 83.** Shriver, D.F. (Northwestern Univ., Evanston, IL (USA). Dept. of Chemistry). Jan 1984. 11p. NTIS, PC A02/MF A01.

The overall project objective is to study stoichiometric reactions on supported organometallic complexes with emphasis on the reduction of carbon monoxide. Previous work in their laboratory has shown that the homogeneous proton-induced reduction of CO to CH4 in metal carbonyls in neat super acid is greatly dependent on the metal cluster nuclearity. A study of the effect of metal nuclearity on the heterogeneous reduction of CO should provide insight on the physical requirements for CO reduction. Ways to improve product selectivity in this complex reaction may also result from such a study.

33824 **Catalysis by solvated transition-metal cations. 3. Novel catalytic transformations of alkenes by cationic compounds of molybdenum and tungsten.** Sen, A.; Thomas, R.R. (Pennsylvania State Univ., University Park). *Organometallics;* 1: 1251-1254(1982). Contract AC02-81ER10992.

The compounds $[M(NO)_2(CH_3CN)_4](BF_4)_2$; (2, M = Mo; 3, M = W) were synthesized through reactions of the corresponding metal hexacarbonyls with 2 equiv of $NOBF_4$ in acetonitrile. These compounds catalyze the polymerization, oligomerization, and rearrangement of olefins. 13 references, 2 tables.

33825 **Oxygen electrochemistry.** Tarasevich, M.R.; Sadkowski, A.; Yeager, E. (Inst. of Electrochemistry of the Academy of Sciences of the USSR Leninsky Prospekt 31, Moscow V-71). pp 301-398 of Comprehensive treatise of electrochemistry. Vol. 7. Conway, B.E.; Bockris, J.O'M.; Khan, S.U.M.; White, R.E.; Yeager, E. New York, NY; Plenum Publishing Corp. (1983).

This chapter examines oxygen electrochemistry in aqueous systems. Discusses thermodynamics of the oxygen electrode; open-circuit potentials; oxygen adsorbed species and anodic films on platinum and other noble metals (electrochemical studies, in situ optical studies, in situ surface conductivity measurements; ex situ characterizations); the anodic oxygen evolution reaction (kinetics and mechanisms of the oxygen evolution reaction on metal and oxide electrodes); and cathodic reactions of oxygen (the general scheme of parallel and series reactions of oxygen and hydrogen peroxide; the kinetics of molecular oxygen reduction on different metallic electrodes; oxygen reduction on nonmetallic materials). Concludes that despite the large research effort and extensive literature on the O_2 electrode reactions, the mechanisms remain mostly a matter of speculation and the relationship of the electrocatalytic activity to surface electronic properties and morphology uncertain.

In 60 years of the Institute for Research, Production and Application of Radioisotopes 1919-1979.

The department of dosimetry of the Institute is involved in the absolute measurement of radionuclide activity. The laboratory equipment is briefly described and the main types of manufactured standards are listed. (M.D.).

33829 (INIS-SU—222, pp 65-67) **Kinetics of radioluminescence of beryllium oxide.** Viktorov, L.V.; Gavrilov, K.F.; Giniyatulin, K.N.; Kruzhalov, A.V. (Ural'skij Politekhnicheskij Inst., Sverdlovsk (USSR)). 1982. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780272.

In Physics of radiation damage and radiation material science.

Spectral and kinetic radioluminescent characteristics of Be0 crystals and powders are studied (roentgen or electron irradiation). The influence of high-temperature annealing and dopping with ions of lithium on behaviour of luminescent peaks: 3.9 eV; 4.3 eV and 4.6 eV have been found. Three components with different kinetic parameters are revealed in the 4.6 eV band. Rapid component (70 nc) shows high stable temperature behaviour. It is suggested, that the investigated emission bands are connected with both dopping lithium and beryllium vacancies.

(AN SSSR, Moscow. Inst. Fizicheskoj Khimii). 1982. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780272.

In Physics of radiation damage and radiation material science.

The EPR and IR-spectroscopy methods have been used for a study of the influence of admixed hydroxyl groups on the radiation (γ-radiation) stability of monocrystals and polycrystals of magnesium and calcium oxides. It was shown that in monocrystals of high content of OH^- ions the radiation induced proton diffusion processes occur. In polycrystals a system of admixed hydroxyl groups is necessary for emerging of the Vsub(OH)-centers, but contribute to the tunnel transfer of Fsub(s)sup(+)-centers.

33831 (INIS-SU—222, pp 56-57) **Radiation-chemical conversion of radiolysis products under high-temperature irradiation in alkali-halide crystals.** Shvarts, K.K.; Ehkmanis, Yu.A.; Rabsha, S.Ya. (AN Latvijskoj SSR, Riga. Inst. Fiziki). 1982. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780272.

In Physics of radiation damage and radiation material science.

The high-temperature (400-1000 K) radiolysis processes under electron (3.5 MeV) irradiatior (10^2-5.10^4 Mrad) has been analysed. Complicated temperature dependence of this process was shown which has been conditioned by coagulation and destruction of electron products of radiolysis and by their stabilization with oxygen from surrounding atmosphere.

33832 **(KFK—3639) Investigation of the radiolytic TBP degradation under Purex process conditions.** Becker, R.; Stieglitz, L.; Bautz, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Dec 1983. 57p. (In German). (PWA—66/83). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84751437.

We tried to choose experimental conditions similar to these of the process. In the absence of uranium the rate of the HDBP-formation increased slightly with the acid concentration. After the addition of uranium (Csub(org.)approx.=35 g/l) this dependence disappeared. Irradiations which were carried out under gas atmospheres (N_2, O_2, N_2O) showed only in the presence of N_2O a significantly diminished HDBP formation. For the TBP degradation in aqueous solutions (3 M HNO_3) we found an exponential decrease of the TBP concentration with an increasing radiation dose. The formation rates of H_2MBP and H_3PO_4 were 0,99 mg/Wh (org.) and 0,59 mg/Wh (aq.) for H_2MBP and 4,88 gm/Wh for phosphoric acid. They were considerably lower than those of the HDBP formation. The "G-values" of the safety relevant H_2, CH_4, C_2H_6, C_3H_8 and C_4H_{10} which are produced by the radiolytic solvent degradation too were determined. The G-value found for the hydrogen formation was 0,75, the corresponding values for the gaseous hydrocarbons lied between 2×10^{-2} and 2×10^{-3}. The chemical nature of the complex forming radiolysis products, which accumulate in recycled solvents was elucidated. Long chain acid organophosphates could be identified as the compounds that we looked for. Besides that polycarbonyl compounds could exist in low concentrations too. For the degradation of the alkane diluent the simple semi-quantitative analytical methods were developed in order to gain informations about the concentrations of the interesting compound classes. After a suitable sample pretreatment long chain acid organophosphates, carboxylic acids and diketones in the enol form are determined by the measurement of the electrolytic conductivity. The pulse polarographic investigation of irradiated solvent samples allows the estimation of the concentration of nitroalkanes and alkylnitrates.

33833 **(FRNC-TH—1586) Study of hyperfine interactions in neptunium chalcogenides: NpS_3, $NpSe_3$, Np_2Se_5, Np_3S_5 and Np_3Se_5 by neptunium 237 Moessbauer resonance.** Thevenin, T. (Paris-11 Univ., 91 - Orsay (France)). Apr 1982. 78p. (In French). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751551.

In this work are studied magnetic properties and hyperfine interactions of neptunium sulfides and selenides. The variation of magnetic susceptibility with temperature and Moessbauer resonance of Np237 are measured. Np_2Se_5 is evidenced for the first time and monocrystals of NpS_3 are prepared. Thermal variations of magnetic susceptibility and Moessbauer resonance show a magnetic order at low temperature in NpS_3 (45 K), $NpSe_3$ (55 K), Np_2Se_5 (15 K), Np_3S_5 (13-17 K) and Np_3Se_5 (26 K). Charge of neptunium is given by isomer shifts of Moessbauer resonance spectra, in NpS_3, $NpSe_3$ and Np_2Se_5 neptunium is tetravalent, in Np_3S_5 and Np_3Se_5 charges III and IV are found in the ratio 2/1. Isomer shifts show also the influence of anion electroaffinity and coordinence on the electronic density of neptunium ions.

The Institute's department of analytical chemistry is responsible for the analysis of organic compounds and radiopharmaceuticals, the emission spectrographic analysis of materials, the analysis of inactive mixtures formed by radiation chemical synthesis, and for radiometric analysis methods. A method was developed of analysis of ^{14}C- and ^{3}H-labelled compounds. Many special instruments used for the said tasks have been designed at the Institute. (M.D.).

33843 (INIS-mf—8927, pp 37-45) **Labelled organic compounds.** Kolina, I.; Filip, I. 1981. (In Russian). NTIS (US Sales Only), PC A05/MF A01. Order Number TI84780240.

In 60 years of the Institute for Research, Production and Application of Radioisotopes 1919-1979.

The results are described obtained in research and production of labelled organic compounds. The programme is mainly oriented to the preparation of nucleic acids, proteins and saccharides labelled with ^{3}H and ^{14}C. Some labelling methods and compounds prepared are briefly characterized. (M.D.).

33844 **Educational laboratory experiments on chemistry in a nuclear engineering school.** Akatsu, E. (Japan Atomic Energy Research Institute Radioisotope and Nuclear Engineering School Tokai-mura, Ibaraki-ken 319-11). *Nuclear Technology;* **59**: No. 3, 532-539(Dec 1982).

An educational laboratory experiment on radiochemistry was investigated by students in the general course of the Nuclear Engineering School of Japan Atomic Energy Research Institute. Most of them are not chemical engineers, but electrical and mechanical engineers. Therefore, the educational experiment was designed for them by introducing a "word experiment" in the initial stage and by reducing the chemical procedure as far as possible. It began with calculations on a simple solvent extraction process-the "word experiment"–followed by the chemical separation of ^{144}Pr from ^{144}Ce with tri-n-butyl phosphate in a nitric acid system and then measurement of the radioactive decay and growth of the separated ^{144}Pr and ^{144}Ce, respectively. The chemical procedure was explained by the phenomenon but not by the mechanism of chelation. Most students thought the experiment was an exercise in solvent extraction or radiochemical separation rather than a radioactive equilibrium experiment. However, a pure chemist considered it as a sort of physical experiment, where the chemical procedure was used only for preparation of measuring samples. Another experiment, where ^{137}Cs was measured after isolation with ammonium phosphomolybdate, was also investigated. The experiment eliminated the need for students who were not chemists to know how to use radioactive tracers. These students appreciated the realization that they could understand the radioactivity in the environmental samples in a chemical frame of reference even though they were not chemists.

33845 **(LBL—17220) Conditional velocity statistics in premixed CH_4-air and C_2H_4-air turbulent flames.** Cheng, R.K.; Talbot, L.; Robben, F. (Lawrence Berkeley Lab., CA (USA)). Jan 1984. Contract AC03-76SF00098. 26p. (CONF-840801—14). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012257.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

Portions are illegible in microfiche products.

Conditioned fluctuation intensities and Reynolds stress have been determined separately for the reactants and for the products in two methane-air and two ethylene-air v-shaped premixed turbulent flames. The conditioned quantities are deduced from velocity data obtained by a two-color LDA system using a conditional analysis method based on the presence of a thin flame sheet dividing the two regions. Within the turbulent flame brush, the conditioned turbulent kinetic energy in the reactants remains at the free stream level. The conditioned turbulent kinetic energy in the products, k/sub p/, are higher than in the reactants indicating flame-generated turbulence. Also, k/sub p/ increases with distance from the flame stabilizer, x. Nevertheless, the two conditioned Reynolds stresses are comparable. The unconditioned turbulent kinetic energy and Reynolds stress also increase with x. This increase is proportional to the increase in the difference between the conditioned mean velocities ΔU. The magnitude of ΔU suggests significant stream tube divergence. The results also show qualitative agreement with the model developed by Bray et al. which relates the difference in the conditioned fluctuation intensities to ΔU.

33846 **(LBL—17222) Molecular beam mass spectrometer sampling of flash ignited combustion.** Lucas, D.; Peterson, R.; Brown, N.J.; Oppenheim, A.K. (Lawrence Berkeley Lab., CA (USA)). Jan 1984. Contract AC03-76SF00098. 28p. (CONF-840801—7). NTIS, PC A03/MF A01; GPO Dep. Order Number DE84006771.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

Mass signals from a transient combustion event have been measured using a molecular beam mass spectrometer with a time

resolution of approximately 100 microseconds. The signals are normalized to signals of inert components to compensate for changes in beam intensity caused by rapidly changing source conditions. Pressure traces recorded simultaneously were used to correlate mass signals to significantly reduce variations in time dependent signals caused by experimental fluctuations. Temperature measurements of the sampled gas using a time-of-flight analysis show that there are no significant perturbations caused by cell walls or the sampling orifice. The measured temperature profile is used to predict the extent of beam overrun present during various phases of the combustion event, which is necessary to determine the validity of the recorded data. Mass signals from reactants and stable products in the flash ignited combustion of methane/oxygen/nitrogen dioxide/argon mixtures are presented and discussed, and provide insight regarding the mechanism of this complex system.

33847 **(PB—84-181965) Elementary processes in the catalytic combustion of methane (mechanism, intermediates and controlling reactions). Annual report Oct 82-Sep 83.** Wise, H. (SRI International, Menlo Park, CA (USA)). Dec 1983. 42p. NTIS, PC A03/MF A01.

See also PB83-194944.

The surface reactions involved in the catalytic oxidation of methane have been investigated using single crystal metal surfaces and supported metal crystallites. Transient techniques have been used to explore the role of reaction intermediates. The decomposition of methanol and formaldehyde has been studied to identify possible surface species involved in methane oxidation.

33848 **(SAND—84-8640) Two-dimensional measurements of the [OH] in a constant volume combustion chamber.** Cattolica, R.J.; Vosen, S.R. (Sandia National Labs., Livermore, CA (USA)). Apr 1984. Contract AC04-76DR00789. 23p. (CONF-840801—11). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84011405.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The planar distribution of the OH concentration in a methane-air flame in a constant volume combustion chamber has been measured with two-dimensional laser-induced fluorescence. A Nd:YAG-pumped pulsed dye laser with frequency doubling was used to form a sheet of laser light which excited the OH $A^2\Sigma$ ($v' = 1$) - X^2 Pi ($v'' = 0$) transition. The resulting fluorescence from the OH molecule in a propagating flame was observed with a low-light-level vidicon camera. A map of the OH concentration in the combustion chamber was obtained over a field of view covering 45 mm x 60 mm with a spatial resolution of 0.6 mm x 0.6 mm. For a single 5 ns laser pulse, the fluorescence signal-to-noise ratio (S/N) is 10 at the maximum OH concentration of 2.4×10^{16} cm^{-3}. The measured OH number density profile agrees with the prediction of a laminar flame model to within the experimental accuracy.

33849 **(UCRL—90251) Comprehensive chemical kinetic reaction mechanism for the oxidation of n-butane.** Pitz, W.J.; Westbrook, C.K.; Proscia, W.M.; Dryer, F.L. (Lawrence Livermore National Lab., CA (USA); Princeton Univ., NJ (USA)). 16 Jan 1984. Contract W-7405-ENG-48. 24p. (CONF-840801—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84005739.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

A detailed chemical kinetic reaction mechanism is developed for the intermediate and high temperature oxidation of n-butane. The mechanism, consisting of 238 elementary reactions among 47 chemical species, is validated by comparison between computed and experimental results from shock tubes, turbulent flow reactor, and premixed laminar flames. The model accurately reproduces n-butane combustion kinetics for wide ranges of pressure, temperature, and fuel-air equivalence ratio. In spite of the large number of species and reactions, it is found that computed results are most sensitive to reactions involving the H_2-O_2-CO submechanism, in agreement with other modeling studies of hydrocarbon oxidation.

Mechanical interaction studies and signal processing for surface roughness parameters are reported. Rig modifications that have been implemented are reviewed along with the status of load fluctuation improvement efforts. The status of initial traction/film thickness tests which were conducted with both ball and roller test elements is reviewed. An expository paper comparing models for the contact of rough surfaces is included.

33851 **(INIS-BR—115) Stress analysis for shells with double curvature by finite element method.** Mueller, A. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Engenharia Mecanica). Aug 1981. 125p. (In Portuguese). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84780352.

A simple triangular finite element for plates and shells, is presented. Since the rotation fields are assumed independent of the displacement fields, simple shape functions of second and third degree were used. An implicit penalty method allows one to solve thin shell problems since the Kirchoff-Love hypothesis are automatically satisfied. (Author).

33852 **(NUREG/CR—3686-Vol.4) WIPS: computer code for whip and impact analysis of piping systems. Part D. Verification manual.** Powell, G.H.; Hu, F.C. (California Univ., Berkeley (USA)). Jun 1983. Contract W-7405-ENG-48. 260p. (UCRL—15597-Vol.4). NTIS, PC A12/MF A01; 1 - GPO; GPO Dep. Order Number DE84007403.

Portions are illegible in microfiche products.

This report presents details of a number of examples which have been chosen to verify the WIPS code. The examples have been selected to verify most (but not all) features of WIPS. For each example the following information is provided: (1) A description of the example. (2) Complete WIPSLOG file listings, detailing the steps followed in setting up the example. These listings will enable a user to reproduce each example. (3) DATA file listings. (4) Results, including comparisons with previously reported experiments and/or analyses if available. The conclusions which can be reached from the verification study are as follows. (1) WIPS is an effective tool for the analysis of restrained pipes. Nevertheless, it is recommended that additional verification examples be analyzed before WIPS is used for production analysis. (2) WIPS is an effective tool for the analysis of unrestrained pipes (with large displacements) up to impact with adjacent objects. Again, however, it is recommended that additional verification examples be analyzed before WIPS is used for production analysis. (3) WIPS appears to work well for analyses which make use of the impact analysis option but has not been tested thoroughly. These analyses are extremely complex and very expensive computationally. Considerable additional verification is recommended before production analyses are attempted.

33854 **(SAND—83-1889) Combined experimental/analytical modeling using component mode synthesis.** Martinez, D.R.; Carne, T.G.; Gregory, D.L.; Miller, A.K. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1984. Contract AC04-76DP00789. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013147.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This study evaluates the accuracy of computed modal frequencies and mode shapes obtained from a combined experimental/analytical model for a simple beam structure. The structure was divided into two subsystems and one subsystem was tested to obtain its free-free modes. Using a Component Mode Synthesis (CMS) technique, the experimental modal data base for one subsystem was directly coupled with a finite element model of the other subsystem to create an experimental/analytical model of the total structure. Both the translational and rotational elements of the residual flexibilities and mode shapes at the interface of the experimental subsystem were measured and used in the coupling. The modal frequencies and mode shapes obtained for the combined experimental/analytical model are compared to those for a reference finite element model of the entire structure. The sensitivity of the CMS model predictions to errors in the modal parameters and residual flexibilities, which are required to define a subsystem, is also examined.

33855 **(UCRL—90094) Modelling the hydrofracture process as a coupled double free boundary problem.** Stout, R.B. (Lawrence Livermore National Lab., CA (USA)). 6 Mar 1984. Contract W-7405-ENG-48. 6p. (CONF-840833—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84008324.

From 5. American Society of Civil Engineers/Engineering Mechanics specialty conference; Laramie, WY, USA (1 Aug 1984).

The analysis of a propagating hydrofracture involves determining the position-time history of two free boundaries. One free boundary is the crack-tip position of the fracture and the other is for the wetted front position of fluid flowing in the fracture. A formulation of this double free boundary problem is described in terms of a rate variational principle.

Portions are illegible in microfiche products.

The space-technological investigations presented here aim at increasing the reliability of He II cooling systems for space applications as well as a compilation of data necessary for their optimization. He II cooling systems with operating temperatures T<=2 K and different, partly constant and partly varying cooling capacities are required for infrared astronomy as well as for other scientific investigations in space. Among the not yet fully solved problems of He II handling at zero g the separation of gas and liquid phase during the continuous evaporation of the coolant ranks first. An Active Phase Separator developed for this purpose, a system with an annular flow gap of variable length allowing variation of the cooling capacity over a wide range, has been tested on zero-g flights with KC 135, a special plane, under variation of the acceleration between 2 g and 0 g. The experimental system developed for these flight experiments with its components, which partly had to be specially developed, is described. The results of the flight experiments are presented by means of typical data and are discussed with regard to future development of the cooling systems as well as with regard to the operational demonstration of an APS in zero-g environment as required for its application in GIRL. Theoretical investigations have been made on the Choking effect which appears in case of narrow long flow gaps and which must be understood in order to ensure safe operation of He II cooling systems.

33858 **(CONF-830491—3) Optimum control of electric motor drives for industrial robots.** Guez, A.; Roberts, M. (Florida Univ., Gainesville (USA)). 1983. Contract AC05-79ER10013. 8p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012878.

From PCI/MOTORCON 83 conference; Orlando, FL, USA (19 Apr 1983).

The industrial robot employs many actuators (electric motor drives) to perform a variety of tasks. Multilink manipulator arms, metal contouring machines, remote control tanks, and solar panels for satellites are just a few examples of applications for multiactuator systems. The first major problem is in the coupled, nonlinear structure of the interacting actuators. The second major problem is to find the optimum trajectories of motion. Determining the optimum control input for each drive is a difficult problem to solve. Due to the complex set of equations which govern the system, a great deal of simplification is necessary if a real-time computer is to be used to optimally control the motor drives. This paper describes a method for optimizing the performance (in this case, to minimize time of control) of these motorized actuators by automatically generating the input voltage signals.

33859 (DOE/ER—0113/3, pp 30-39) **Effects of low-temperature fusion neutron irradiation on critical properties of a monofilament niobium-tin superconductor.** Guinan, M.W.; Van Konynenburg, R.A.; Mitchell, J.B. (Lawrence Livermore National Lab., CA). May 1984. NTIS, PC A04/MF A01. Order Number TI84011825. Contract W-7405-ENG-48.

In Sixth annual progress report on special purpose materials for magnetically confined fusion reactors.

The objective of this work was to irradiate a Nb_3Sn superconductor with 14.8 MeV neutrons at 4 K and measure critical current in transverse fields of up to 12 T, irradiating up to a fluence sufficient to decrease the critical current to below its initial value. Critical temperatures were also to be measured. The samples were to be kept near 4 K between the irradiation and the measurement of critical properties. This work is directed toward establishing an engineering design fluence limit for Nb_3Sn when used in fusion reactor superconducting magnets.

33860 **(ECN—83-203) Assembly and test of the SULTAN facility.** Franken, W.M.P. (Stichting Energieonderzoek Centrum Nederland, Petten). Dec 1983. 51p. ECN, P.O. Box 1, 1755 ZG Petten, Netherlands. Order Number TI84750916.

The development of high current, high field superconducting cables, applicable in large magnets for future fusion devices, is an important item in the European Fusion Technology Programme. In 1979 three European laboratories, SIN (Switzerland), ENEA (Italy) and ECN, started a collaboration in this field with the main objective to construct and to operate the large test facility

SULTAN (SUpra Leiter TestANlage). This facility will provide the necessary equipment for testing short samples of prototype conductors in a high bias field at various cooling modes and operation conditions. The SULTAN facility will be constructed in two phases. The first phase involved the construction of superconducting background coils for 8 Tesla field in a one meter cold bore and all indispensable equipment on cryogenics, power supplies and data acquisition for magnet operation and conductor testing. In the second phase the coil system will be upgraded to 12 Tesla in a 0.6 m bore by A-15 insert coils. The fabrication of the various components for the first construction phase has been finished early 1983. The facility was then assembled at SIN in Villigen, Switzerland and put into operation successfully. The operation experience is summarized for the first cooldown and energization with special attention to the 8 Tesla insert coil, that was delivered by ECN as their contribution to the SULTAN collaboration.

33861 **(GA-A—17545) Improved method for the prediction of centrifugal compressor rotational-tone noise.** Adams, R.G.; Vickers, B.H. (GA Technologies, Inc., San Diego, CA (USA)). Apr 1984. Contract AT03-84SF11963. 9p. (CONF-840804—22). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013345.

From Intersociety energy conversion engineering conference; San Francisco, CA, USA (19 Aug 1984).

Portions are illegible in microfiche products.

This paper presents a method of calculating the sound power produced by the action of the impeller vanes from the design parameters of the compressor and the calculated flow loss coefficients. This method develops relationships between the non-dimensional wake width, ratio between the jet and wake velocities and the impeller loss coefficient. Fourier analysis of the resulting square wave gives an expression for the fluctuating pressure force at the impeller exit surface. This is then applied to the acoustic dipole source term derived in an earlier paper to calculate the sound power produced by the rotating impeller.

33862 **(INIS-mf—8395) Description of the transport/storage container TN 1300.** Anspach, W. (Transnuklear G.m.b.H., Hanau (Germany, F.R.)). Oct 1980. 10p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84780254.

TN 8015 A.

The container TN 1300 developed by Transnuklear GmbH at Hanau served for dry transport and for storage of irradiated fuel assemblies from light water reactors of the type 1300 MWe. The container belongs to the packing category of the type B(U) and to the nuclear safety class II. (orig./RW).

33863 (INIS-SU—219, pp 152-158) **Cool-down of circulation-type superconducting magnetic systems.** Gorbachev, S.P.; Krikunov, A.A.; Ladokhin, S.D. (Nauchno-Proizvodstvennoe Ob"edinenie Kriogennogo Mashinostroeniya, Balashikha (USSR)). 1982. (In Russian). NTIS (US Sales Only), PC A14/MF A01. Order Number TI84780219. (CONF-8206209—Vol.2).

From EPRI symposium on the state of the art of power plant feed pumps; Cherry Hill, NJ, USA (2 Jun 1982).

Cool-down of two channels of superconducting systems with cryoagent once-through flow is considered analytically. Heat exchange between channels through "heat bridges" (electric insulation spacers, etc) in case of stepwise changes of the inlet gas temperature is considered. The model proposed and analytical dependences obtained can be used for calculating the cool-down time for superconducting magnetic systems. Determining the cool-down time is shown to be feasible for complex multichannel objects with different boundary conditions by reducing the object to one channel in a definite thermal resistance range.

33864 **(K/CSD/TM—52) Ekman boundary conditions for numerical models of centrifuge flows.** Park, J.E.; Drake, J.B. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). Apr 1984. Contract AC05-84OR21400. 30p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013576.

The boundary layers which form on the ends of a gas centrifuge have received a great deal of analytical attention from individuals concerned with predicting flows within gas centrifuges. Three basic approaches have been taken in estimating the heat transfer and drag at the solid gas interfaces at the ends of a centrifuge. First, the details of the flow may be estimated numerically using finite difference techniques and a very fine grid in the vicinity of the ends. The approach yields an enormous amount of detail. The cost in computer time and memory charges is very great and the extensive detail is difficult to utilize effectively. Second, the boundary layers may simply be ignored. With this approach, the size of the finite difference mesh is controlled by other considerations, allowing economically attractive simulation of centrifuge flows for many situations. Mathematically, the boundary conditions in the second option are simply zero shears rather than specified velocities, zero heat fluxes rather than specified temperatures. However, complete neglect of boundary layer influence at the ends is disquieting from a physical viewpoint. The third effort has been to model the boundary layers analytically and couple those models to solutions for the interior flow. In this chapter, previous efforts to model the boundary layers are reviewed.

33865 **(N—8418575) Modeling of transient heat pipe operation.** Colwell, G.T.; Hartley, J.G. (Georgia Inst. of Tech., Atlanta (USA)). Feb 1983. 11p. (NASA-CR—173305). NTIS, PC A02/MF A01.

The major goal of this project is to develop mathematical models of heat pipes which can be used to predict transient behavior under normal and adverse conditions. The models and solution techniques are to be formulated so that they can be incorporated into existing NASA structural design codes. The major parameters of interest are heat flux distribution, temperature distribution, working fluid pressure distribution, fluid and containment thermal and mechanical properties and geometry. Normal transient operation is taken to be operating conditions where the capillary structure remains fully wetted. Adverse transient operation occurs when drying, re-wetting, choking, non-continuum flow, thawing, freezing, etc., occur in the internal heat pipe working fluid.

33866 **(SAND—84-0485C) Effect of thermal aging on the output of a pyrotechnic actuator.** Rogers, J.W. Jr.; Erickson, K.L.; Bickes, R.W. Jr. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC02-76CH00016. 13p. (CONF-840867—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012903.

From 9. international protechnics seminar; Colorado Springs, CO, USA (6 Aug 1984).

A thermal aging program with a shock-initiated through-bulkhead actuator (TBA) indicates an enhancement of energy output with age and storage temperature. The TBA and output experiments are described and a possible mechanism that accounts for this phenomenon is presented.

33867 **(SAND—84-0972) Optical fiber termination and splicing techniques.** George, M.; Miller, M.M. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1984. Contract AC04-76DP00789. 31p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013919.

This report details various techniques that have been developed during the course of optical fiber experimentation and installations. During the development phases, attempts have been made to devise the quickest and least tedious methods in each area of optical fiber work. These procedures include the termination and splicing of various cable types. Also included are appendices containing information on tools, connectors, jumpers, and splicing equipment.

33868 **(SAND—84-1297C) Failure prediction of notched pressure vessels using the CTOD approach.** Wellman, G.W.; Rolfe, S.T.; Dodds, R.H. (Sandia National Labs., Albuquerque, NM (USA); Kansas Univ., Lawrence (USA). Dept. of Civil Engineering). 1984. Contract AC04-76DP00789. 11p. (CONF-840647—18). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013057.

From ASME pressure vessel and piping conference; San Antonio, TX, USA (17 Jun 1984).

Portions are illegible in microfiche products.

Currently accepted analysis procedures to determine failure pressures of notched vessels are limited to the types of behavior defined by Linear Elastic Fracture mechanics (LEFM) or by various

types of limit load calculations. LEFM is restricted to very brittle material behavior (linear elastic plane-strain behavior, K/sub Ic/, as defined by ASTM E-399). Limit load calculations generally are restricted to upper shelf, flow stress dependent material behavior. There is a wide range of material behavior between these two types of analysis where Elastic-Plastic Fracture Mechanics (E-PFM) analysis should be used. This paper discusses the application of the Crack Tip Opening Displacement (CTOD) elastic-plastic fracture parameter to predict burst pressures. A series of burst tests performed on notched pressure vessels was analyzed. The tested vessels exhibited behavior ranging from very brittle to entirely ductile. The current British Welding Institute (Burdekin-Dawes design curve) approach as well as the finite element method was used to obtain the analytical burst pressures for each vessel. Nonlinear finite element computations were performed on both 2-D and 3-D models of the notched vessels. Predictions of burst pressure obtained using the British Welding Institute design approach (which is to insure fail-safe behavior and thus has a built in factor of safety) and the finite analysis element method are compared with the actual experimental burst pressures. Burst pressures computed using nonlinear finite element analyses agree to within seven percent of experimental burst pressures in each case. The predicted burst pressures based on finite element computations are significantly more accurate than those predicted using the current British Welding Institute approach.

33869 **(UCRL—90475) Design of a high-performance slide and drive system for a small precision machining research lathe.** Donaldson, R.R.; Maddux, A.S. (Lawrence Livermore National Lab., CA (USA)). Mar 1984. Contract W-7405-ENG-48. 21p. (CONF-840850—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84011059.

From CIRP assembly; Madison, WI, USA (20 Aug 1984).

The development of high-accuracy machine tools, principally through interest in diamond turning, plus the availability of new cutting tool materials, offers the possibility of improving workpiece accuracy for a much larger variety of materials than that addressed by diamond tools. This paper describes the design and measured performance of a slideway and servo-drive system for a small lathe intended as a tool for research on the above subject, with emphasis on the servo-control design. The slide system provides high accuracy and stiffness over a travel of 100 mm, utilizing oil hydrostatic bearings and a capstan roller drive with integral dc motor and tachometer.

33870 **Quench back in thin superconducting solenoid magnets.** Green, M.A. (Lawrence Berkeley Lab., CA (USA)). *Cryogenics;* **24**: No. 1, 3-10(Jan 1984).

The paper develops the theory for thermal quench back in thin solenoid magnets and compares the theory with measurements made in two one-meter diameter superconducting solenoid magnets.

33871 **Free electron laser for a mildly relativistic electron beam.** Uhm, H.S. (Naval Surface Weapons Center Silver Spring, Maryland 20910). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3121-3123(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

One of the most basic instabilities which characterize a relativistic electron beam propagating through a helical wiggler (or undulator) magnetic field is the free electron laser instability. This instability has been extensively investigated in recent years with particular emphasis on applications involving high power microwave radiation. Previous theoretical studies of this instability have tended to result in the conclusion that high energy beams with a relativistic factor much greater than 1 are required to generate high frequency microwave radiation. Beams with this high a relativistic factor have proven to be highly unsuited, however, to compact and practical microwave tubes. To this end, for a relativistic electron beam propagating through a dielectric loaded waveguide, this paper presents a method for the bandwidth and frequency enhancement of the free electron laser instability which makes use of a mild (less than 1.5) relativistic factor. It demonstrates that the instability bandwidth and frequency can be greatly enhanced for specified values of the beam energy and wiggler wavelength if the dielectric constant and the thickness of the dielectric material are appropriately selected. The paper also presents a new scheme for a broad bandwidth microwave amplifier.

33872 **Compulsator, a high power compensated pulsed alternator.** Weldon, W.F.; Bird, W.L.; Driga, M.D.; Rylander, H.G.; Tolk, K.M.; Woodson, H.H. (Center for Electromechanics, Univ. of Texas at Austin, Austin, TX 78712). pp 925-938 of Energy storage, compression, and switching. Vol. 2. Nardi, V.; Bostick, W.H.; Sahlin, H. New York, NY; Plenum Publishing Corp. (1983). (CONF-751247—). Contract W-7405-ENG-48.

From Colloquium on thermal insulators at high temperature; Paris, France (3 Dec 1975).

This chapter describes a pulsed power supply utilizing inertial energy storage as a possible replacement for large capacitor banks. The compulsator overcomes many of the limitations of the pulsed homopolar generators previously developed by the Center for Electromechanics and elsewhere in that it offers high voltage (10's of kV) and consequently higher pulse rise times, is self commutating, and offers the possibility of generating repetitive pulses. The compulsator converts rotational inertial energy directly into electrical energy utilizing the principles of both magnetic induction and flux compression. The theory of operation, a prototype compulsator design, and advanced compulsator designs are discussed.

33873 **(AD-A—137317/4) New high power coherent radiation sources. Memorandum report.** Sprangle, P.; Coffey, T. (Naval Research Lab., Washington, DC (USA)). 9 Jan 1984. 48p. (NRL-MR—5224). NTIS, PC A03/MF A01.

In recent years, there has been considerable renewed interest in the development of novel devices for the production of high power coherent electromagnetic radiation. This interest has been motivated largely by the realization that, with existing technology, certain processes utilizing relativistic electron beams can produce coherent electromagnetic radiation at power levels far in excess of those achieved by conventional electron devices. This paper will review the current status of this rapidly developing field, with emphasis on two generic devices. The major thrust in the recent development of electron beam driven radiation sources has been directed towards achieving shorter wavelengths, greater power and higher efficiencies. Shortly after the development of such successful sources as the magnetron, kylstron and various traveling wave devices, it became clear that, in their original form, they were limited in their ability to produce high levels of radiation efficiently at short wavelengths. To circumvent the inherent limitations of these conventional coherent radiation sources, many new concepts and mechanisms, as well as variations on conventional concepts, were proposed. This paper is concerned primarily with two devices which are, relatively speaking, newcomers to the list of coherent classical radiation sources. They are the free electron laser and the cyclotron resonance maser (CRM); one well known type of CRM is the gyrotron.

33874 **(INIS-BR—107, pp 41-42) Grazing-incidence dye laser with an intra-cavity.** Lisboa, J.A.; Teixeira, S.R.; Cunha, S.L.S.; Francke, R.E. (Rio Grande do Sul Univ., Porto Alegre (Brazil). Inst. de Fisica); Grieneisen, H.-P. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Laboratorio de Estudos Avancados). 1983. NTIS (US Sales Only), PC A10/MF A01. Order Number DE84780267.

In Progress Report 1981-1982 - Instituto de Fisica - Universidade Federal do Rio Grande do Sul.

In Progress Report 1981-1982 - Instituto de Fisica - Universidade Federal do Rio Grande do Sul.

33876 **(K/ET—235) Discharge pumped rare gas halide laser materials and gas clean-up studies.** Akerman, M.A.; Tennant, R.A. (Oak Ridge Gaseous Diffusion Plant, TN (USA); Los Alamos Scientific Lab., NM (USA)). Sep 1979. Contract AC05-84OT21400. 19p. (CONF-7909277—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012756.

From Excimer laser meeting; Charleston, SC, USA (11 Sep 1979).

Rare Gas Halide (RGH) laser systems were subjected to corrosion tests with F_2. The resultant impurties (HF, CO_2, COF_2, SO_2F_2, SiF_4, C_2F_6, CF_4, and C/sub x/H/sub x/) decreased laser operation and energy output to varying degrees, up to and including shutdown. Trapping systems were developed to remove the impurities and return the laser to higher operation efficiencies. The most effective systems were LN_2 for ArF lasers and hot calcium operating at 600° to 700°C for KrF and XeCl lasers.

33877 **(N—8418622) Development of X-ray laser media. Measurement of gain and development of cavity resonators for wavelengths near 130 angstroms, Volume 2.** Forsyth, J.M. (Rochester Univ., NY (USA)). Feb 1983. 217p. (AD-A—136306). NTIS, PC A10/MF A01.

The characteristic properties of multilayer reflectors for X-ray and XUV radiation (1A - 600A) permit solutions to Maxwell's equations for a quasi-periodic reflector whose layers may contain arbitrary index gradients. This solution can be formulated as a difference equation that propagates the amplitude reflectance across each layer pair. The difference equation resembles the Airy summation for single layers, but has a simpler Ricatti form. From the difference equation, design criteria can be derived for maximization of multilayer reflectivity. These criteria provide guidance in the selection of appropriate multilayer materials, and are used to derive approximate scaling laws for multilayer reflecting properties. The reflecting properties of X-ray multilayer devices are discussed.

33878 **(PB—84-147230) Argument principle in stability analysis: application to a single-mode laser with optical feedback.** Jaskorzynska, B.; Lenstra, D. (Technische Hogeschool Delft (Netherlands). Afdeling Elektrotechniek). Oct 1983. 26p. NTIS, PC E04/MF E01.

The argument principle is employed to numerically investigate the stability of simple-harmonic solutions to a non-linear ordinary difference-differential equation. This equation is an extension of a similar one used earlier to analyse the properties of the field in a laser with external feedback. The present extension includes multiple reflections in the external system.

33879 **Free electron lasers for laser fusions.** Segall, S. (KMS Fusion, Inc., Ann Arbor, MI 48106). pp 201-218 of Energy storage, compression, and switching. Vol. 2. Nardi, V.; Bostick, W.H.; Sahlin, H. New York, NY; Plenum Publishing Corp. (1983). (CONF-751247—). Contract AC08-78DP40030.

From Colloquium on thermal insulators at high temperature; Paris, France (3 Dec 1975).

This chapter describes a design for a pulsed multipass free electron laser (FEL) employing a recirculating electron beam. The FEL has many potential advantages as a laser fusion driver including tuneability, high repetition rate, and potential high efficiency. An output power of 100 TW can be obtained with an optical system consisting of only 4 amplifiers and 4 mirrors with a peak electron current in the storage ring of 1600 amperes. Laser efficiencies of up to 50% may be possible. Methods are discussed of compensating or correcting for induced electron energy spread, and a technique is explained for reducing peak input power requirements in a reactor-sized system.

4204 Heat Transfer And Fluid Flow

REFER ALSO TO CITATION(S) 33087, 33268, 33345, 33346, 33615, 33857, 33860

33880 **(BNL—34707) Two-fluid instability.** Stewart, H.B. (Brookhaven National Lab., Upton, NY (USA)). 1984. Contract AC02-76CH00016. 8p. (CONF-840816—13). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012899.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

Portions are illegible in microfiche products.

The ability of interpenetrating flow models to represent multidimensional instabilities is probed by numerical experiments with an L-shaped two-fluid jet. Periodic and nonperiodic oscillations of various types are observed, and a partial phase portrait is constructed. The numerical experiments suggest new approaches to verifying transient interpenetrating flow models. 18 references.

33881 **(CONF-831063—14) Effects of system and geometrical parameters on the flow of Class-B solids in overflow standpipes.** Sauer, R.A.; Chan, I.H.; Knowlton, T.M. (Institute of Gas Technology, Chicago, IL (USA)). 1983. Contract AC21-80ET14705. 43p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013948.

From American Institute of Chemical Engineers fall annual meeting; Washington, DC, USA (30 Oct 1983).

This seal-leg study was initiated to provide information on the flow characteristics of Class B solids through standpipes. Experiments were conducted to determine the effects of solids flow rate, particle density, particle size, standpipe diameter, fluidizing-gas velocity, standpipe pressure drop and standpipe exit height on the performance of standpipes operating in the overflow mode. The effects of the amount and location of standpipe aeration and the effect of standpipe angle of inclination were also investigated.

33882 **(CONF-840816—4) Heat transfer with phase change in plate-fin heat exchangers.** Panchal, C.B. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 15p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84006405.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

A theoretical and experimental study was conducted for convective evaporation and condensation in plate-fin compact heat exchangers. The overall performance of a brazed-aluminum heat exchanger in the evaporation mode with ammonia and in the condensation mode with both ammonia and refrigerant R-22 as working fluids. The heat exchanger has straight perforated fins on the working-fluid side and extruded rectangular channels on the single-phase (water) side. The two-phase flow in narrow channels of the heat exchanger is modeled using a triangular relationship between pressure gradient, liquid film flow rate, and film thickness. The overall performance of the heat exchanger is calculated by employing local heat-transfer analysis and integrating mass- and heat-balance equations along the heat-exchanger length. Theoretical predictions are found to agree favorably with experimental results for a prototypical heat exchanger unit.

33883 **(CONF-840816—5) Shellside waterflow pressure drop distribution measurements in an industrial-sized test heat exchanger.** Halle, H.; Chenoweth, J.M.; Wambsganss, M.W. (Argonne National Lab., IL (USA); Heat Transfer Research, Inc., Alhambra, CA (USA)). 1984. Contract W-31-109-ENG-38. 30p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84006412.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

Throughout the life of a heat exchanger, a significant part of the operating cost arises from pumping the heat transfer fluids through and past the tubes. The pumping power requirement is continuous and depends directly upon the magnitude of the pressure losses. Thus, in order to select an optimum heat exchanger design, it is as important to be able to predict pressure drop accurately as it is to predict heat transfer. This paper presents experi-

mental measurements of the shellside pressure drop for 25 different segmentally-baffled bundle configurations in a 0.6-m (24-in.) diameter by 3.7-m (12-ft) long shell with single inlet and outlet nozzles. Both plain and finned tubes, nominally 19-mm (0.75-in.) outside diameter, were arranged on equilateral triangular, square, rotated triangular, and rotated square tubefield layouts with a tube pitch-to-diameter ratio of 1.25. Isothermal water tests for a range of Reynolds numbers from 7000 to 100,000 were run to measure overall as well as incremental pressure drops across sections of the exchanger. The experimental results are given and correlated with a pressure drop versus flowrate relationship. A preliminary method was developed to predict shellside nozzle pressure drop.

33884 **(CONF-841201—10) Experimental study of natural convection melting of ice in salt solutions.** Fang, L.J.; Cheung, F.B.; Linehan, J.H.; Pedersen, D.R. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013455.

From ASME winter annual meeting; New Orleans, LA, USA (9 Dec 1984).

Portions are illegible in microfiche products.

The solid-liquid interface morphology and the micro-physical process near the moving phase boundary during natural convection melting of a horizontal layer of ice by an overlying pool of salt solution were studied experimentally. A cathetometer which amplifies the interface region was used to measure the ice melting rate. Also measured were the temperature transients of the liquid pool. Within the temperature and the density ratio ranges explored, the ice melting rate was found to be very sensitive to the ratio of pool-to-ice melt density but independent of pool-to-ice temperature difference. By varying the density ratio, three different flow regimes and morphologies of the solid-liquid interface were observed, with melt streamers emanating from the crests of the wavy interface into the pool in all three cases. The measured wavelengths (spacing) between the streamers for four different pairs of materials were correlated with the density ratio and found to agree favorably with the predictions of Taylor instability theory.

33885 **(CTOM—46983) Study of air-water two-phase flow using the neutron attenuation technique.** Younis, M.H. (McMaster Univ., Hamilton, Ontario (Canada)). Oct 1979. 402p. Canadian Theses on Microfiche Service, National Library of Canada, Ottawa K1A 0N4.

Void behaviour in a vertical conduit containing a flowing mixture of air was studied using a neutron attenuation technique. A neutron beam extracted from McMaster's Swimming Pool Reactor was conditioned to provide a collimated beam of thermal neutrons with low gamma and fast neutron background. A series of experiments was performed to obtain information on the steady-state radial void profile in the bubble and annular flow regimes for a 3/4 in. I.D. test section with gas and liquid fluxes up to about 32 m/sec and 80 cm/sec respectively. The dynamic behaviour of the system to a perturbation in gas flowrate was measured and compared to that predicted by the void propagation equation.

33886 **(INIS-BR—116) Numerical calculation of the main variables of the laminar flow around a circumferential square obstacle at the wall of a circular pipe.** Nogueira, A.C.R. (Santa Catarina Univ., Florianopolis (Brazil). Programa de Pos-graduacao em Engenharia Mecanica). Oct 1981. 128p. (In Portuguese). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84780350.

The numerical calculation of the main variables of the laminar, incompressible, axissymmetric, steady flow around a circumferential square obstacle placed at the wall of a circular pipe, is done. The velocity profiles, the separating length and the shape of the separating streamline are compared with experimental available data and a good agreement is achieved. (E.G.).

33904 **(KFK—3641) Pattern selection in single-component systems coupling Benard convection and solidification.** Davis, S.H.; Mueller, U.; Dietsche, C. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente). Dec 1983. 42p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751442.

A horizontal layer is heated from below and cooled from above so that the enclosed single-component liquid is frozen in the upper part of the layer. When the imposed temperature difference is such that the Rayleigh number across the liquid is supercritical, there is Benard convection coupled with the dynamics of the solidification interface. An experiment is presented which shows that the interfacial corrugations that result are two-dimensional when this "ice" is thin but hexagonal when the "ice" is thick. A weakly-nonlinear convective instability theory is presented which explains this behavior, and isolates the mechanism of the pattern selection. Jump behavior is seen in the liquid-layer thickness at the onset of hexagonal convection.

33905 **(LA-UR—84-166) Temperature and heat-flux distributions in a strip-heated composite slab.** Jones, G.F. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 19p. (CONF-840816—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84006016.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

The steady temperature and heat-flux distributions for a composite slab consistig of a strip-heated, large-conductivity fin in intimate contact with a small-conductivity, convectively cooled substrate are obtained. Such a problem has application to the strip heating of process equipment and laboratory experiments where uniform thermal conditions are desired and where the conductivity of the substrate is small. Analytical methods are used to obtain closed-form solutions for the local temperature and heat flux for the full, two-dimensional problem and for the bounding case of no transverse conduction within the substrate. A design procedure to determine the strip-heater spacing necessary for a prescribed maximum variation in heat flux at he convectively cooled surface is presented. An application example is given and the results discussed. Expressions for the steady temperature and heat flux are also obtained for the limiting cases of infinite heat transfer coefficient and zero-thickness substrate.

33906 **(LA-UR—84-1189) Investigation of single-substance horizontal two-phase flow.** Dickinson, D.A.; Maeder, P.F. (Brown Univ., Providence, RI (USA). Div. of Engineering; Los Alamos National Lab., NM (USA)). Mar 1984. Contract AC02-79ET27225. 186p. NTIS, PC A09/MF A01; 1; GPO Dep. Order Number DE84012292.

Portions are illegible in microfiche products; Thesis. Submitted by D.A. Dickinson.

Despite the abundance of work in the field of two-phase flow, it seems as though a consensus has not been reached on some of the fundamental points. Although exceptions exist, adequate physical interpretation of the flow seems to be hindered either by complexity of analysis or, in the opposite extreme, the trend toward limited-range analysis and correlations. The dissertation presents the derivation of basic conservation equations for the phases. The combined equations are used to examine the phenomenon of slip and its practical limitations, the Fanno line for single-substance flow and the effect of slip on choking. Equations for critical mass flux in the presence of slip are derived. The Mach, Reynolds and Froude numbers based on conditions at flashing are introduced as the characteristic parameters, and the importance of compressibility in single-substance two-phase flow is discussed. Experimental measurements of pressure change and void fraction for flow in the highly compressible range ($.5 < Ma < 1$) are presented. The working fluid is Refrigerant R-114, at room temperature, in a test section of diameter 5 cm and length 8 m. The effect of the Froude and Mach numbers is examined. The experimental facility is operated intermittently with running times of approximately two minutes and is instrumented for rapid measurements using a computer data acquisition and control system. A description of the facility and procedure is provided.

33907 **(LA-UR—84-1704) Heat pipe development status.** Merrigan, M.A. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 10p. (CONF-8406131—3). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012580.

From 1. SP-100 program integration meeting; Danvers, MA, USA (13 Jun 1984).

Portions are illegible in microfiche products.

Test heat pipes have been operated in the 1400 K to 1700 K range for periods in excess of 20,000 hours with the objective of understanding and controlling corrosion and failure mechanisms. The results of a post test analysis of one of these heat pipes that was operated for 25,216 hours at 1700 K are reviewed and the implications for heat pipe lifetime discussed. An in-process report of an investigation of transient heat pipe behavior is presented. This investigation is being conducted as a result of restart problems encountered during life test of a 2 m. radiation cooled heat pipe. The results of a series of shut-down tests from power and temperature are given and probable causes of the restart problem discussed.

33908 **(SAND—83-2358C) Least-squares smoothing of direct-exchange areas in zonal analysis.** Larsen, M.E.; Howell, J.R. (Sandia National Labs., Albuquerque, NM (USA); Texas Univ., Austin (USA). Dept. of Mechanical Engineering). 1984. Contract AC04-76DP00789. 17p. (CONF-840816—1). NTIS PC A02/MF A01. Order Number DE84002612.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

The method of Lagrange-multipliers has been used to determine adjustments to be made to a set of direct-exchange areas used in zonal analysis of a radiating enclosure containing a participating medium. The resulting adjusted direct-exchange areas satisfy conservation laws and the condition that an objective function be minimized. The objective function allows weights to be assigned to each adjustment. The solution of a set of linear algebraic equations yields the required adjustments. The method is well-suited for adjusting a set of direct-exchange areas which are assumed to include random inaccuracies. Other adjustment techniques in the literature are discussed and compared, and application of the present method is demonstrated.

33909 **(UCRL—90319) Unsteady heat transfer during laminar flame quenching.** Vosen, S.R.; Greif, R.; Westbrook, C. (Lawrence Berkeley Lab., CA (USA); Lawrence Livermore National Lab., CA (USA)). 23 Jan 1984. Contract W-7405-ENG-48;AC03-76SF00098. 23p. (CONF-840801—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84006301.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

Measurements were made of the unsteady heat transfer to a wall during the quenching of premixed, methane-air flames. One dimensional laminar flames were produced in a constant volume chamber and the heat transfer into the quenching surface was measured by means of a platinum thin film resistance thermometer. The experiments were performed at pressures near atmospheric over a range of equivalence ratios from 0.7 to 1.2. Predictions of the heat transfer were made with two numerical finite difference models, one with detailed kinetics and the other with single step kinetics. The main experimental results are: (1) the data are successfully correlated using the heat release rate of the flame prior to quenching; and (2) the maximum heat flux is related to the quenching distance and thus it may be possible to use measurements of the quenching distance to predict the maximum heat flux. A comparison of the experimental results and the numerical calculations revealed that: (1) a single step reaction model predicts the heat transfer as well as a detailed kinetics model, to within 15% of the experimental results; and (2) thermal diffusion and the chemical reaction rate of combustion are the dominant processes which determine the heat flux during quenching.

33910 **Comments on the formulation of the one-dimensional six-equation two-phase flow model.** Le Cog, G.; Lewi, J.; Raymond, P. (Commissariat a l'Energie Atomique, Centre d'Etudes Nucleaires de Saclay Service d'Etudes de Reacteurs et de Mathematiques Appliquees, Boite Postale No. 2 91190 Gif-sur-Yvette). *Nuclear Science and Engineering;* **81**: No. 1, 1-8(May 1982).

The use of the one-dimensional two-phase flow six-equation model requires knowledge of mass, momentum, and energy transfers between the phases. These transfers can be expressed from the flow parameters and their derivatives. The first part of this paper is devoted to the formulation of the entropy production at the interface as a function of the velocity, Gibbs potential and temperature of each phase. It is assumed that each transfer can be expressed in the form $R = R^* + \delta R$, where R^* is the reversible part and δR the irreversible part of the transfer R. The linear theory of irreversible thermodynamics allows the formulation of δR. The expression of R^* may include differential terms. In the second part of this paper, the authors show how to write interfacial transfer terms to reduce the six-equation model into a lower order model. The last part of this paper presents an original method for computing critical flow, taking into account the flow blockage phenomenon, which is observed when variations of downstream conditions do not produce any significant effect on the upstream flow, even though the fluid velocity is less than the sound velocity.

33911 **A numerical study of weakly compressible rotating flows in a gas centrifuge.** Harada, I. (Energy Research Laboratory, Hitachi, Ltd. 1168 Moriyama-cho, Hitachi, Ibaraki 316). *Nuclear Science and Engineering;* **73**: No. 3, 225-241(Mar 1980).

Numerical investigations have been made on thermally, mechanically, and thermomechanically driven flows of a weakly compressible gas in a gas centrifuge assuming an axisymmetric continuum flow. The finite difference method developed for these computations is based on the Euler/upwind scheme and provides a numerically stable solution. It is found that an almost cylindrical Couette flow is established in an annulus despite the end effects of the plates and that the two mechanically driven circulations interact with the thermally driven circulations.

33912 **(EGG-M—11584) Enhanced fourier algorithms for ultrasonic crack characterization.** Seydel, J.A.; Johnson, J.A. (EG and G Idaho, Inc., Idaho Falls (USA)). 1984. Contract AC07-76ID01570. 6p. (CONF-8404123—5). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012544.

From 2. symposium on energy engineering sciences; Argonne, IL, USA (10 Apr 1984).

This paper describes the detection and processing of information in ultrasonic data that is usually ignored in the imaging process. Experimental evidence shows that such data carries information concerning the target size; simulations and experimental data demonstrate a new data processing method which can substantially increase the sensitivity of ultrasonic image forming systems.

33913 **(EPRI-NP—3347-SR) Nondestructive evaluation program: progress in 1983.** Dau, G.J.; Armor, A.; Kolar, M.J.; Lapides, M.E.; Liu, S.N.; Oldberg, T.; Quinn, J.R.; Scheibel, J.R.; Viswanathan, R. (Electric Power Research Inst., Palo Alto, CA (USA). Systems and Materials Dept.). Mar 1984. 564p. (CONF-8311171—). Electric Power Research Institute, Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI84920314.

From EPRI nondestructive examination information meeting; Palo Alto, CA, USA (10 Nov 1983).

The increasing cost of equipment for generating plants and the potential increase in productivity and safety available for rapidly-developing Nondestructive Evaluation (NDE) technology led EPRI to the initiation of a Nondestructive Evaluation Program in 1974. The major direction to date has been toward light water reactor inspection problems; however, increased application to other systems is now underway. This report presents a comprehensive review of the EPRI effort in this area. Most of the report consists of contractor-supplied progress reports of each current project. An organizational plan of the program is presented in overview. Organization from several viewpoints is presented, e.g., in-service inspection operations, R & D personnel, and utility representatives. The progress reports are arranged into sections titled: general, pipe and nozzle, pressure vessel, steam generator and boiler tube, turbine, and materials properties measurements. Separate abstracts have been prepared for 24 of the progress reports. (DLC)

From ASME pressure vessel and piping conference; San Antonio, TX, USA (17 Jun 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The uses of elastic wave scattering theory in ultrasonic nondestructive evaluation are reviewed. The present understanding of the scattering from stress free, elliptical cracks in unbounded media is first summarized. This is followed by a discussion of additional

problems imposed by the topography of real cracks and part surfaces. Finally, the increasing use of models in engineering applications is illustrated by examples taken from the inspection of nuclear power plant piping and pressure vessel welds and aircraft turbine engine rotor components.

33916 **(DOE/ER/10709—3) Method of vibrational control in the problem of stabilization of chemical reactors. Final report, July 1, 1980-February 29, 1984.** Meerkov, S.M. (Illinois Inst. of Tech., Chicago (USA)). May 1984. Contract AC02-80ER10709. 26p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013451.

The main objective of this research project was to further develop a new control technique, referred to as Vibrational Control, and apply it to stabilization of unstable, but economically efficient, steady states of Chemical Reactors. This objective has been achieved. A method for analysis of dynamic systems with fast parametric oscillations has been developed. Conditions of vibrational stabilizability for a class of nonlinear systems have been derived. The developed formalisms have been applied to the problem of vibrational stabilization of exothermic, catalytic and autocatalytic reactions taking place in Continuous Stirred Tank Reactors. It has been shown that the introduction of vibrational control results in an increase of the reactor yield in the range of 20% to 300%, depending on the reactor conditions and operating point.

33917 **(BMFT-FB-T—84-010) Dyes for displays.** Claussen, U. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Jan 1984. 30p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751278.

The objective of the project was the improvement of contrast and visibility of LCD by two different means: - by development of fluorescent dyes to increase the visibility of fluorescent activated displays (FLAD); - by development of dichroic dyes to increase the contrast of displays. This work has been done in close cooperation with the electronic industry, where the newly synthesized dyes were tested. The targets for the chemical synthesis were selected with the help of computer model calculations. Results: The work on FLAD resulted in a marketable range of dyes. Since the interest of the electronic industries concerning FLAD was low, the investigations were stopped. Dichroic dyes, especially black mixtures with good light fastness, order parameter, and solubility in nematic phases have been developed. The application of these dyes is restricted to in-door use only because of an increase of viscosity below -10°C. Applications on a technical scale, e.g. for the automotive industry, will only the possible if the displays work at temperatures down to -40°C. This problem requires a complex optimization of the dye/nematic phase system.

33918 **(LA—8862-MS-Rev.2) Magnetic switches and circuits. Rev. 2.** Nunnally, W.C. (Los Alamos National Lab., NM (USA)). May 1984. Contract W-7405-ENG-36. 39p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84014141.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report outlines the use of saturable inductors as switches in lumped-element, magnetic-pulse compression circuits. The operation of the three basic types of magnetic pulse compression circuits is discussed and the characteristic use of each is defined. In addition, the geometric constraints and magnetic pulse compression circuits used in short-pulse, low-inductance systems are considered. The scaling of presaturation leakage currents, magnetic energy losses, and switching times with geometrical and material parameters are developed to aid in evaluating magnetic pulse compression systems in a particular application. Finally, a scheme for increasing the coupling coefficient in saturable stripline transformers is proposed to enable their use in the short-pulse, high-voltage regime.

33919 **(LA-UR—84-1962) Geometry, contact, surface, and optical developments for photoconductive power switches.** Nunnally, W.C.; Hammond, R.B.; Wagner, R.S. (Los Alamos National Lab., NM (USA)). 1984. Contract W-7405-ENG-36. 6p. (CONF-8406137—9). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84014036.

From 16. power modulator symposium; Arlington, VA, USA (17 Jun 1984).

Portions are illegible in microfiche products.

Photoconductive Power Switches (PCPSs) have the advantages of precise control, extremely fast closure times, extremely low inductances and scalability to very high voltages and currents. PCPSs have these advantages because the size or power of the switch is not related to its closure time. The closure time is determined by the external optical source that uniformly illuminates the PCPS between the electrodes. Because carriers are generated uniformly between the electrodes at the desired density, current can flow through the switch immediately without waiting for carrier transient delays. The operating voltage is determined by the switch length l, and the operating current is determined by the switch width w. The electrodes can be made as wide as desired so that the inductance can be extremely low, or the area available for heat removal can be increased and the entire switch brough into conduction at the same instant if the same optical pulse and path length are used. This paper describes recent research at Los Alamos that has improved PCPS contact fabrication technology, has developed a simple optical control illumination system using fiber optics and rectangular optics, and has improved photoconductor surface fabrication methods and processes for high electric field operation.

33920 **(ORNL/TM—9213) INTERMD: a computer program to predict intermodulation product generation on two-way FM radio frequencies.** Russell, J.A.; Case, A.L. (Oak Ridge National Lab., TN (USA)). Jul 1984. Contract AC05-84OR21400. 12p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013767.

This report describes a computer program which was developed at the Oak Ridge National Laboratory to perform calculations on groups of two-way FM radio frequency assignments to determine if interference might be generated when two or more of the networks are used at the same time. Intermodulation products can be generated in a variety of ways, but the results have the same effect: the radio frequency signal generated appears to the receiver as a signal that cannot be distinguished from a signal actually transmitted on the receiver's input frequency. The purpose of INTERMD, the computer program described here, is to enable rapid determination, by calculation, of possible frequency combinations which could cause interference.

33921 **(SAND—83-2434C) Self-breakdown spark gap stability under rep-rate conditions.** Rinehart, L.F.; Buttram, M.T. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 9p. (CONF-8406137—4). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013126.

From 16. power modulator symposium; Arlington, VA, USA (17 Jun 1984).

Portions are illegible in microfiche products.

We have measured the statistical distribution of self-breakdown voltages of a spark gap at very low repetition rates (< 1 Hz) and at 20 and 40 pulses per second. For the high repetition rate experiments, the test switch discharged a resistively charged energy storage capacitor into a resistive load producing a simple R-C relaxation waveform across the spark gap. Typical discharge parameters were in the 10 to 35 kV, 10 to 20 kA range with about 1 μs pulse width. For the low rate work, a 20% reversal ringing waveform was used to reach higher discharge currents (up to 100 kA). An on-line computer data acquisition system was used to record and process large numbers of breakdowns, thus producing good statistical samples. The data show two distinct instabilities. At high

currents (> 30 kA) those data that have a single simple distribution are of an extreme value form that is skewed toward low voltage. At low currents and higher repetition rates, the data evolve from a narrow dc (single pulse) breakdown voltage distribution into a broader Gaussian distribution at 20 pulses per second (pps) and finally to a very broad bimodal distribution (two Gaussians) at 40 pps. At 40 pps some firings occur as low as 30% of the mean. Effects of pressure and flow rate on the distributions are presented, and we discuss possible explanations for the origins of the distributions and their behavior.

33922 **(SAND—84-0353C) Dielectric breakdown distributions of large dielectric constant liquids.** Zutavern, F.J.; Buttram, M.T.; O'Malley, M.W. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 22p. (CONF-8406137—6). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013216.

From 16. power modulator symposium; Arlington, VA, USA (17 Jun 1984).

Portions are illegible in microfiche products.

This paper reports area and time dependent dielectric breakdown distributions of ethylene glycol and water solutions cooled to -23°C. Electrode areas of 80, 400, 2000, and 10,000 cm^2 spaced 1 cm apart were repeatedly stressed with voltage pulses exponentially decaying in 5 to 20 ms. Approximately 80,000 measurements concentrated at electric field strengths near the 1% breakdown probability region of the samples were taken in order to obtain statistically accurate data on the dielectric strength of this liquid.

33923 **(UCRL—90154) Large aperture electro-optical switch.** Goldhar, J.; Henesian, M.A. (Lawrence Livermore National Lab., CA (USA)). 19 Dec 1984. Contract W-7405-ENG-48. 9p. (CONF-840629—4). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013089.

From 13. international quantum electronics conference; Anaheim, CA, USA (18 Jun 1984).

A transparent plasma electrode formed in low pressure ionized gas acts as a conductive coating to allow the uniform charging of the optical faces of an electro-optic material. Experiments with large aperture Pockels cells up to 27 cm are now in progress.

33924 **(UCRL—90295) Wafer-scale laser pantography. VI. Direct-write interconnection of VLSI gate arrays.** McWilliams, B.M.; Chin, H.W.; Herman, I.P.; Hyde, R.A.; Mitlitsky, F.; Whitehead, J.C.; Wood, L.L. (Lawrence Livermore National Lab., CA (USA)). 25 Jan 1984. Contract W-7405-ENG-48. 14p. (CONF-840139—6). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012676.

From SPIE technical symposium and instrument exhibit; Los Angeles, CA, USA (22 Jan 1984).

Portions are illegible in microfiche products.

General principles of laser direct-write deposition processes are reviewed: Device interconnection of CMOS gate arrays by means of computer-controlled, laser-induced thermochemical surface reactions is described. Interconnection quality parameters are related, and processing rate considerations are discussed.

4209 Waste Processing Plants And Equipment

33925 **(BMFT-FB-T—83-288) Recycling of various types of solvents, construction of a pilot plant, daily throughput: 8-10 tons.** Heyers, H.H. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Dec 1983. 46p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84751276.

Portions are illegible in microfiche products.

1) Large quantities of solvents, in particular halocarbons, are still incinerated at sea because the substances dissolved in them prevent recycling. 2) It was the aim and purpose of the research work to also reprocess and recycle such "problem solvents". 3) The fundamental prerequisites for the construction of a pilot plant were elaborated on the laboratory scale and the plant was then erected and tests carried out. 4) The specific design of the plant makes it possible also to distil off solvents which are partially polymerized or resinous. The residue is plastic or compact. In order to reduce costs, slightly contaminated, inflammable solvents which are not expensive enough to justify reprocessing can be used. 5) The principle underlying our plant permits economic reprocessing of solvents which have to date been incinerated at sea due to their heavy contamination.

33926 **(BMFT-FB-T—83-314) Construction and development of a resource recovery facility for household waste and commercial waste on a sanitary landfill.** Flender, H.F.; Trienekens, M. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Dec 1983. 154p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84751284.

Portions are illegible in microfiche products.

In October 1981 the first resource recovery facility for household and commercial waste, working on an technical scale, went into operation on an controlled sanitary landfilling, run by the M. Trienekens Company, Neuss, acting on behalf of the City of Neuss. The plant-promoted by the Minister for Research and Technology under assistance of the Federal Bureau of Pollution Control has a throughput capacity of 50 t/h household waste and 6.5 t/h commercial waste; the reclaimed products: paper (3 different qualites), plastics (foils), scrap, non-iron-scrap are sold directly for reprocessing to industry. The produced compost is used for land-recultivation purposes. The facility (dry processing) works satisfactory concerning machinery and quality of the products. The savable volume of the deposit amounts to 70-75%, with respect to the recyclable refuse. It is reported on the concept of waste disposal, the structure of marketing systems, the process-development and the first experiences of plant-operation.

33927 **(PB—84-157072) Profile of existing hazardous waste incineration facilities and manufacturers in the United States. Final report.** Keitz, E.; Vogel, G.; Holberger, R.; Boberschmidt, L. (Mitre Corp., McLean, VA (USA)). Feb 1984. 167p. NTIS, PC A08/MF A01.

A wide variety of technical data pertaining to hazardous waste incinerators has been obtained both from incinerator manufacturers and facilities operating hazardous waste incinerators. This document discusses the data gathering and verification procedures and presents tabulations of the data. It is estimated that there are approximately 350 operational hazardous waste incinerators at 270 facilities in the United States which are subject to regulation under the Resource Conservation and Recovery Act.

4210 Combustion Systems

REFER ALSO TO CITATION(S) 32683, 32845, 33536

33928 **(AD-A—139961/7) Electrical spray modification with various fuels in a T-56 combustor. Contractor report.** Zajdman, A. (Naval Postgraduate School, Monterey, CA (USA)). Mar 1984. 74p. (NPS—67-83-003CR). NTIS, PC A04/MF A01.

The possibility of electrically altering the droplet size distribution and injection cone angle of gas turbine fuel injectors has been investigated. The work was carried out both in a combustor rig incorporating a T-56 combustor liner/nozzle and in a non-burning spray optical absorption apparatus into each of which a high voltage electrode could be introduced. Several electrode designs were investigated in an effort to minimize flameholding and subsequent electrical shot circuiting. Fuels investigated included JP-4, the design fuel, JET-A, JP-5, and Diesel Fuel Number 2. Results of the optical experiments indicated reductions in the Sauter Mean Diameter of 7.7 percent. Results of the combustion experiments indicated increases in combustor efficiency of up to 3.6 percent for Diesel Fuel Number 2 and increases up to 0.6 percent for JP-4.

33929 **(DOE/ET/12307—1431) Design, construction, operation and evaluation of a prototype culm combustion boiler/heater unit. Quarterly technical progress report, April 1-June 30, 1982.** (Curtiss-Wright Corp., Wood-Ridge, NJ (USA)). Aug 1982. Contract AC21-78ET12307. 23p. (CW-WR—78-036.65). NTIS, PC A02/MF A01. Order Number DE84001061.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report provides a summary of the work performed on the prototype Culm Combustion Boiler/Heater Unit, Phase I - Engineering Design and Analysis, Phase II - Prototype Plant Construction and Phase III - Start-Up and Operation during the period April 1, 1982 through June 30, 1982. The objectives of the program as well as the technical progress and problem areas encountered during the reporting period are presented. The Parametric Test Program was resumed in April and completed during this report period. A total of 17 parametric test points have now been completed. During severe weather conditions (heavy rain), temporary delays were encountered due to the inability to crush sufficient amounts of culm for individual test points. Upon completion of the scheduled facility shutdown for maintenance, as discussed in the last report, the plant was restarted on April 5, 1982. Total operating time through the end of this quarter - 4272 hours, 29 minutes; operating time on culm/limestone and culm - 3379 hours, 15 minutes. Plant operating time during this report period - 1642 hours, 30 minutes with an operational running factor of 98.1% achieved during the month of June. Steam was delivered to the user (Cellu products) during this time to generate steam revenue. Data obtained during the Parametric Test Program was recorded on magnetic tape and this data was forwarded to DOE for their analysis.

33930 **(DOE/MC/19328—1320) Advanced atmospheric fluidized-bed combustion design-spouted bed. Final report.** Weller, A.E.; Murphy, M.J.; Schlaechter, J.; Shirley, F.W.; Dawson, W.J. (Battelle Columbus Labs., OH (USA)). 20 Dec 1982. Contract AC21-82MC19328. 119p. NTIS, PC A06/MF A01. Order Number DE83005060.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A concept design for a spouted bed combustor/boiler was developed. The concept is based on a mechanical design derived from a fire-tube boiler and is thus restricted to relatively small boilers (say, 20,000 lb/hr and below) generating saturated steam at 250 psig or less. The spouted bed combustor/boiler is projected as having a number of advantages compared to conventional atmospheric fluidized bed combustion. These are greater turndown capability, improved calcium utilization, elimination of the need to withdraw solids, and a single point fuel feed. The spouted bed combustor shares the great fuel flexibility of the conventional fluidized bed combustor. Various coals, wood chips or waste and low grade solid, liquid and gaseous fuels can be burned. An R and D program to carry development of the spouted bed combustor/boiler through the PDU stage is provided. Also, recommendations for the design of a multiuse PDU support facility are made.

33931 **(N—8419495) Combustion characteristics in the transition region of liquid fuel sprays.** Cernansky, N.P.; Namer, I.; Tidona, R.J. (Drexel Univ., Philadelphia, PA (USA)). Jan 1984. 28p. (NASA-CR—175396). NTIS, PC A03/MF A01.

A number of important effects were observed in the droplet size transition region in spray combustion systems. In this region, where the mechanism of flame propagation is transformed from diffusive to premixed dominated combustion, the following effects have been observed: (1) maxima in burning velocity (2) extension of flammability limits (3) minima in ignition energy and (4) minima in NO(x) formation. Unfortunately, because of differences in experimental facilities and limitations in the ranges of experimental data, a unified description of these transition region effects is not available at this time. Consequently, a fundamental experimental investigation was initiated to study the effect of droplet size, size distribution, and operating parameters on these transition region phenomena in a single well controlled spray combustion facility.

33932 **(PB—84-179720) Firetube boiler fiber burner demonstration program. Annual report Sep 82-Oct 83.** Krill, W.V.; Kesselring, J.P. (Alzeta Corp., Mountain View, CA (USA)). Nov 1983. 80p. (R—83-703-102). NTIS, PC A05/MF A01.

First year activities of a 26 month program to demonstrate the durability of the radiant fiber burner in gas-fired firetube boilers are presented. These activities include selection of four industrial test sites, testing of a prototype segmented burner, design, construction, and installation of the four field test units, and field testing of the boilers with both conventional and fiber burners. The burner designs and potential control schemes for achieving various turndown capabilities are discussed. The unique aspects of each test site and installation are described, and the test results and benefits over the first seven months of testing are presented. Future plans for further burner modifications to reduce cost and enhance reliability are identified.

33933 **(PB—84-179738) Advanced furnace concepts - commercial unit heater. Annual report Sep 82-Oct 83.** Gotterba, J.A.; Schreiber, R.J.; Kesselring, J.P. (Alzeta Corp., Mountain View, CA (USA)). Oct 1983. 184p. (R—83-702-101). NTIS, PC A09/MF A01.

The first year of this planned 2.5 year project has been completed. The project's objective is to accelerate the commercialization of an advanced, condensing, commercial warm air furnace, or unit heater. The heater will use a gas-fired infrared fiber burner manufactured by the performing organization. The first activity was the performance comparison between a conventional heater and the same heater retrofit with a fiber burner. The new burner achieved an 80 percent decrease in NOx emissions, a significant drop in noise output and no adverse effect on thermal efficiency. After these promising retrofit results, the heat exchanger was modified in various ways to attempt to achieve condensing operation. Higher efficiency was attained when the conventional heat exchanger was inverted and an additional convective tube bundle was installed upstream of the room air blowers. Activities during the project's second year will include evaluating this modified heater in the field, and using the results to design, fabricate, and field-evaluate an entirely new heater using the fiber burner and a condensing heat exchanger.

4220 Underground Engineering

33934 **(BMFT-FB-T—84-009) Development and testing of a new support-integrated system for heading roads in coal and rock.** Boermann, P. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.); Ruhrkohle A.G., Essen (Germany, F.R.)). Jan 1984. 87p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751280.

Portions are illegible in microfiche products.

The project initially covered the development of a so-called "roadway helix" for rectangular (porch set) and arch-shaped roadways. In the concept phase it was found that it would be impossible to accomplish the assigned task by a single system design. The project, therefore, was subdivided, and priority was given to the development of an efficient point attack machine for heading arch-shaped roadways into the rock. Due to the budgetary situation of the Federal Government, the cancellation of the project with date of December 31st, 1980, was asked for. Due to the contractual obligations Ruhrkohle AG had engaged meanwhile, the system testing of the TSM E 200 machine which Messrs. Paurat was at the point of supplying was approved for a period ending December 31st, 1982. In June 1981 the machine started operation on the 703 m level of Rossenray colliery. In heading operations it was found that the machine actually can cut into rock which, due to its content of abrasive minerals, was previously deamed to be out of application scope of cutting machines, however, that the tool costs were beyond of economic viability. Due to the difficult geological conditions, the heading performance up to present was 1.17 fm^3/min only.

33935 **(CONF-8405144—3) Hydrogeologic assessment of zone-of-saturation landfill design.** Smith, E.D. (Oak Ridge National Lab., TN (USA)). 1984. Contract AC05-84OR21400. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012356.

From International groundwater symposium; Montreal, Quebec, Canada (21 May 1984).

Portions are illegible in microfiche products.

Disposal of solid waste below the water table violates most conventional wisdom on sound waste disposal practice, which holds that solid wastes should be isolated from groundwater to min-

imize leachate generation and to allow migrating leachate to be attenuated by passage though unsaturated soil before it reaches the water table. In the State of Wisconsin (USA), however, landfilling in the zone of saturation has become an accepted practice in low-permeability hydrogeologic settings, where conditions appear to make it possible to prevent leachate from escaping the landfill by controlling hydraulic gradients. This paper explores the merits and drawbacks of this novel landfill design concept, based on fundamental hydrogeologic concepts and on some lessons learned from the 10-year record of operation of zone-of-saturation landfills in Wisconsin. 19 references.

33936 **(NP—4770333) Annual report of the Clausthal-Zellerfeld Board of Mines 1982.** (Oberbergamt Clausthal-Zellerfeld (Germany, F.R.)). 1982. 189p. (In German). NTIS (US Sales Only), PC A10/MF A01. Order Number DE84770333.

Portions are illegible in microfiche products.

In the Board of Mines district that includes Lower Saxony, Schleswig-Holstein, Hamburg, Bremen and Berlin the value of extraction increased by 839 million DM to 8.362 thousand million DM, which is a 400% increase within 10 years. 258 (246) mines were under the control of the Board of Mines, with 16859 employees 714 of which were foreigners. In the year under report, the last mine extracting iron ore was shut down in Haverlahwiese. The raised and weighed tonnage in metal ore increased by 0.6%, yet the utilizable amount decreased by 2.9% to 135765 tons. Examinations of deposits were successful at the "Hilfe Gottes" mine. Activities at the underground storage plants for natural gas and petroleum equaled the figures of the preceding year; 200 were employed. At the "Schachtanlage Konrad" a closing report of investigations carried out by the German Radiation and Environment Research Association concluded that the mine qualifies for the ultimate storage of slightly radioactive waste and waste from decommissioning of nuclear facilities. As for regional policy planning, it took a great deal of effort to guarantee that the public interest in mining is given due consideration, so that mining project requiring a lot of space are on principle practicable in the future.

33937 **(GKSS—83/E/24) MIG-welding of offshore steels at pressures from 1 to 30 bar.** Terlinde, G.T.; Mueller, L.G.; Schwalbe, K.H.; Beaven, P.A.; Szelagowski, P. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1983. 10p. (CONF-830514—2). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751288.

From Offshore technology conference; Houston, TX, USA (2 May 1983).

Portions are illegible in microfiche products.

Hyperbaric welding was performed in an unmanned chamber at pressures up to 30 bar (300 m depth). A flux-cored and a solid wire were used as consumables; two typical offshore steels served as base materials. The study, which mainly focussed on the weld metal properties, included chemical analysis, detailed microstructural characterization, tensile and charpy impact testing, and for selected conditions a fracture mechanics analysis. When using argon as pressurizing gas, the impact toughness decreases only slightly at higher pressures (<15%); the room temperature tensile properties and COD values for crack growth initiation show no pressure dependence. The solid wire has slightly lower impact toughness values than the flux-cored wire. An attempt is made to explain the mechanical properties on the basis of the observed microstructures.

4240 Pollution Control Equipment

REFER ALSO TO CITATION(S) 34230

33938 **(BMFT-FB-T—84-069) Ground probing of contaminated sites.** Feld, R.; Kaul, J.; Kimball, S.; Koennecke, R.; Sandness, G.; Stammler, M. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). 1984. 132p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84751776.

Portions are illegible in microfiche products.

Using geophysical methods such as radar probing, determination of ground conductivity by electromagnetic induction and recording of magnetic anomalies, 11 contaminated sites were investigated. The objective was to detect and locate deposited contaminantes, burried objects and pathways of pollution plumes. The application procedures of these methods are described. The proposed future development of the methods is to improve data collection systems and analysis.

33939 **(NE/FBA—83-17) Review and evaluation of novel flue gas purification technology for advanced flue gas purification.** Nilsson, B. (Naemnden foer Energiproduktionsforskning, Stockholm (Sweden)). 1983. 203p. (In Swedish). NTIS (US Sales Only), PC A10/MF A01. Order Number DE84751018.

Portions are illegible in microfiche products.

The methods for flue gas purification have been reviewed. Advanced purification is defined as a method giving 10% of the release wich is attained by todays technique. A considerable reduction of costs at the present day level of emissions may also be considered. The present methods are recommended to further studies: -UW Electrostatic Scrubber -Electrostatic fluidized bed -Elecrtoscrubber -Blocking filters -Electric filters -Radiation treatment (G.B.).

33940 **(PB—84-148766) Limestone scrubber slurry automatic control systems. Final report Mar 78-Mar 81.** Garrett, P.H. (Cincinnati Univ., OH (USA)). Jan 1984. 93p. NTIS, PC A05/MF A01.

The report utilizes current understanding of limestone scrubbers for flue gas desulfurization (FGD) to develop an effort into the optimization of automatic control for the recirculating slurry processes. The acknowledged methods of mathematical modeling, computer simulation, and experimental proofing are applied to the design of slurry limestone addition, slurry density, and absorber liquid-to-gas (L/G) ratio control systems. Three automatic control methods are analyzed for dense limestone feedrate to the recirculating slurry: stoichiometric control, pH control, and stoichiometric-assisted pH control. Absorber L/G ratio control for minimizing scrubber energy requirements while maintaining an SO_2 exit target is also designed, based on a feedforward SO_2 removal law and slurry pump selection.

A rough overview is given of the expectations for the extension of high energy colliders and accelerators into the xtremely high energy range. It appears likely that the SSC or something like it will be the last gasp of the conventional method of producing high energy proton-proton collisions using synchrotron rings with superconducting magnets. It is likely that LEP will be the highest energy $e+e^-$ colliding beam storage ring built. The future beyond that depends on the successful demonstrations of new technologies. The linear collider offers hope in this respect for some extension in energy for electrons, and maybe even for protons, but is too early to judge whether, by how much, or when such an extension will indeed take place.

From 8. All-union seminar on linear accelerators; Kharkov, Ukrainian SSR (1 Jun 1983).

Present-day requirements for radiotherapy equipment are considered. The recently developed linacs of LUE-5, LUE-25, LUE-15MM models, as well as a newly designed unified series of medical linacs of LUER-5M, LUER-20M, LUER-40M models are described in brief. The main scientific and technical problems that were solved during their construction, namely, development of accelerating structures, a radiation head, dosimetry equipment, a programming unit, a magnetic mirror etc. are described.

33951 (INIS-SU—221, pp 7-11) **"Fakel" accelerator work state and some results.** Petrenko, V.V.; Chernoplekov, N.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1983. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780353. (CONF-8306180—No.2(14)).

From 8. All-union seminar on linear accelerators; Kharkov, Ukrainian SSR (1 Jun 1983).

The operating condition of the "Dakel" accelerator and some systems for the two-year period (1981-1982) are analyzed. The physical research program is discussed and the results of using the operating time with beams for different branches of research (nuclear physics and neutron constants, physics of hydrogen in extreme conditions, radiation physics of semiconductors, radiation physics of electron channelling, accelerator physics and technology, synchrotron complex) are given. The up-dated accelerator systems are described; the most important ones increase of reliability and durability of modulator elements and clystron excitation power. The achieved beam parameters (e.g. at 20 ns pulse duration accelerated electron energy is 60 MeV, pulsed current is 5A) are presented. Information about the progress in synchrotron radiation source construction is given.

From 7. all-union seminar on linear accelerators; Kharkov, Ukrainian SSR (2 Jun 1981).

A circuit for control and stabilization of beammean current intended fop electron linear accelerator uynchponization system is suggested. Control and stabilization of mean current is exercised by change of the number of current pulses per unit of time at preservation of pulsed current and other beam parameters of accelerated electrons electrons without change. Change of the number of current pulses per unit of time is realized by delay of the necessary part of klystron startup pulses (KIU) of the source modulator in time in respect to moments of time of startup of the KIU accelerating sections. Control step of mean current is equal to 1.56%. Stabilization coefficient equals 64.

From 4. topical workshop on proton antiproton collider physics; Bern, Switzerland (5 Mar 1984).

Several unsolved problems concerning backgrounds prevent one from claiming that some particular signal is clearly observable. One of the most critical issues concerns the observability of W's and Z's from their decays into hadronic jets. Many signals for new physics involve final states with W's or Z's (e.g. the minimal Higgs discussed in D). If one is restricted to observing the W's and Z's via their leptonic modes (which may not be possible for final states involving more than one W) only a small number of events will be detected - 5000 Z pairs decaying into ee and $\mu\mu$ results in only 18 detected events. The physics background to hadronic decays of W and Z is from QCD events with multiple jets. In the case of final states with 4 jets we have no reliable QCD estimate. Many particle searches (e.g. supersymmetric ones) involve signals which have missing transverse momentum, so the importance of hermetic detectors with 4 π coverage cannot be overstated. The difference between a pp and a proton-antiproton collider is limited to a few special cases where the presence of valence antiquarks in the antiproton is important (for example is the production of a new W). In order to exploit this advantage a certain minimum luminosity is required. ($\sim 5 \times 10^{31}$ cm^{-2} sec^{-1} for $\sqrt{s} = 40$ TeV). A 40 TeV machine operating at a luminosity of at least 10^{33} cm^{-2} sec^{-1}, seems capable of answering the fundamental questions surrounding the breaking of weak interactions. The same assurance cannot be given for a 10 TeV Machine at the same luminosity. 23 references, 23 figures.

33966 (ORNL/TM—8669) Preliminary study of possible ORELA replacement options. Olsen, D.K.; Martin, J.A.; Horen, D.J. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 54p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE84013133.

Based on two conceptual design studies performed by the LANL Accelerator Technology Division, the possibilities in terms of accelerator systems for replacing ORELA with a more intense Maxwellian-type continuous-energy neutron source are summarized and discussed. The neutron intensities from ORELA are compared with those from existing or potential accelerator systems used for cross-section and condensed-matter studies. The best replacement options seem to involve a spallation source from 200- to 400-MeV protons on an ORELA-like target. Pulsing and intensity desiderata with such a source are discussed which correspond to a spectrum-averaged 100-fold improved figure of merit over ORELA for TOF measurements with only a tenfold increased source strength. Existing accelerator designs seem to be inadequate for such a source. Consequently, two conceptual designs were developed for this study by the LANL Accelerator Technology Division. The first conceptual design is for a 200-MeV large linac capable of accelerating 1.3 A during a macropulse; this linac standing alone could serve as an ORELA replacement source. The second conceptual design is for a much smaller 250-MeV PIGMI linac with a 28-mA macropulse current which feeds a proton accumulator ring and bunch-compressor transport line. This linac-ring-compressor (LIRIC) option would give a more cost-effective neutron source for cross-section measurements, whereas the large linac, or a modified version of it, would give a much simpler system more suitable for expansion. In particular, both conceptual designs would incorporate the present ORELA building and would provide approximately 100-fold improved neutron sources over ORELA for cross-section measurements. The total estimated cost of the LIRIC system would be $43M (1984), whereas the cost of the large linac would be about a factor of two more. 55 references, 11 figures, 19 tables.

From 16. power modulator symposium; Arlington, VA, USA (17 Jun 1984).

The Advanced Test Accelerator (ATA) has been operational for over one year and has achieved full parameters in the power conditioning system. The pulsed power system has been previously described, however, during the past year of operation a considerable amount of statistical data has been accumulated on the 211 gas blown spark gaps that perform the main switching function in the ATA. These spark gaps were designed for 250kV, 40 kA and 70ns pulse. The parameter that made this spark gap somewhat unique was the requirement that it be able to provide a burst of ten pulses at one kilohertz with an average repetition rate of 5Hz. 2 references, 7 figures.

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

Electron beams in the MeV to GeV energy range have been used for nuclear studies for the last thirty years. The precision of measurements made using electrons is sufficiently high that they are also now used as starting points for the analysis of data obtained using strongly interacting probes such as pions and protons. Virtually all measurements made to data have been of the inclusive variety. Enhancing the precision of such measurements, through such means as more accurate particle differentiation and improved time resolution, has meant making the duty factor of the beam as high as possible. The global interest in high duty factor electron accelerators has consequently risen. This paper groups both existing and proposed high duty factor accelerators into three categories. The first group covers those involving a pulsed accelerator and a pulse stretcher ring. The second category consists of machines based on the microtron concept. The third group includes the recirculated linac. The current proposals for high duty factor accelerators are divided into two groups: those involving the upgrade of an existing pulsed accelerator and those involving the construction of a new accelerator. The proposals for new accelerators are further categorized into those based on linac pulse stretcher combinations and those based on microtrons. This paper assesses the existing and proposed activities of these facilities as they currently stand at laboratories around the world.

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

A six-sided hexagonal microtron has been chosen as the accelerator to generate the beams required to pursue a national research program at a CW 4 GeV electron laboratory. This option has the advantages of superior beam quality, low capital and operating cost, and promise of furnishing beams of several electron energies simultaneously. Only moderate RF power is required because the electron beam will be accelerated through the same RF accelerating section many times. The hexatron design has the additional feature of compatibility with an existing accelerator complex at Argonne which is currently unoccupied and available. The basic components of the accelerator include an electron gun, chopper-buncher, a 23 MeV linac injector, a 23-185 MeV Racetrack Microtron, an interstage phase space matching section, a subharmonic cavity, a 185-400 MeV Six-Sided Microtron, extraction systems, and various transport lines. The 100 KeV beam will be injected into a 2 MeV linac capture section which will be followed by a 3 MeV preaccelerator section. Acceleration to 23 MeV will be accomplished by 8 sections of linac consisting of on-axis-coupled structure. The beam will be injected into the Racetrack Microtron and accelerated to 185 MeV in 27 revolutions with a 6 MeV gain per turn. This paper describes the design, operation and performance of the microtron and its components.

33971 Medium energy proton accelerator for therapy. Gottschalk, B. (Harvard Cyclotron Lab., 44 Oxford St., Cambridge, MA 02138). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: 3063-(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The Harvard Cyclotron Laboratory is designing a small synchrotron to make low-current adjustable-energy proton beams for radiotherapy. The specifications include an adjustable range of 50 to 250 MeV; an 0.1 microamp average in 10 pulses per second; a size of 6 by 6 meters; a weight of 5 tons; and a prototype cost of ca. $400 K. The magnet offers a field on design orbit of 1 KGauss (injection) and 12 KGauss (250 MeV); a four quadrant alternate-gradient 4 x (O d F D D d O) lattice; a bending radius of 2 m; a

gross radius of 3.2 m; four 2 m straight sections; split H laminations; and an aperture of 1.5 x 4.5 cm. The magnet coil consists of ca. 20 turns with a single coil per quadrant, is strip-wound and edge-cooled, and has an effective area of .0007 m^2. Its electrical and magnetic specifications are listed. The injector consists of an RFQ linac, matched to a DC beam at both ends, a 50 keV ion source, a partly lumped resonator, and is driven by Y690A planar triodes. While these and other specifications such as the rf characteristics and output energy are design rather than empirical specifications and are, therefore, subject to change, they serve to define the general character of the synchrotron.

33973 **(AD-A—137508/8) Modified betatron accelerator studies. Final report 1 Sep 81-31 Oct 83.** Hughes, T.P.; Godfrey, B.B.; Campbell, M.M. (Mission Research Corp., Albuquerque, NM (USA)). Dec 1983. 158p. NTIS, PC A08/MF A01.

Results of an extensive study of the modified betatron accelerators are reported. The topics are beam injection, equilibrium and stability. Three-dimensional particle simulations of injections were performed. The results show good agreement with theory. Various types of equilibria were studied using two dimensional simulations. Results are compared to the calculations of Finn and Manheimer. Beam stability is investigated using a combination of analytic and numerical techniques. Growth rates of the negative mass, resistive wall, beam breakup, and image displacement instabilities are calculated. A new theory of the negative mass instability, keeping toroidal corrections to Maxwell's equations, is derived. Good agreement between theory and simulations is obtained. The negative mass instability is shown to be the dominant instability. Simulations show that it can disrupt the beam in a time of order one microsecond. Stabilization may require a beam of large minor radius. Work on the other instabilities show that measures can be taken to make their effect negligible.

33974 **(BNL—34758) Software for large scale tracking studies.** Niederer, J. (Brookhaven National Lab., Upton, NY (USA)). May 1984. Contract AC02-76CH00016. 4p. (CONF-8405162—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013233.

From Symposium on recent developments in computing, processor, and software research for high-energy physics; Guanajuato, Mexico (8 May 1984).

Over the past few years, Brookhaven accelerator physicists have been adapting particle tracking programs in planning local storage rings, and lately for SSC reference designs. In addition, the Laboratory is actively considering upgrades to its AGS capabilities aimed at higher proton intensity, polarized proton beams, and heavy ion acceleration. Further activity concerns heavy ion transfer, a proposed booster, and most recently design studies for a heavy ion collider to join to this complex. Circumstances have thus encouraged a search for common features among design and modeling programs and their data, and the corresponding controls efforts among present and tentative machines. Using a version of PATRICIA with nonlinear forces as a vehicle, we have experimented with formal ways to describe accelerator lattice problems to computers as well as to speed up the calculations for large storage ring models. Code treated by straightforward reorganization has served for SSC explorations. The representation work has led to a relational data base centered program, LILA, which has desirable properties for dealing with the many thousands of rapidly changing variables in tracking and other model programs. 13 references.

Translated from Russian. Published as report JINR-P–2-83-157.

The low frequency part of the spectrum of the electromagnetic radiation arising at a change of the velocity direction of an ultrarelativistic charged particle within a certain section of the force field of finite length l is investigated. It is shown that the correction to the spectrum-angular density of radiation corresponding to an instantaneous change of velocity has magnitude of an order of (l/Lsub(F)) where Lsub(F) = $2cy^2/\omega(1+y^2\text{theta}=2)$ is the formation length, ω is the radiation frequency, y is the Lorentz-factor, theta is the angle between the longitudinal velocity of a particle and the direction of radiation. At the same time the correction to the spectrum density, after integrating over angles, turns out to be proportional to the length of an intermediate interval, but not to the square of this length.

In Technique of physical experiment.

The effect of electric field dipole component on ion motion in the accelerating system built on the base of two-wire resonator (according to the Videroe scheme), is considered. The dipole component is caused by the variable difference of potentials between the conductors of the resonator. The equation of motion is drawn which is investigated by analytical methods. Conditions for resonances excited by dipole component are obtained; the increase in ion oscillation amplitude relatively to equilibrium particle in the case of their motion under resonance conditions, are obtained.

From 8. All-union seminar on linear accelerators; Kharkov, Ukrainian SSR (1 Jun 1983).

The revieW presents the results of theoretical and experimental studies of accelerating field generation and electron beam acceleration by radial lines excited by an external pulsed generator carried out in the USSR and abroad in recent years. Various versions of accelerating structures, connection diagrams special for generating a nonpotential electpic field to design multi-gap accelerating systems are proposed in these papers. Different excitation circuits are considered and the possibility of reaching 100% efficiency of energy transfer to the beam is shown. As a result of theoretical studies it is shown that accelerating voltage per a cell significantly exceeding feeding voltage can be aenerated. The dependence of the effect on line parameters and excitation pulse is studied. The obtained results are verified in experiments when hundreds amp electron beams are accelerated in a single radial line and in a mUlti-gap system of radial lines, and its main regularities are studied. On the basis of the given method compact accelerators of electron beam with current of hundreds of amperes and pulse duration of several nanoseconds can be designed.

A review of methods for monoenergetic beam production in electron linacs for the recent years carried out in the USSR and abroad is presented. Results of theoretical and experimental investigations of operating systems of eperaetic beam compression in different accelerator centres are discussed. The main dependences of performance on differept beam parameters for such systems are given. A proposition concerning construction of energy phace compression systems is made. Some estimations are given for the systems. The possibilities of their utilization and advantages over the previously used methods for decreasing the bunch phase width and electron energy spread are pointed out.

34003 (ORNL/TM—8880) **ORELA flight path 1: determinations of its effective length vs energy, experimental energies, and energy resolution function and their uncertainties.** Larson, D.C.; Larson, N.M.; Harvey, J.A. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 95p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE84013594.

Flight path 1 at ORELA is nominally 200 m in length and has been extensively used for neutron transmission and scattering measurements. Due to moderation effects in the neutron-producing target and to the finite thickness of the neutron detector, the effective flight-path length is a function of neutron energy. In this report, we determine the effective length as a function of energy, its uncertainty, and time-of-flight energies and their uncertainties. Finally, we determine the resolution function and its uncertainty and compare the width of this resolution function with an experimental determination of this quantity. 9 references, 5 figures, 4 tables.

The ATA provides an electron beam pulse of 70-ns duration at a 1-Hz rate. Our present optical diagnostics technique involve the imaging of the visible light generated by the beam incident onto the plant of a thin sheet of material. It has already been demonstrated that the light generated has a sufficiently fast temporal reponse in performing beam diagnostics. Notwithstanding possible beam emittance degradation due to scattering in the thin sheet, the observation of beam spatial profiles with relatively high efficiencies has provided data complementary to that obtained from beam wall current monitors and from various x-ray probes and other electrical probes. The optical image sensor consists of a gated, intensified television system. The gate pulse of the image intensifier can be appropriately delayed to give frames that are time-positioned from the head to the tail of the beam with a minimum gate time of 5-ns. The spatial correlation of the time frames from pulse to pulse is very good for a stable electron beam; however, when instabilities do occur, it is difficult to properly assess the spatial composition of the head and the tail of the beam on a pulse-to-pulse basis. Multiple gating within a pulse duration becomes desirable but cannot be performed because the recycle time (20-ms) of the TV system is much longer than the beam pulse. For this reason we have developed an optical-loop framing technique that will allow the recording of two frames within one pulse duration with our present gated/intensified TV system.

34005 (UCRL—90886) **TV-acquired optical diagnostics systems on ATA.** Kalibjian, R.; Chong, Y.P.; Cornish, J.P.; Jackson, C.H.; Fessenden, T.J. (Lawrence Livermore National Lab., CA (USA)). Jun 1984. Contract W-7405-ENG-48. 6p. (CONF-8406133—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013335.

From DARPA propagation meeting; Monterey, CA, USA (18 Jun 1984).

The purpose of this paper is to report on optical system developments on the ATA and their applications to ATA beam characterization. Television (TV)-acquired optical diagnostics data provide spatial and temporal properties of the ATA beam that complements recorded information from other types of sensors, such as, beam-wall current monitors, x-ray probes, and rf probes. The ATA beam operates: (1) in the normal mode at 50-MeV, 10-kA at a 1-Hz

rate; and (2) in the 1-KHz burst mode (for 10-pulses) at a 0.5 Hz rate. The beam has a 70-ns pulse width in vacuum propagation; however, beam-head erosion will occur in atmospheric propagation, thus limiting the pulse width to less than 50-ns. Various optical systems are used for ATA diagnostics. Optical-imaging provides a convenient measurement in a single pulse of the 2-dimensional profile of the beam intensity. It can also provide multiple 2-D framing in a single pulse. In some studies it may be desirable to study optical events with temporal resolution less than 100-ps with 1-dimensional streak cameras. Spatially integrated data from phototube cameras can also be used for background measurement applications as well as for single pixel monitoring. The optical line-of-sight (LOS) configurations have been made versatile to accommodate a large number of options for the various optical systems.

34006 **High frequency free-electron laser results.** Boyer, K.; Brau, C.A.; Newman, B.E.; Stein, W.E.; Warren, R.W.; Winston, J.G.; Young, L.M. (Chem. Division Univ. of California, Los Alamos Nat'l Lab., Los Alamos, NM 87545). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3076-3077(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

By looking at the free-electron laser as a particle accelerator working backwards, Morton realized that the techniques used to accelerate particles could be used to improve the performance of free-electron lasers. In particular, he predicted the capture of electrons in "stable-phase" regions, or "buckets" in the electron phase space, and proposed that by decelerating the buckets, the trapped electrons could be decelerated to extract significant amounts of their energy as optical radiation. In fact, since electrons not trapped in the stable regions are forever excluded from them--at least in the adiabatic approximation--displacement techniques could also be used to accelerate or decelerate electrons in a free-electron laser. This paper explains the principle behind "phase-displacement" acceleration and details an experiment carried out with a 20-MeV electron beam to test these predictions. Results obtained with a tapered-wiggler free-electron laser demonstrate the concepts proposed by Morton for enhanced efficiency. They show deceleration of electrons by as much as 7% and extraction of more than 3% of the total electron-beam energy as laser energy when the laser is operated as an amplifier. The experiment is presently being reconfigured to examine its performance as a laser oscillator.

34007 **Polarization preservation in the AGS.** Ratner, L.G. (Accelerator Dep.'t Brookhaven Nat.'l Lab., Assoc. Universities, Inc.). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 2690-2692(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The successful operation of a high energy polarized beam at the Argonne Zero Gradient Synchrotron with the concommitant development of depolarizing resonance correction techniques has led to the present project of commissioning such a beam at the Brookhaven AGS. A description of the project was presented at the 1981 National Accelerator Conference. The current paper presents a more detailed description of how Brookhaven personnel plan to preserve the polarization during acceleration and how they intend to tune through some 50 resonances and reach their goal of a 26 GeV polarized proton beam with greater than 60% polarization. Some aspects of their resonance correction techniques are to cross resonances by fast passage and not rely on spin-flip; to use the slow AGS tune shifting quadrupoles to avoid hitting integer or half-integer resonances at v = 9.0 and 8.5; and to pulse the ring sextupoles in order to flatten the vertical tune profile and keep the total tune shift constant as a function of radius. They are also prepared to use a compensating horizontal (v /SUB x/) shift during the correction time should this prove necessary.

34008 **SRA: a new ion accelerator scheme.** Choe, J.Y.; Uhm, H.S. (Naval Surface Weapons Cntr., White Oak, Silver Spring, Maryland 20910). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3174-3176(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The space-charge resonance accelerator consists of a relativistic electron beam propagating through a dielectric loaded drift tube. In a range of physical parameters, the phase velocity of a self-growing space-charge wave increases slowly from zero to a large beam velocity as it propagates into the downstream region, thereby trapping and accelerating ions with its electric field. The self-growing mechanism of the space-charge wave is a typical Cherenkov radiation. This paper presents schematics and calculation methods which describe the accelerator, its dynamics, and its fields.

34009 **Adjustable strength REC quadrupoles.** Gluckstern, R.L.; Holsinger, R.F. (Phys. Dept., Univ. of Maryland, College Park, Maryland 20742). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3326-3329(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The development of high field rare earth cobalt (REC) permanent magnet materials has led to the development of rings which produce high field quadrupoles used primarily to focus charged particle beams. In a previous paper the authors demonstrated that adjustable magnets can be constructed by suitable rotation of the disks in a multi-disk quadrupole configuration. They used general symmetry considerations to show that a five disk singlet or four disk doublet could be adjusted to eliminate all coupling effects between the two transverse directions to lowest order in the transverse displacements. In this paper the authors obtain an expansion of all matrix elements up to and including terms of second order in the magnet strength. These results suggest a non-uniform choice of disk thicknesses which leads to a particularly simple prescription for the rotations. The accuracy of these suggestions is then confirmed by numerical computations which include the effects of known fringing fields from an REC ring. The authors conclude that fringing fields have almost no influence on the prescription of rotation angles, which eliminates coupling between the two transverse fields, and that they do not affect the focal strength of the total configurations in lowest order. The primary effect of the fringing fields is shown to be a shift in the principal planes as is the case for single quadrupole rings.

34010 **Undulators as sources of synchrotron radiation.** Krinsky, S. (Nat.'l Synchrotron Light Source, Brookhaven Nat.'l Lab., Upton, NY 11973). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3078-3082(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

It is reasonable to expect that in the coming years the importance of wigglers and undulators to facilities with electron storage rings designed for and dedicated to synchrotron radiation research will increase. This paper discusses some of the properties of the radiation from these devices and some of the considerations which arise in their design and use in storage rings. The properties of wiggler radiation are describable in terms of the characteristics of synchrotron radiation from arc sources. These characteristics are well-known and well-documented. Undulator radiation, on the other hand, is less familiar, and thus receives the emphasis of this paper, which first reviews the spectral properties of the radiation and the complementary aspects of time-domain and frequency-domain analyses, then explores the brightness of the undulator source, and finally considers some limitations associated with operating an undulator in a storage ring.

34011 **Generation, focusing and transport of intense light ion beams.** Goldstein, S.A. (JAYCOR, Alexandria, VA). pp 417-421 of Energy storage, compression, and switching. Nardi, V.; Bostick, W.H.; Sahlin, H. New York, NY; Plenum Publishing Corp. (1983). (CONF-751247—).

From Colloquium on thermal insulators at high temperature; Paris, France (3 Dec 1975).

This chapter describes the essentials of the ultra-high current density approach, the studies that have been performed to date and future possibilities. Most of the discussion is based on the recent advances made at the Naval Research Laboratory (NRL). The origi-

nal studies at NRL have resulted from the experimental and theoretical studies of the pinch phenomenon in high aspect ratio diodes.

From International symposium on in-beam nuclear spectroscopy; Debrecen, Hungary (14 May 1984).

TRISTAN is an on-line isotope separator (ISOL) facility located at Brookhaven National Laboratory's High Flux Beam Reactor. Short-lived neutron-rich nuclei, far from stability, are produced by thermal neutron fission of ^{235}U. These nuclei can be studied using facilities at the five available beam lines. These facilities include: a 4-detector angular correlation system, a delayed neutron spectroscopy facility, a conversion electron detector, a colinear fast beam dye laser system and a superconducting magnet for g-factor measurements. Ion sources of the surface ionization, negative surface ionization, thermal, FEBIAD, and plasma types are used to provide high yields over a wide range of elments for experiments at the available detector stations.

34014 **(CONF-8404170—1) Rare particles.** Kutschera, W. (Argonne National Lab., IL (USA)). 1984. Contract W-31-109-ENG-38. 20p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013439.

From 3. international symposium on acceleration mass; Zurich, Switzerland (10 Apr 1984).

The use of Accelerator Mass Spectrometry (AMS) to search for hypothetical particles and known particles of rare processes is discussed. The hypothetical particles considered include fractionally charged particles, anomalously heavy isotopes, and superheavy elements. The known particles produced in rare processes discussed include doubly-charged negative ions, counting neutrino-produced atoms in detectors for solar neutrino detection, and the spontaneous emission of ^{14}C from ^{223}Ra. 35 references. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Nov 1983. 22p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751489.

Translated from Russian. Published as report IFVE--83-86.

Hadron fluences have been measured under deep penetration conditions within the energy range from thermal neutrons to 20 MeV by means of activation detectors inside a steel block absorbing narrow 69 GeV/c proton beams.

34016 **(DOE/ER/40017—7) Parity violating weak neutral current effects in elastic e-^{12}C scattering. Progress report, January 1, 1983-April 15, 1984.** Lubell, M.S. (City Coll., New York (USA)). 21 Apr 1984. Contract AC02-81ER40017. 10p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84014095.

The polarized electron source, which was designed at Yale, features full compatibility with the MIT-Bates accelerator with an injection energy of 365 keV, matching time structures, a ~ 1% duty cycle, and peak beam intensities in the range of 5 to 50 mA peak current. The experimental method utilizes photoemission from a GaAs crystal prepared to have a negative electron affinity in an ultrahigh vacuum system with base pressures of 10^{-10} torr or below. A high power continuous wave krypton-ion laser in conjunction with electro-optical instrumentation to chop the beam and to allow random polarization reversal is used as a light source.

34024 (INIS-SU—221, pp 3-6) **Kharkov 2 GeV linac exploitation and modernization results in 1981-1982 years.** Antipov, K.I.; Artemov, V.I.; Demidov, N.V. (and others). 1983. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780353. (CONF-8306180—No.2(14)).

From 8. All-union seminar on linear accelerators; Kharkov, Ukrainian SSR (1 Jun 1983).

Some up-dated features of the 2 GeV linac systems, changes in beam parameters and new operating modes are described. The beam absorber design and biological shielding are modernized; a new injector with a removable source is installed; the synchronization system allowing to realize the operating mode at two frequencies of 100 and 50 Hz simultaneously is up-dated; the waveguide line seals are replaced. Using the modernized units the 53 mA pulse current is obtained at the accelerator output at 1450 MeV energy and 1.6 μs pulse duration. In view of expanding the scope of experiments on physics of crystals a new mode with low divergence and intensity Up to (1-2)x10^{-10} A is worked out. The reliability factors and effective accelerator time are presented.

34094 **(LA—10051-MS) Need for an intense polarized source at LAMPF. Report on a workshop held at Los Alamos, November 9, 1983.** McNaughton, M.W.; Silbar, R.R.; van Dyck, O.B. (Los Alamos National Lab., NM (USA)). Apr 1984. Contract W-7405-ENG-36. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84014138.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

We report on a workshop to consider the need for an intense polarized source at LAMPF. The primary justification for such a source comes from the nucleon-nucleon program; neutron-proton scattering is seriously underdetermined and cannot be satisfactorily completed without such an intense source. Further justification comes from nuclear (vector n,p) and (vector p, vector n) reactions, as well as from traditional nuclear physics at the LAMPF high resolution spectrometer. We recommend that a source capable of providing a few μA beam on target be built as soon as possible.

34095 **(LBL—17068) Progress on the LBL ECR heavy ion source.** Clark, D.J.; Jongen, Y.; Lyneis, C.M. (Lawrence Berkeley Lab., CA (USA)). Apr 1984. Contract AC03-76SF00098. 6p. (CONF-8404143—7). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013394.

From 10. international conference on cyclotrons and their applications; East Lansing, MI, USA (30 Apr 1984).

Portions are illegible in microfiche products.

The LBL ECR ion source, which began test operation in January 1984, has already produced a variety of high charge state heavy ion beams of sufficient intensity for cyclotron operation, although actual use must wait for completion of the beam transport system. The source has produced 40 μA of O^{6+}, 2 μA of O^{7+}, 40 μA of Ar^{8+}, and 0.20 μA of Ar^{12+}. The source development has centered on optimizing source performance with modifications and parameter tuning. Future plans include construction of an $SmCo_5$ octupole structure, and testing of solid feed techniques. The construction of the beam transport line and calculations on center region geometry for heavy ion axial injection into the 88-Inch Cyclotron are also underway.

34096 **(SLAC/AP—23) Coating of the SLAC klystron windows.** Krienen, F. (Stanford Linear Accelerator Center, CA (USA)). 23 May 1984. Contract AC03-76SF00515. 6p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013508.

Secondary emission is not likely to be suppressed in thin films. Accumulated charges leak away with two time constants. The fast time constant should be short compared to the pulse duration, and the slow time constant should be short compared to the time between pulses. The Joule heating may be prohibitive in reaching adequate charge removal. The joule heating may be reduced by films which conduct little in the direction of the electric field and much better in the perpendicular direction.

34097 **(SLAC-CN—271) SLC intergirder quad vibrations.** McLagan, K. (Stanford Linear Accelerator Center, CA (USA)). 25 Jun 1984. Contract AC03-76SF00515. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013502.

This report concerns recent measurements of the x, y and z vibrational motion of the quadrupole focusing magnets mounted between 40' girder assemblies in Sector 5. The amplitudes of their vibration were of particular concern, and these were measured in the presence of several different disturbances.

34098 **(SLAC-PUB—3331) Trends in accelerator control systems.** Crowley-Milling, M.C. (Stanford Linear Accelerator Center, CA (USA)). Apr 1984. Contract AC03-76SF00515. 5p. (CONF-840529—38). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012511.

From Linear accelerator conference; Darmstadt-Seeheim, F.R. Germany (7 May 1984).

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Over the years, we have seen a revolution in control systems that has followed the ever decreasing cost of computer power and memory. It started with the data gathering, when people distrusted the computer to perform control actions correctly, through the stage of using a computer to perform control actions correctly, through the stage of using a computer system to provide a convenient remote look and adjust facility, to the present day, when more and more emphasis is being placed on using a computer system to simulate or model all or parts of the accelerator, feed in the required performance and calling for the computers to set the various parameters and then measure the actual performance, with iteration if necessary. The progress that has been made in the fields of architecture, communications, computers, interface, software design and operator interface is reviewed.

34099 **(BNL-tr—1032) New pulser for principal PO power.** Coudert, G. (Brookhaven National Lab., Upton, NY (USA); European Organization for Nuclear Research, Geneva (Switzerland)). 1984. Contract AC02-76CH00016. Translation of PS/PO/Note 82-9, September 1982. 33p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013349.

Portions are illegible in microfiche products.

The pulser of the principal power of the PS is the unit that makes it possible to generate the reference function of the voltage of the principal magnet. This function depends on time and on the magnetic field of the magnet. It also generates various synchronization and reference pulses.

34100 **PHERMEX electron gun development.** Builta, L.A.; Elliott, J.C.; Moir, D.C.; Starke, T.P.; Vecere, C.A. (Los Alamos Nat.'l Lab., Los Alamos, NM 87545). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 2728-2730(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The PHERMEX facility is a 50 MHz standing wave linear accelerator which injects, accelerates, and transports electrons to a tungsten target where Bremsstrahlung x-rays are generated for flash radiography of hydrodynamic systems. The goal of the electron gun program is to generate and transport a 200 ns, 1 MeV, 1 kA beam into the first PHERMEX accelerating cavity. The standard gun is operated at a pulse voltage of 550 keV; this limit is determined by internal breakdown in the vacuum insulator. This insulator has been redesigned and the gun has been pulsed at 750 keV without breakdown. At present, the current output is not limited by voltage but by a phenomenon called pulse shortening, which occurs at a voltage of ca. 650 keV. This paper discusses the results of an investigation into this phenomenon, describes the development program, design, and experimental arrangement of the injector, and presents an array of measured performance data.

34101 **Status of BESSY, an 800-MeV storage ring dedicated to synchrotron radiation.** Egan-Krieger, G.V.; Einfeld, D.; Hoberg, H.G.; Klotz, W.D.; Lehr, H.; Maier, R.; Martin, M.; Mulhaupt, G.; Richter, R.; Schulz, L. (Berliner Elektronenspeicherring-Gesellschaft fur Synchrotronstrahlung m.b.H. (BESSY) 1000 Berlin (West) 33, Lentzeallee 100 CNTRY: DD). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3094-3096(Aug 1983).

BESSY is a national dedicated source for synchrotron radiation situated in West Berlin. This facility includes an 800 MeV electron storage ring, an 800 MeV separated function injector-synchrotron, and a 20 MeV preinjector-microtron. The storage ring is available for three classes of user groups: basic and applied research

performed by universities and research institutions, industrial development in the field of x-ray lithography, and radiometry. The critical wavelength for BESSY was chosen as 2 nm. This corresponds to a maximum field strength of 1.5 T in the bending magnets at 800 MeV and a bending radius of 1.78 m. By this choice of spectral range, which covers the infrared, VUV, and soft x-ray region up to 5 KeV photon energies, BESSY meets the demands of x-ray lithography and complements the hard x-ray laboratory HASYLAB at DESY. The two laboratories serve as national centers for synchrotron radiation research. In order to meet the demands of users in the various fields, a magnet lattice with four fold supersymmetry was chosen, with the flexibility of permitting operation of the storage ring with different magnet optics. The lattice consist of eight quadrupoles and three 30° bending magnets per cell. User operation started in July 1982. Nine monochromators out of a projected sixteen have been commissioned and turned over to user availability. Of the available six beam lines in the lithography laboratory two were commissioned in September 1982 and fitted with exposure chambers. This paper discusses the optics and dynamics of BESSY determined so far on the basis of this operating experience.

34102 **A cusped field H^- ion source for LAMPF.** York, R.L.; Stevens, R.R. Jr. (Los Alamos Nat.'l Lab., Los Alamos, NM 87545). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 2705-2707(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The addition of the Proton Storage Ring (PSR) to LAMPF requires the development of a more intense H^- ion source. The goals of this development program are to produce a beam of sufficient quality to match the acceptance of the accelerator and of sufficient intensity and duty factor to satisfy PSR operation as well as existing LAMPF requirements. The ion source concept best suited to these demands is the multi-cusp negative ion source being developed at LBL. The H^- ion source development was carried out on the high-voltage test stand in the LAMPF injector complex. The test stand, upgraded for the project, provides both unanalyzed and mass-analyzed beams to appropriate emittance scanning stations. Beam currents are measured using both beam current toroids and biased Faraday cups in both sections of the transport line. The emittance data are processed by the SEL 840 control computer at LAMPF. Ion source testing has been carried out using the extraction optics originally developed for the LAMPF duoplasmatron. Optics questions are being addressed by the plasma simulation code SNOW developed at Sandia. The accelerating column design will seek to minimize the divergence of the extracted beam and the predictions from SNOW will be tested on the stand with actual H^- beams.

34103 **Superconducting materials for particle accelerator magnets.** Larbalestier, D.C. (Applied Superconductivity Center, Univ. of Wisconsin, Madison, Wisconsin 53706). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3299-3303(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

Present accelerator designs are clustered around a field of 5 Tesla with several future studies looking at the 8-to-10 Tesla range. There has also been some recent interest in low-field iron-dominated dipoles in which the superconductor will see a field of about 2 Tesla. The demands of this present range of interest can still be met, with the upper limit at about 10 Tesla, by the use of Nb-Ti (or Nb-Ti-Ta) or Nb_3Sn. Both of these conductors are available in multifilamentary form from industrial sources and are suitable for accelerator magnets. The upper critical field and transition temperature of both types of composite cover the foreseeable range of demand for such magnets. There is no magical new composite on the horizon that is likely to replace Nb-Ti or Nb_3Sn. One class of materials which has a potentially exciting prospect is that of the ternary molybdenum sulfides. These can have an upper critical field of greater than 50 T, which extends their superconductivity into field ranges unattainable with A15 compounds; the two drawbacks to such materials, however, are the amount of development needed to produce superconductors from them with useful current densities and the fact that it does not appear that they would offer any features not already possessed by Nb-Ti or Nb_3Sn in the field range presently of interest to accelerator designers. Using this pragmatic approach, this paper addresses these and other superconducting composites in terms of their fabrication, their testing, the measurement aspects of their critical current densities, and other properties which are pertinent to their selection for particle accelerator magnet use.

34104 **The present status of the Daresbury Nuclear Structure Facility.** Voss, R.G.P. (Science and Engineering Research Council, Daresbury Lab., Daresbury, Warrington WA4 4AD). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 2680-2684(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

This paper covers the development of the Daresbury Nuclear Structure Facility from 1973 to the present. At that point, the design study had been completed for a tandem to operate initially at 20 MeV and to undergo eventual upgrading to 30 MeV, and a fully costed proposal had been submitted to the Science Research Council. In 1974, planning permission was obtained, and full financial authorization was given to proceed to the 20 MeV stage. The design of the accelerator fell into two areas. The first of these covered those aspects of the design based on known techniques and calculable properties such as the ion beam optics and dynamics and associated equipment. The second area dealt with the less certain design aspects: the behavior of insulators, their protection, the properties of charging mechanisms, accelerator tubes and vacuum systems, and the operation of a computerized control system in a hostile high-voltage environment. This paper describes the research programs and the pilot and test equipment employed to overcome these uncertainties and goes on to discuss a variety of experiments conducted at the present facility.

34105 **Accelerator development at Bates.** Sargent, C.P. (MIT Bates Linear Accelerator, P.O. Box 846 Middleton, MA 01949-2846). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3262-3266(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The past year has seen the completion of a major expansion of the Bates Accelerator Laboratory. A second experimental hall, South Hall, and several magnetic spectrometers have been constructed. The accelerator's maximum energy has been raised from 400 to 750 MeV by means of beam recirculation. A current two-year project for the fabrication of an additional RF transmitter plus a 30% increase in RF peak power capability will increase energy further to ca. 1 GeV. During the same period pulse-to-pulse beam sharing between the high-resolution spectrometer area and South Hall will become available. In January 1981 the Laboratory submitted their "Proposal for a Long-Range Expansion Program" to DOE-NSF. The proposed development consists of three stages. Stage I calls for the addition of a pulse stretcher ring to furnish a CW beam to the South Hall beam lines. Additional experimental space for internal target experiments and photon tagging research are also included. Stage II increases the accelerator energy to 2.1 GeV (at 140 microamps) by means of a five-pass head-to-tail recirculator. Stage III is, at this time, a plan rather than a proposal. It increases accelerator energy to 4 GeV by extending the accelerator length and power and adds another pulse stretcher ring and three new experimental areas for the higher energy work. This paper discusses each of these stages in detail and recommends their funding and scheduling.

34106 **Superconducting delay line for stochastic cooling filters.** Kuchnir, M.; McCarthy, J.D.; Pasquinelli, R.J. (Fermi Nat.'l Accelerator Lab., P.O. Box 500, Batavia, IL 60510). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3360-3362(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The stochastic cooling system of the antiproton source at Fermilab uses notch filters for reducing the feedback power at fre-

quencies corresponding to particles in the core. At the same time these filters assist in shaping the gain vs. momentum in the stack tail. These filters, therefore, must attenuate all the harmonics of the revolution frequency (629 kHz) in the operating frequency band (1-2 GHz). They require components providing delays of 1.59 microseconds with a minimum of attenuation and undesirable distortion in this passband. Transmission lines providing such delays are typically 328 m long, have a rather large diameter, and are fabricated from a high conductivity material to keep the attenuation sufficiently low. The use of superconductors allows a dramatic reduction in the diameter, total size, and cost of this component in spite of the added cryogenic requirements. The authors measured the performance of two such cables in order to demonstrate the feasibility of the superconducting cable-notch filter concept. The first cable is an 84 m long superconducting coax consisting of a solid Niobium inner conductor inside a teflon dielectric, a lead outer conductor, and an outer jacket of mylar tape. The second cable is a 1.0 km long coaxial line with an inner conductor of lead-plated copper wire, a FEP teflon dielectric, and an outer conductor of leadplated copper tape wrapped with mylar. This paper discusses the results of performance testing of both cables and assesses their compatibilities with notch filters.

4304 Storage Rings

34107 **(FERMILAB-Conf—84/29-THY) Coupled bunch instabilities in a p anti p collider.** Bjorken, J.D. (Fermi National Accelerator Lab., Batavia, IL (USA)). Feb 1984. Contract AC02-76CH03000. 13p. (CONF-840275—9). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012704.

From Workshop on anti pp options for the SSC; Chicago, IL, USA (13 Feb 1984).

These notes summarize a small amount of work done during preparation of the Fermilab Dedicated Collider proposal last year. The basic problem is as follows: Consider a storage ring with k proton bunches and k antiproton bunches, where electrostatic deflection devices are used to separate the beams except at the collision points in the interaction regions. Then the normal betatron motions of the bunches become coupled not only by the usual beam-beam force at collision points, but also by the forces exerted in the close encounters as one bunch passes nearby another. The problem we pose is simply to determine necessary and sufficient conditions for stability, given a linear approximation to the forces and motions as well as an assumption of rigid (coherent) bunch motion. This problem-essentially one of coupled oscillators-has been studied before, and the main result here may be folklore. However, this author has had some trouble, as usual, in identifying it all from the literature. We hope that the formalism and results here may be of use in exploring this phenomenon in more generality.

34108 (INIS-SU—211, pp 3-5) **Reconstruction of the KFTI N-100 storage ring with increase of stored electron energy up to 160 MeV.** Kozin, V.P.; Markov, V.V.; Mocheshnikov, N.I.; Tolstoj, A.E. 1982. (In Russian). NTIS (US Sales Only), PC A04/MF A01. Order Number TI84780255.

Microfiche only, copy does not permit paper copy reproduction. Original copy available until stock is exhausted refs.; 3 figs.; 1 tab.

In Technique of physical experiment.

To increase the effectiveness of investigations into dynamics of injected and accumulated electron beams as well as to broaden the possibilities of applying synchrotron radiation in H-100 storage ring of KFTJ of the Ukranian Academy of Sciences, the energy of electrons has been increased from 100 MeV (according to the project) to 160 MeV. The analysis of experimental curves of magnetized quadrants and exact calculation of the magnetic circuit have shown that by way of increasing magnetic motive force of quadrants it is possible to increase the intensity of magnetic field to the level 1 to 1.1 Tl, which corresponds to the energy of circulating electrons 160 to 165 MeV. In the course of reconstruction the intensification of separate section of magnetic circuit of quadrants is made, the ajustment of the ring that of injection tract is performed, measurements of the main magnetic characteristic are made. The first control experiments on the accumulation of the beam of electrons with the energy of 70 MeV and the following adiabatic increase of energy up to 160 MeV have shown that losses of the circulating beam do not exceed 10%.

34111 **Photon factory: status of storage ring.** *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-30**: No. 4, 3130-3132(Aug 1983). (CONF-830311—).

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

The 2.5 GeV electron storage ring at the Photon Factory is a dedicated synchrotron radiation source. The magnet system, composed of 28 bending magnets and 58 quadrupoles, is capable of raising energy up to 3 GeV by ramping after the beam is stacked. Injection is carried out in the multi-turn scheme at pulse times as long as 1 microsecond, a revolution time of 624 nanoseconds, and a rate of 1 Hz. Four 500 MHz RF cavities are situated in the straight section. Each cell is rated to dissipate 30 kW of RF power from an RF source consisting of two 180 kW klystrons. Out of 24 possible exit ports for synchrotron radiation, seven beam lines are operational and two more are in preparation. Each line is split into three or four branch lines, to each of which an experimental station is attached. The first beam was stored at the design energy in March 1982. Experiments in synchrotron radiation were begun in June. A superconducting vertical wiggler of 5 T and a permanent magnet undulator were successfully brought into operation in February 1983. This paper assesses the design and operating experience of the storage ring over its lifetime.

34112 **(BNL—34839) Recent developments in thermoluminescence kinetics.** Levy, P.W. (Brookhaven National Lab., Upton, NY (USA)). 1984. Contract AC02-76CH00016. 34p. (CONF-840290—1). NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013226.

From National symposium on thermally stimulated luminescence and related phenomena; Ahmedabad, India (1 Feb 1984).

Thermoluminescence (TL) kinetics have been investigated that are more general than those described by the well known 1st and 2nd order kinetic equations. Single glow peak systems studied include the general one-trap kinetic expression from which the 1st and 2nd order kinetics re derived. Glow curves computed from this expression were regarded as data, and their properties determined by inspection and by fitting to the less general 1st and 2nd order kinetics. Often the computed glow curves are well fitted by the 1st and/or 2nd order kinetics over their upper 60 percent, but not in the wings. The best-fit determined kinetic parameters usually differ appreciably from those used to compute the data curves. The properties of the general one-trap kinetics are exemplified by measured glow curves from CaF_2:Mn. To describe systems with two or more

glow peaks, kinetics have been developed that appear to be the simplest possible extension of the general one-trap kinetic expression that describes the retrapping of thermally released charges on all traps present. Called interactive TL kinetics, its properties have also been studied by computing glow curves and determining their properties by inspection and fitting to 1st and 2nd order glow peaks. The interactive kinetic glow curves exhibit all of the properties mentioned above for single peak glow curves and, in addition, reproduce many experimentally determined features that are anomalous and/or not described by the usual 1st and 2nd order kinetics. Also, glow curves computer from the interactive kinetic equations for increasing initial trapped charge concentrations, i.e. increasing premeasurement doses, exhibit supralinearity. Thus the little understood supralinearity appears to be a natural property of TL systems described by intereactive kinetics.

34113 (DOE/ER/40048—89-L3) Photon detectors, E/sub γ/ = several MeV to 1 GeV. Bowman, D.; Snover, K. (Washington Univ., Seattle (USA). Nuclear Physics Lab.). 1984. Contract AC06-81ER40048. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013826.

Portions are illegible in microfiche products.

Our ability to detect photons is crude compared to the efficiency and precision of techniques available for charged particles. This makes each advance in detector technology important; a factor of 2 improvement in resolution, timing or efficiency may make it possible to study a new class of phenomena or to find a new aspect of a familiar phenomenon. We discuss the properties of several types of instruments for the detection of photons of energy between several MeV and 1 GeV. Some of the instruments seem to be fully developed while others, while very interesting, are yet to be demonstrated.

34114 (EML—418) Theoretical and practical implications of the effects of temperature during irradiation and during pre- and post-irradiation storage on the response of thermoluminescence dosimeters. Gail de Planque, E. (USDOE Environmental Measurements Lab., New York). Jan 1984. 165p. NTIS, PC A08/MF A01; 1; GPO Dep. Order Number DE84014120.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Experiments have been conducted to determine the applicability of the Randall-Wilkins theory for describing the behavior of CaF_2:Mn thermoluminescence dosimeters (Harshaw TLD-400 chips). Results were obtained for four different conditions: irradiation followed by storage, irradiation after storage, irradiation both preceded and followed by storage, and continuous simultaneous irradiation and storage. The experiments were performed for storage intervals of approximately 1, 2, 3, 5, 6 and 7 days at five different storage temperatures: -25, +20, +65, +150 and +175°C. The results indicate fading that is described not by the Randall-Wilkins theory but rather as a linear function of the logarithm of the storage time. While the results suggest that the trapping efficiency is independent of temperature, they do demonstrate a small decrease in TL response with storage time prior to irradiation which is independent of temperature and time (>17 hours) and hence probably not dosimetric in origin but perhaps optically related. Glow curve analyses support the concept of a band of traps rather than a single trap. The overall results are compared to other data available in the literature most of which is for room-temperature storage. These data, for storage periods ranging from minutes to one year, can also be described as a linear function of the logarithm of the storage time and are remarkably consistent when uniformly normalized. Although peripheral experiments revealed problems associated with self-irradiation as well as a decline in sensitivity with use, the stability experiment results verify the highly favorable stability properties of CaF_2:Mn for widespread application.

34115 (EML—428) RADEX: an active monitor for continuous measurement of ^{222}Rn flux in soil. Watnick, S.; Latner, N.; Graveson, R.T. (USDOE Environmental Measurements Lab., New York). May 1984. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84014122.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A radon exhalation monitor, RADEX, was developed at the Environmental Measurements Laboratory. RADEX is an active radon monitor that continuously samples radon gas emanating from the soil. A hemispherical accumulator is placed on the soil and radon gas is drawn into the RADEX counter at a low, controlled flow rate. As ^{222}Rn decays, the resulting radon daughters are focused by an electrostatic field, deposited directly onto a semiconductor detector, and counted. RADEX's ability to detect rapid changes in radon exhalation is made possible by analyzing RaA alphas with fast decay times. The pulses produced by the radon daughters are integrated hourly and are recorded. This system can operate unattended for 1 week, at which time a desiccant column must be changed. Thus, RADEX allows one to observe and to record continuously the radon flux from the soil. 8 references, 10 figures, 1 table.

34116 (FRNC-TH—1430) First results obtained from the Cello liquid argon end cap calorimeters. Le Diberder, F. (Paris-7 Univ., 75 (France)). May 1981. 195p. (In French). NTIS (US Sales Only), PC A09/MF A01. Order Number DE84751561.

The Cello liquid argon calorimeter is presented in the first part of this thesis. The cryogenic system has to supply three cryostats filled with liquid argon: one cylindrical cryostat of 25 m^3 volume contains 2x8 separate modules; each of the two symmetric end cap cryostats contains two half cylindrical modules. Each module in the end cap part consists of 42 layers of lead strips interleaved with 43 full plates. The strips are alternatively vertical, horizontal and circular. In front of the lead calorimeter are 4 planes of copper foils glued on epoxy for dE/dx measurement. The electronics, signal processing and data acquisition system are described. In the second part, the performance and analysis of data measured by the end cap calorimeters are reported: study of Bhabha scattering $e^+e^- \rightarrow e^+e^-$; preliminary results obtained in two photon physics $e^+e^- \rightarrow e^+e^-\gamma\gamma \rightarrow e^+e^-X$.

34117 (FRNC-TH—1585) Contribution to the development of a primary standard for high energy neutron beams. Mancaux, M. (Toulouse-3 Univ., 31 (France)). Dec 1983. 1p. (In French). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84751571.

A tissue equivalent calorimeter, made of Shonka A-150 plastic, has been constructed in order to create a primary standard for high energy neutrons and to establish a calibration procedure for ionization chambers used in neutrontherapy. After a detailed description of the calorimeter and the associated measuring system, the preliminary tests are presented, in particular, the evolution of the response as a function of accumulated dose. The measurements of the total absorbed dose (n + γ) by calorimetry in a neutron beam, in order to determine chambers' calibration factors in terms of absorbed dose to A-150 plastic, have been performed at the Neutrontherapy Unit of the Centre Hospitalier Regional d'Orleans. The uncertainty in the determination of the total absorbed dose to the tissu equivalent material using the new procedure is 3% lower than that obtained with the usual procedure, derived from an exposure calibration.

34118 (GKSS—82/E/56) Comparative measurements between a Li-6 glass and a He-3 high-pressure gas scintillator. Priesmeyer, H.G.; Fischer, P.; Harz, U.; Soldner, B. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1983. 16p. (CONF-820942—39). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751430.

From Nuclear data for science and technology international conference; Antwerp, Belgium (6 Sep 1982).

The He-3 high-pressure gas scintillation neutron detector commercially available as LND 800, has been compated to a Li-6 glass scintillator type NE 912. (n,γ) pulse height discrimination capabilities and neutron detection efficiencies have been determined. The objective of these measurements was to try to improve the Kiel Fast-Chopper TOF detector system by using a gasscintillator, which could cover the neutron beam geometry and by which gamma ray background contributions could be reduced. The time response always meets the requirements of a chopper experiment,

but the neutron detection efficiency of the Li-6 glasses now used had to be maintained.

34119 **(HAR—4903) Neutron time-of-flight data acquisition system.** Morris, D.V. (UKAEA Atomic Energy Research Establishment, Harwell. Nuclear Physics Div.). Oct 1983. 48p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84780376.

A neutron time-of-flight scaler system is described for use with the Harwell Linac. The equipment is sufficiently versatile to be used with several types of computers although normally used with DEC PDP 11/45 and PDP 11/34. Using a combination of different input and memory boards most types of experiments can be accommodated. (author).

34120 **(IAEA-R—2549-F) Development of a prototype calorimeter for absorbed dose determination. Final report for the period 1 May 1980 - 31 December 1983.** Duftschmidt, K.E. (International Atomic Energy Agency, Vienna (Austria)). Dec 1983. 27p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84702040.

As the final report of a three-year project carried out in the IAEA dosimetry laboratory on 'Design and construction of a portable graphite calorimeter', the construction, mode of operation, testing and performances of a prototype and four production units are presented. Results of extensive testing, by measuring the absolute absorbed dose with different ^{60}Co sources, at the Seibersdorf Laboratory and the Hungarian National Office of Measures, Budapest, are given. Due to the improvements in the electronic circuitry, the introduction of a second core thermistor, and a new mode of operation under isothermic conditions, the sensitivity of the new apparatus was improved with one order of magnitude compared to the model started from, namely the one developed at the US National Bureau of Standards.

From Nuclear Societies of Israel joint annual meeting; Tel Aviv, Israel (14 Dec 1982).

34131 **(INS-TL—143) New source exchange equipment of the INS iron-free β-ray spectrometer.** Kawakami, H.; Fujita, Y. (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study). Oct 1982. 9p. (In Japanese). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84702041.

The new beta-ray source exchange equipment has been developed for the INS beta-ray spectrometer. A beta-ray souce is confined under vacuum in the special container, and the equipment can exchange a beta-ray source without breaking the vacuum of the source container and the source chamber of the spectrometer. This report describes what it is, and how to exchange a beta-ray source with it.

34132 **(KFK—3596) Control program of the neutron four-circle-diffractometer P32 at the SILOE reactor/CEN Grenoble.** Guth, H.; Paulus, H.; Reimers, W.; Heger, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Angewandte Kernphysik 1). Sep 1983. 100p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE84751480.

The four-circle diffractometer P32 for elastic neutron scattering on single crystals was installed at the SILOE reactor/CEN Grenoble in 1981. The control program, presented here, is a new update of the former program versions used at the FR2 reactor/Kernforschungszentrum Karlsruhe. Important improvements concerning reliability and handling of the diffractometer are added.

34133 **(LAL-RT—83-14) Vertex detector of the UA2 experiment (a low mass self sustaining system of cylindrical multiwire proportional chambers).** Dialinas, M.; Forget, J.; Geoffroy, D.; Jean, P.; Vergand, M. (Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire). Jul 1983. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751565.

Portions are illegible in microfiche products.

The construction of the cylindrical proportional strip chambers of the UA2 vertex detector is reported. The mechanical design, the engineering and the effective realization are described in detail. Possible improvements for the construction of such chambers are also given.

34134 (PB—84-151885) Integral reaction rate measurements in ^{252}Cf and ^{235}U fission spectra. Final report. Lamaze, G.P.; McGarry, E.D.; Schima, F. (National Bureau of Standards, Washington, DC (USA)). 1983. 5p. Pub. in Proceedings of Nucl. Data Sci. Technol., Antwerp, Belgium, September 6-10, 1982.

In support of the light water reactor pressure vessel (LWR-PV) surveillance dosimetry program established by the U.S. Nuclear Regulatory Commission, the National Bureau of Standards is undertaking a series of measurements to provide a physical basis for neutron dosimetry standards. Reaction rate measurements have been made with both 252 Cf and 235U fission neutron fields. The following reactions have been measured through an activation technique: 115In(n,n') 58Ni(n,p) and 54Fe(n,p). The neutron emission rate of the 252Cf source has been measured with the MnSO4 bath technique, thus permitting a direct measure of the spectrum averaged integral cross section for Cf. The source strength of the 235U fission neutron field has been measured relative to the 252Cf neutron field using the 115In(n,n') reaction. All measurement of cross sections in the 235U fission field are therefore relative measurements.

34135 (PNL—5136) TACI: a code for interactive analysis of neutron data produced by a tissue equivalent proportional counter. Cummings, F.M. (Pacific Northwest Lab., Richland, WA (USA)). Jun 1984. Contract AC06-76RL01830. 50p. (UC—32). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013922.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The TEPC analysis code (TACI) is a computer program designed to analyze pulse height data generated by a tissue equivalent proportional counter (TEPC). It is written in HP BASIC and is for use on an HP-87XM personal computer. The theory of TEPC analysis upon which this code is based is summarized.

34136 (PNL-SA—10985) Results of testing and evaluating a health physics instrument performance standard. Kenoyer, J.L.; Swinth, K.L.; Kathren, R.L.; Fleming, D.M.; Selby, J.M.; Vallario, E.J.; Federline, M.V. (Pacific Northwest Lab., Richland, WA (USA); USDOE, Washington, DC; Nuclear Regulatory Commission, Washington, DC (USA)). Sep 1983. Contract AC06-76RL01830. 5p. (CONF-840512—11). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013252.

From 6. congress of the International Radiation Protection Association; Berlin, F.R. Germany (7 May 1984).

This paper presents data taken during testing of health physics instrumentation that provides information for the evaluation of the applicability and practicality of the proposed ANSI standard (N42.17) and the determination of the degree of conformance of currently available instruments to the proposed standard. The instruments tested included ionization chambers, Geiger Mueller detectors, alpha survey meters, neutron dose equivalent survey meters, and air monitors. (ACR)

34137 (Y/DD—336) Design and use of a constant geometry system to measure activated indium foil in personnel security badges. Barclay, R.K. (Oak Ridge Y-12 Plant, TN (USA)). Jun 1984. Contract AC05-84OS21400. 19p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013640.

A device for measuring the exposure rate from neutron-activated indium foil, under constant geometry, has been designed, constructed, and tested. The device is intended for use with the Juno ionization chambers, although it adapts to Victoreen CDV-700 and Victoreen 193 G-M instruments. Juno dose-response data for low (53 rad) and high (226 rad) doses were compiled and modeled. This model was compared to that assumed from the indium foil dose-response model in current use; plots of fitted and assumed models are congruent. An analysis of data from both Juno and CDV-700 instruments indicates that the constant geometry device may be used effectively to monitor the decay of In-116m. Tolerance limits for the Juno dose-response curve increase with time after activation, which results in diminished precision of dose estimates made by indium foil measurement. From the data collected in these experiments, the system appears to be most useful if activation is measured within 250 min after exposure. 5 references, 7 figures, 1 table.

34138 Neutron and gamma personnel dosemeter response in mixed radiation fields. Swaja, R.E.; Greene, R.T. (Oak Ridge National Lab., TN (USA)). *Radiation Protection Dosimetry;* **5**: No. 2, 101-108(1983).

Experiments were conducted to determine performance characteristics of neutron and gamma personnel dosimetry systems in mixed radiation fields produced using the Health Physics Research Reactor. The experiments consisted of measuring dose equivalents in known radiation fields, and determining personnel dosemeter responses to criticality accident conditions. Measured results are summarised and analysed for all three experiments.

34139 Low-background high-efficiency detector for the study of the (n,α) reaction at pulsed neutron source. Antonov, A.; Bogdzel, A.; Gledenov, Y.M.; Tishin, V.G. (Joint Institute for Nuclear Research, Laboratory of Neutron Physics H.P.O. Box 79, Moscow). *Nuclear Technology;* **59**: No. 3, 526-531(Dec 1982).

The reported alpha-particle detector consists of eight flat proportional chambers connected in pairs. It is designed for measurement of the (n,α) reaction on resonance neutrons from a pulsed neutron source with a pulse duration of about 50 ns. The target's total area is 10,000 cm^2, which allows the use of large amounts of investigated materials (up to 100 g). The detector is used as a low-background counter of alpha particles. Its background is $<3 \times 10^{-4}$ count/$cm^2 \times s$ at a neutron flux of $>10^6$ n/$cm^2 \times s$. For an integral neutron flux of about 10^{12} n/cm^2, stable operation of the detector was obtained.

34140 Source imaging using neutron pinhole cameras based on position-sensitive proportional counters. Johnson, R.G.; Behrens, J.W.; Bowman, C.D. (National Bureau of Standards, Washington, DC 20234). *Nuclear Technology;* **55**: No. 3, 724-727(Dec 1981).

A pinhole camera technique has been used to measure the variation in neutron emission intensity over the area of the neutron-producing target of the National Bureau of Standards Electron Linac. The method uses a one-dimensional position-sensitive proportional counter (PSPC) with an intrinsic spatial resolution of 1.0 mm. The pinhole is made in a thick sheet of cadmium and neutron energy (<0.3-eV) selection is achieved by time-of-flight. In a completely separate experiment, the neutron cone obtained from the (d,t) reaction using the associated-particle technique was imaged by a two-dimensional PSPC. This second measurement demonstrated the use of the two-dimensional detector for imaging high-energy (14-MeV) neutrons.

4402 Radiation Effects On Instrument Components, Instruments, Or Electronic Systems

34141 (AD-A—139930/2) Low power radiation hard GaAs RAM. Semi-annual technical report 10 Jun 82-9 Dec 83. Kirkpatrick, C.G.; Vahrenkamp, R.P. (Rockwell International Corp., Thousand Oaks, CA (USA). Microelectronics Research and Development Center). Mar 1984. 35p. NTIS, PC A03/MF A01.

The scope of this program is to demonstrate a 1K GaAs static RAM having very low power dissipation, 1 micro W/bit in standby, and a short access time, 10 ns, to meet the requirements of the DARPA Advanced On-Board Signal Processor (AOSP). In the six month period covered by this report the initial processing of the 1K RAM arrays was begun. Testing of several lots revealed a mask error which is currently being corrected. The isolation studies for ultra-low power devices continued with major emphasis on isolation degradation following the Schottky metal process. A theoretical formulation for the leakage behavior of GaAs substrates was initiated, and good agreement between theory and the experimental data was obtained. Upset measurements have been made on a number of 256 bit RAMs using an Am-241 alpha particle source. The numerical value for the failure cross section was found to be similar in magnitude to the area of the Schottky barrier speed-up

capacitor, suggesting that the capacitor is primarily responsible for the magnitude of the upset cross section. Single event upset measurements have also been carried out using 40 meV/protons at the NRL cyclotron facility. The results for this case also demonstrated a lower upset cross section for RAMs fabricated without the n(-) layer in the speed-up capacitor. A conceptual design of a new RAM mask set was begun in order to evaluate a wider range of RAM cell configurations. Both 256 and 1K bit arrays are being considered, and emphasis will be placed both on cell designs for enhanced yield and radiation hardness. Enhancement/depletion devices will also be incorporated into the design.

34142 **(HMI-B—380) GfW-handbook for irradiation test guidelines for radiation hardness of electronic components.** Braeunig, D.; Wulf, F.; Gaebler, W.; Boden, A. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.). Bereich Datenverarbeitung und Elektronik; Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.). Bereich fuer Projekttraegerschaften). Dec 1982. 239p. Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.). Bereich Datenverarbeitung und Elektronik.

The purpose of the report is to propose irradiation test methods so that a standardized application of the methods can lead to a better comparison of test results. The interaction of different radiation species with matter - ionization and displacement - is described. Application of appropriate radiation sources, dosimetry problems, and shielding for simulating space radiation effects by laboratory testing is discussed. The description and characteristics of the irradiation sources are presented. Flowcharts of the planning and running of irradiation tests are given. Guidelines for running the tests are established, test methods and test circuits are proposed. The test system offers the capability of measuring devices also of high complexity up to microprocessors. The test results are collected regularly and are published in GfW-Handbook TN53/08, 'Data Compilation of Irradiation Tested Electronic Components'.

34143 **(UCRL—15596) Response of multilayer films and mirrors to intense x-irradiation.** Watson, B.A.; Kohler, D.A.; Guttman, J.L. (Lockheed Palo Alto Research Labs., CA (USA). Applied Physics Lab.). 1984. Contract W-7405-ENG-48. 34p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013221.

Portions are illegible in microfiche products.

Fluence levels at which component degradation occurs have been determined and the nature of the change in reflectivity resulting from x-ray induced damage has been characterized. For the case of the nickel mirror, damage occurred at x-ray fluence levels of 150 mJ/cm. Result of the damage was a decrease in reflectivity. For the case of the multilayer thin film structure, damage was observed at x-ray fluence levels of 500 mJ/cm, and the damage appeared as a broadening of the line width of the Bragg reflected x-rays and as a decrease in the reflection efficiency.

34144 **(CONF-8405183—2) Selective monitoring of hazardous chemicals in emergency situations.** Stetter, J.R.; Zaromb, S.; Penrose, W.R.; Otagawa, T.; Sincali, A.J.; Stull, J.O. (Argonne National Lab., IL (USA); Coast Guard, Washington, DC (USA)). 1984. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013436.

From Joint Army Navy Nasa Air Force S and EPS annual meeting; Las Cruces, NM, USA (7 May 1984).

Portions are illegible in microfiche products.

A recently reported portable instrument for detecting, identifying, and monitoring chemical hazards, developed for alerting U.S. Coast Guard personnel to the presence of hazardous vapors, can monitor all or most of the approximately 30 compounds frequently encountered in JANNAF missions. The instrument uses an array of four different amperometric sensors operating in conjunction with two different noble-metal filaments that may be heated to either 900 or 1000°C. Operation of the sensor-filament array in four differently selective modes generates 16-parameter response patterns, each of which is characteristic of an individual compound. Histograms and response-versus-concentration plots presented for 17 compounds of interest to JANNAF members show that each compound is distinguishable from the others through its response pattern and that the sensor responses are proportional to the concentration of each compound in the usually encountered ranges (0-50 ppM or, for some compounds, 0-200 ppM). For the subject array, the estimated lower limit of detection ranges from about 0.1 ppM (for acetone, hydrogen sulfide, nitromethane, hydrazine, or chlorine) to 12 ppM (for nitrobenzene).

34145 **(DOE/ER/10845—T1) Surface-plasmon exploration of multilayer physisorbed and chemisorbed films on metal substrates.** Bretz, M. (Michigan Univ., Ann Arbor (USA)). 31 Mar 1984. Contract AC02-81ER10845. 7p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84014218.

Over the course of this 3 year DOE contract we have built up a high quality Surface Plasmon Resonance apparatus, surveyed Xe, O_2 and CO multilayer adsorption of silver, made several appropriate experimental modifications and then obtained data on low pressure bulk formation of Xenon multilayers. A publication of current Xe results is now in preparation.

34146 (INIS-BR—119, pp 164) **Thermocouple fixing device.** Nagy, G.P.; Pereira, V.Q. (Instituto de Engenharia Nuclear, Rio de Janeiro (Brazil)). 1981. (In Portuguese). NTIS (US Sales Only), PC A08/MF A01. Order Number TI84780333.

In Annual Progress Report of 1981.

34147 (INIS-BR—119, pp 167) **Thermocouples fixing with small thickness steel plate.** Pereira, V.Q. (Instituto de Engenharia Nuclear, Rio de Janeiro (Brazil)). 1981. (In Portuguese). NTIS (US Sales Only), PC A08/MF A01. Order Number TI84780333.

In Annual Progress Report of 1981.

34148 (INIS-BR—120, pp 92) **Digital fluorimeter.** Mello, H.A. de (Instituto de Engenharia Nuclear, Rio de Janeiro (Brazil)). 1983. (In Portuguese). NTIS (US Sales Only), PC A11/MF A01. Order Number TI84780396.

In Annual Progress Report of 1982.

34149 **(INIS-mf—8357) Method to process high signal rates in pulse analysis, illustrated by the example of X-ray spectroscopy.** Tadros, Y. (Bochum Univ. (Germany, F.R.). Abt. fuer Elektrotechnik). 27 Nov 1980. 120p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84780315.

In X-ray fluorescence spectroscopy, good resolution of amplitudes at high pulse rates is required. Three filters are presented by which, with appropriate compensation, the distortion due to the pile-up effect is avoided, the signal/noise rate is improved, and the processing rate is increased. A pile-up processor with RC1-filter is realised. (orig.).

34150 (INIS-mf—8365, pp 61-64) **Accelerator mass spectroscopy with completely stripped ^{36}Cl.** Ernst, H.; Korschinek, G.; Kubik, P.; Morinaga, H.; Nolte, E.; Ratzinger, U.; Teichmann, S.; Wild, E. 1983. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number TI84780230.

In Annual report 1982 of the Beschleunigerlaboratorium of Univ. and Technische Univ. Muenchen.

The AMS method by means of completely stripped ^{36}Cl presented in the AR 1981 was further improved. The detection limit (1 ^{36}Cl event per hour measuring time) could be lowered by a factor about 100 to $^{36}Cl/Cl = 4 \times 10^{-15}$. (orig.).

34151 (INIS-mf—8901, pp 111-114) **Studies of particle emission from solid surfaces by means of direct-Reading Detectors.** Berger, S.; Besocke, K.; Hofer, W.O. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Grenzflaechenforschung und Vakuumphysik). 1983. NTIS (US Sales Only), PC A14/MF A01. Order Number TI84701920. (CONF-830120—Exc.).

From Symposium on surface science; Obertraun, Austria (30 Jan 1983).

An experimental set-up measuring differential sputtering yields and angular distribution of sputtered and/or evaporated particles is described. By beam switching the evaporation and sputtering components can be separated which is a problem at higher sample temperatures. As a specific application the temperature dependence of the differential sputtering yield of silver under atomic and molecular antimony bombardment is investigated. It is concluded that direct reading particle detectors can give valuable information in special areas. (G.Q.).

34152 (ORNL/TM—9112) **Invention of a tunable damper for use with an acoustic waveguide in hostile environments.** Rogers, S.C. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 38p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013109.

A damper was invented to remove undesirable stress pulses from an acoustic waveguide. Designed to be tunable, the damper was constructed to withstand a corrosive or otherwise hostile environment. It serves to simplify the design and enhance the performance of a water-level measurement system, of which the damper and acoustic waveguide are integral parts. An experimental damper was constructed and applied to an existing level probe and measurement system. The resulting damper, properly tuned, causes acoustic stress pulses that pass into it along the waveguide to be attenuated.

34153 (PB—84-160993) **On-site calibration of flow metering systems installed in buildings. Building science series.** Baker, D.W.; Hurley, C.W. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Jan 1984. 157p. (NBS-BSS—159). NTIS, PC A08/MF A01.

Library of Congress catalog card No. 83-600626. Sponsored in part by Civil Engineering Lab. (Navy), Port Hueneme, CA.

This report summarizes the various types of flowmetering devices used in energy management and control systems (EMCS), various methods for their initial calibration and, when practical, techniques for maintaining their calibration while they are in service. Emphasis is placed on the use of transfer reference meter systems, where the working meter is calibrated on site by connecting it in series with a calibrated transfer meter of any variety. Other methods of calibration are also described. Reference tables and the necessary equations for flow calculations are presented throughout the text and in the appendicies. Illustrative examples are given in detail for the calculation of flow using each type of metering device described.

34154 (SAND—84-0248C) **Rectangular heat source on a semi-infinite solid: an analysis of a thin film heat flux gage.** Keltner, N.R.; Beck, J.V.; Bainbridge, B.L. (Sandia National Labs., Albuquerque, NM (USA); Michigan State Univ., East Lansing (USA). Dept. of Mechanical Engineering). May 1984. Contract AC04-76DP00789. 22p. (CONF-840816—12). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012234.

From 22. national heat transfer conference; Niagara Falls, NY, USA (5 Aug 1984).

Portions are illegible in microfiche products.

A thin film flux gage has been developed for a series of combustion experiments. The gage was designed to provide both rapid response and long use time. Initial calibrations using standard techniques indicated large differences between the literature and the estimated properties. In order to calibrate this gage without resorting the destructive property measurements, an analytical model of the gage response to a step heating current was developed. The model is in the form of three algebraic expressions which correspond to the early, middle, and late time regimes. The expressions are used to provide a framework for least squares estimates of the gage parameters. There is very good agreement between the model and the experimental data. The estimated parameter values demonstrate good to excellent repeatability and good agreement with both new literature data dnd results from destructive property measurements.

34155 (UCID—20093) **d/dt[B^2] detector: method of operation.** Cusson, R.Y.; Strayer, M.R.; Meldner, H.W. (Lawrence Livermore National Lab., CA (USA)). 30 May 1984. Contract W-7405-ENG-48. 9p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013108.

The theory of operation for the ferrite-biased d/dt[$B^2(t)$] = B^2 - dot = d/dt{B^2], detector is outlined. The sensitivities of the calibration constant to the power level in the waveguide, the propagation mode, the temperature and the ferrite magnetization characteristics, are discussed. The differential version, coupled to a BALUN, is discussed.

34156 (UCRL—53522) **Development and capabilities of the LLNL Focused-Beam Reflection-Mode Acoustic Microscope.** Weglein, R.D. (Lawrence Livermore National Lab., CA (USA)). 25 May 1984. Contract W-7405-ENG-48. 64p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013575.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The development and preliminary evaluation of the Focused-Beam Reflection-Mode Acoustic Microscope [abbreviated Focused Reflection Acoustic Microscope (FRAM)] is described. This new facility represents a unique nondestructive evaluation (NDE) resource at LLNL. The report is organized along five major topics. The present and anticipated uses of the FRAM are first described. This is followed by a detailed, largely qualitative narrative of the instrumentation, with particular emphasis on the low-frequency lens design and extended diagnostic metrology capability. Key examples of imaging and metrological case histories are then described. A special case of complementary imaging and metrology - a preliminary diagnosis of spot-welds to silicon solar cells - is detailed more fully. Finally, two types of future efforts are proposed, instrument development that will widen the range of the FRAM uses and analytical development that will enhance quantitative NDE and lead to higher confidence in the decision-making capability.

34157 **Frequency spectrum analyzer with phase-lock.** Boland, T.J. (to Dept. of Energy). US Patent 4,430,611. 7 Feb 1984. Filed date 29 Jul 1981. vp.

PAT-APPL-288234.

A frequency-spectrum analyzer with phase-lock for analyzing the frequency and amplitude of an input signal is comprised of a voltage controlled oscillator (VCO) which is driven by a ramp generator, and a phase error detector circuit. The phase error detector circuit measures the difference in phase between the VCO and the input signal, and drives the VCO locking it in phase momentarily with the input signal. The input signal and the output of the VCO are fed into a correlator which transfers the input signal to a frequency domain, while providing an accurate absolute amplitude measurement of each frequency component of the input signal.

4404 Well Logging Instrumentation

34158 (UCRL—53509) **Development of a multidetector deflection measurement system. Final report, September 1982-August 1983.** Bissinger, H.D.; Robinson, W.L. (Lawrence Livermore National Lab., CA (USA)). 10 Apr 1984. Contract W-7405-ENG-48. 73p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE84013580.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This portion of the final report on the LABAN Laser Optical Line of Sight (LOLOS) project presents the technical portion of the development, including the final design, key calculations, an error budget analysis, environmental test results, and a summary noting critical technical issues.

34159 (BMVg-FBWT—83-7) Determination of phlegmatizer concentration profiles in nitrocellose propellant grains by means of radioisotope tracer technique. Meier, H.; Boesche, D.; Zeitler, G.; Zimmerhackl, E.; Hecker, W. (Bundesministerium der Verteidigung, Bonn (Germany, F.R.); Staatliches Forschungsinstitut fuer Geochemie, Bamberg (Germany, F.R.)). Jul 1983. 102p. (In German). Bundesministerium der Verteidigung, Bonn (Germany, F.R.). Dokumentationszentrum der Bundeswehr.

In continuation of studies with phthalate phlegmatizers labelled with carbon-14 the penetration behaviour of camphor and ethyl centralite into nitrocellulose propellant grains has been measured by applying the radiotracer technique. The tracer methods used for these measurements are based on the profile sectioning techniques in conjunction with liquid scintillation counting and autoradiography. Phlegmatizers have been labelled in this work with tritium. The measurements yield the values for diffusion coefficients, activation energies and frequency factors. In addition concentration profiles have been derived showing a continuous concentration decrease from the surface into the interior of the grain. Moreover, it could be shown that the trend of phlegmatizers to migrate in nitrocellulose propellant powders increases in the order ethyl centralite < di-n-butyl phthalate < camphor. Furthermore, a leveling of the concentration of phlegmatizers during storage at ambient temperature has been observed autoradiographically in camphor/propellant systems. By labelling different phlegmatizers with carbon-14 and tritium, respectively, the diffusion of a mixture of deterrents into propellants can be studied. Measurements with a mixture of C-14-di-n-butyl phthalate and T-ethyl centralite in ethanolic solution point, among others, to a leveling of both diffusion coefficients at higher values and an increase of the penetration depth contrary to the behaviour of the individual deterrents.

34160 (MLM—3157) Electrochemical properties of CP, HMX, RDX, and PETN. Wang, P.S.; Keil, R.G. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 18 Jun 1984. Contract AC04-76DP00053. 15p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013675.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The reduction of the ordnance compounds CP, HMX, PETN, and RDX proceeds irreversibly at a mercury electrode in neutral aqueous buffer solutions. CP undergoes electrochemical reduction with the greatest ease, followed closely by PETN, RDX, and HMX. The electrochemical study was complicated by the strong adsorption of HMX upon mercury. The reduction of RDX was found to be most complex, exhibiting some five well-defined cyclic voltammogram peaks. A thorough study of the electrode kinetics of any one of these compounds will necessitate the use of aprotic solvent systems. A detailed kinetic study of PETN in aqueous solutions is precluded by its limited solubility. In general, after the first wave, the reduction processes were found to be pH dependent.

34161 (SAND—84-0143C) CP DDT detonators. III. Powder column effects. Lieberman, M.L.; Begeal, D.R.; Durand, N.A.; Fleming, W. (Sandia National Labs., Albuquerque, NM (USA); Unidynamics/Phoenix, Inc., AZ (USA)). 1984. Contract AC04-76DP00789. 22p. (CONF-840867—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84012238.

From 9. international protechnics seminar; Colorado Springs, CO, USA (6 Aug 1984).

Portions are illegible in microfiche products.

In this investigation, we have examined the effects of powder column parameters on transition to detonation behavior in CP detonators. Increasing powder loading pressure increases bulk powder density, decreases void volume, and leads toward inhibition of DDT. The extent of inhibition, however, is affected by initial particle size, not simply bulk powder density. This implies that inhibition does not simply correlate with void volume. It has been shown that individual CP crystals undergo considerable diminution during loading. Virtually all porosity remains open; however, as loading pressure increases, the largest pores are eliminated. Transition to detonation in such detonators appears to correlate with gas permeability of the column and the existence of pores greater than approx. 0.2 μm. The results imply that CP DDT is controlled by gas flow through a small percentage of the total pores present and a small percentage of the total pore volume.

34162 (SAND—84-0459C) Effect of oxide coated thickness on thermal ignition of titanium-based pyrotechnics. Erickson, K.L. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 20p. (CONF-840867—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013061.

From 9. international protechnics seminar; Colorado Springs, CO, USA (6 Aug 1984).

The effect which variations in oxide coating thickness can have on thermal ignition of titanium-based pyrotechnics was examined theoretically. The analyses were developed using previously published experimental studies of ignition mechanisms. Those studies indicated that ignition is controlled by the rate at which an already existing oxide coating dissolves in the bulk metal. The specific case of hot-wire ignition at near minimum energy was considered. It was assumed that oxide dissolution occurs by molecular diffusion, and an approximate ignition model was developed to examine the relative variations in ignition times which result from variations in oxide coating thickness. The model consists of a heat conduction equation for the wire and pyrotechnic and a Fick's-law diffusion equation, with Arrhenius-type diffusion coefficient, for the oxygen in the titanium particles. Calculations showed that the ratio of ignition times t/sub i_2//t/sub i_1/ could be estimated from t/sub i_2/t/sub i_1/ ≃ (h_2/h_1)/sup y/, where $y = 2/(1 + Q/6$ kcal $mole^{-1})$; h_2/h_1 is the respective ratio of oxide coating thicknesses, and Q is the oxygen-diffusion activation energy. Literature values for Q vary from 16 to 75 kcal/mole, while the exponent y varies from 0.6 to 0.2, respectively. At lower activation energies, moderate variations in oxide coating thickness could cause significant variations in ignition time.

34163 (UCRL—90318) Influence of diluents and inhibitors on detonations. Moen, I.O.; Ward, S.A.; Thibault, P.A.; Lee, J.H.; Knystautas, R.; Dean, T.; Westbrook, C.K. (Lawrence Livermore National Lab., CA (USA); Defence Research Establishment Suffield, Ralston, Alberta (Canada); Victoria Univ., British Columbia (Canada); McGill Univ., Montreal, Quebec (Canada)). 27 Jan 1984. Contract W-7405-ENG-48. 26p. (CONF-840801—2). NTIS, PC A03/MF A01; GPO Dep. Order Number DE84006300.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

The present paper reports on a series of experiments performed to determine the influence of chemical inhibitors and diluents on the detonability of fuel-air and fuel-oxygen mixtures. The influence of adding small amounts (1 to 3%) of CF_3Br, CF_4 and CO_2 to ethylene-air mixtures was determined by performing large scale critical tube diameter tests. The results of these tests show that the inhibition effect of CF_3Br on detonations is not nearly as dramatic as it is on flames. For detonations, the relatively chemically inert diluent CO_2 is found to be a better inhibitor than CF_3Br. Similar laboratory test with ethylene-oxygen and hydrogen-oxygen mixtures confirm the results obtained for fuel-air mixtures. In fact, the addition of small amounts of CF_3Br to these fuel-oxygen mixtures has a small sensitizing effect, whereas the influence of CO_2 is similar to that observed for fuel-air mixtures. The results are compared with the prediction of a detailed chemical kinetic model for the oxidation and inhibition processes. For CF_3Br, it is found that a chemical kinetic scheme derived from flame data predicts a detonation inhibiting effect much larger than that observed. Possible modifications of this scheme to obtain a consistent description of CF_3Br inhibition are proposed and discussed.

34164 **(UCRL—90322) Measurement of shock induced reaction in rocket propellants by nanosecond infrared radiometry and photography.** von Holle, W.; Kury, J.; James, E.; Scribner, K. (Lawrence Livermore National Lab., CA (USA)). 4 Jun 1984. Contract W-7405-ENG-48. 10p. (CONF-8406136—2). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013209.

From JANNAF propulsion systems hazards meeting; Aberdeen, MD, USA (18 Jun 1984).

Portions are illegible in microfiche products.

The technique of two-color infrared radiometry with 5 ns resolution was established as a useful tool in the investigation of shock-induced heating and reaction in high explosives, both in the detonation and build up phase, as well as inert pressed powders and propellants. These experiments all seem to form a consistent picture of hot spot formation and growth or cooling. The work on propellants has just begun; however, the results appear promising. Thus far the conclusions are consistent with the earlier findings concerning the high degree of involvement of the energetic binder. This may be modified by the increased evidence for initial concerted reactions of the binder and the solid interface to form hot spots, whose nature is sensitive to the solid components present.

4502 Nuclear

34165 **(AD-A—137174/9) Nuclear weapon accident exercise (NUWAX 83) after action report. Volume 2.** (Defense Nuclear Agency, Kirtland AFB, NM (USA)). 30 Dec 1983. 232p. NTIS, PC A11/MF A01.

See also Volume 1, AD-A136977.

Progress in improvement to the national capability to respond to a nuclear weapon accident has been extensive over the past four years. NUWAX-83 provided a number of important lessons. There appear to be several specific areas which offer the greatest opportunity to further enhance our response capability. These include: (A) Radiological guidelines--The absence of coordinated radiological procedures which would rapidly identify and quantify the radiological problem remains an area of weakness. Some examples are: The need to avoid undue public alarm during all phases of accident response, to assure contaminated civilians that they have been properly decontaminated, and to achieve agreement with state and local agencies that buildings, land. etc., have been cleaned up to a level of safety that has broad support among the scientific community. In the absence of some agreed criteria, the economic impact and legal aspects could be overwhelming. (B) Federal, state, and local planning; and (C) Expansion of training opportunities.

34166 **(AD-A—137386/9) Strategic target planning: bridging the gap between theory and practice.** Walker, R.L. (National Defense Univ., Washington, DC (USA). Research Directorate). 1983. 52p. NTIS, PC A04/MF A01.

In seeking a more flexible nuclear strategy, national policymakers may not be taking into account technical limitations to strategic target planning. This doubt is the driving concern behind this study. The author suggests that, because of recent changes in our nuclear strategy, the nuclear arsenal and the enemy target system, a gap may have developed between strategic targeting theory and practice. After tracing the evolution of nuclear targeting, he turns to ways of dealing with the technical constraints faced by target planners. His foremost concern is that strategic targeting concepts do not exceed our technical ability to implement. He proposes improvements in our strategic forces' command, control, and communications facilities to better ensure rapid retargeting . He also argues for more reliable and detailed target intelligence and recommends that a special coordination committee be created to oversee new targeting initiatives.

34167 **(AD-A—138988/1) Soviet theater nuclear capabilities: the European nuclear balance in transition.** Kennedy, R. (Army War Coll., Carlisle Barracks, PA (USA). Strategic Studies Inst.). 31 Aug 1983. 41p. NTIS, PC A03/MF A01.

This memorandum examined the changing strategic and theater nuclear environment; Soviet theater nuclear force improvements and doctrine; the implications of Soviet theater nuclear buildup for deterrence and the defense of Europe; and NATO's response. The author concludes that the changing balance of theater capabilities has resulted in a devaluation of deterrence, a decline in Western self-confidence, and an increase in NATO's vulnerabilities. The author also contends that if the Soviet Union is unwilling to negotiate a significant reduction intermediate-range nuclear forces that now pose a serious threat to the West, the NATO deployment of Pershing II and cruise missiles will not only help to restore balance to the NATO/Warsaw Pact nuclear equation, but will also enhance deterrence, reduce NATO's vulnerabilities, and thus, will contribute to crisis stability in Europe.

34168 **(AD-A—139015/2) Neutron leakage from 'COMET' - a duplicate Little-Boy device. Report for Sep-Oct 82.** Robitaille, H.A.; Hoffarth, B.E. (Defence Research Establishment, Ottawa, Ontario (Canada)). Dec 1983. 45p. (DREO—878). NTIS, PC A03/MF A01.

Abstract in French.

Fast neutron spectra between 600 keV and 10 MeV, directed outwards from the surface of the 'COMET' assembly, were measured using an NE-213 fast-neutron spectrometer at the Los Alamos National Laboratory. The COMET experiment, consisting of a duplicate Little-Boy device suitably modified for operation in the delayed-critical regime, was to provide improved energy and angular distributions of leakage spectra in support of efforts to re-evaluate ground doses from the Hiroshima bombing. Measurements were obtained at seven polar angles (from 0 to 135 degrees) and at two radii from the centre of the active volume (75 and 200 centimeters). These measurements were compared to two calculations available at the time of writing; one an earlier (1976) one-dimensional estimation and another more recent (1982) two-dimensional calculation, both based on Monte-Carlo techniques. Differences in high energy neutron leakage are apparent and probably due to dynamical considerations, as the theoretical calculations simulated the disassembling weapon itself, rather than the static experiments described herein.

34169 **(DOE/NV/10327—10) Operation Phalanx onsite radiological safety report, October 1982-September 1983.** Mullen, O.W.; Eubank, B.F. (Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA)). Jun 1984. Contract AC08-84NV10327. 102p. NTIS, PC A06/MF A01; GPO Dep. Order Number DE84013139.

Phalanx was the name assigned to the series of underground nuclear experiments conducted at the Nevada Test Site from October 1, 1982 through September 30, 1983. Remote radiation measurements were taken during and after each nuclear experiment by a telemetry system. Monitors with portable radiation detection instruments surveyed reentry routes into ground zeros before other planned entries were made. Continuous surveillance was provided while personnel were in radiation areas and appropriate precautions were taken to protect persons from unnecessary exposure to radiation and toxic gases. Protective clothing and equipment were issued as needed. Complete radiological safety and industrial hygiene coverage was provided during drilling and mineback operations. Telemetered and portable radiation detector measurements are listed. Detection instrumentation used is described and specific operational procedures are defined.

34170 **(OEVS-Mitteilung—1/83, pp 7-24) Possible kinds of nuclear weapons.** Tschirf, E. (Atominstitut der Oesterreichischen Universitaeten, Vienna). 1983. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780298. (CONF-8206244—).

From Annual meeting of the Austrian Association for Radiation Protection on protection of the population against radiation of nuclear weapons; Vienna, Austria (29 Jun 1982).

The physical principles of the A, the H and the neutron bomb and their radiation effects - including the electromagnetic pulse - are outlined. (G.Q.).

34171 (OEVS-Mitteilung—1/83, pp 25-38) **Prompt- and long-term radiation in atomic weapon explosions.** Kamelander, G. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H. Inst. fuer Reaktorsicherheit). 1983. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number TI84780298. (CONF-8206244—).

From Annual meeting of the Austrian Association for Radiation Protection on protection of the population against radiation of nuclear weapons; Vienna, Austria (29 Jun 1982).

Generation and properties of prompt and long term radiation caused by atomic weapon explosions are explained. (A.N.).

34172 **(SAND—84-1199C) Lower confidence bounds on system reliability using component data: Maximus methodology.** Spencer, F.W.; Easterling, R.G. (Sandia National Labs., Albuquerque, NM (USA)). 1984. Contract AC04-76DP00789. 24p. (CONF-8406135—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84012813.

From International conference on reliability and quality control; Columbia, MO, USA (4 Jun 1984).

A method of calculating approximate lower confidence bounds on system reliability, based upon binomial component data, is presented. The method is based on a system reduction algorithm by which the component data are reduced to effective binomial system data. The reduction rules treat series-parallel arrangements of components and also the use of the same data to estimate failure probabilities for different components. The confidence limits obtained are conservative for confidence levels of interest. We also discuss extensions to failure-rate estimation. This method was developed by an Ad Hoc Methodology Working Group on Nuclear Weapons Reliability Assessment, which was established by the Departments of Defense and Energy.

34173 **(SSS-R—84-6629) Calculations to assist in a new Hiroshima yield estimate. Final report, August 19-December 31, 1983.** Kennedy, L.W.; Roth, L.A.; Needham, C.E. (S-Cubed, Albuquerque, NM (USA)). 15 Jun 1984. Contract AC03-83ER60148. 86p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013062.

Portions are illegible in microfiche products.

This report describes calculations and analysis performed in an attempt to provide a new estimate for the yield of the Hiroshima weapon. Newly discovered meteorological data was adapted for use in one- and two-dimensional hydrodynamic codes, and a series of calculations was then run for different values of yield. The objective was to determine what yield produced an overpressure record which could best be correlated with an actual trace measured at a parachute-dropped canister. Altitude of the bomb and canister-carrying aircraft at drop time was also a variable parameter. The analysis provides an estimate of 16.6 + 0.3 kt for the yield of the Hiroshima weapon. A drop altitude of near 35,500 feet is shown to be consistent with the signal time-of-arrival. This yield value is within the range of other estimates, but the drop altitude is higher than that previously assumed to be reasonable.

34174 **(UCRL—90095) Neutron and gamma dose and spectra measurements on the Little Boy replica.** Hoots, S.; Wadsworth, D. (Lawrence Livermore National Lab., CA (USA)). 1 Jun 1984. Contract W-7405-ENG-48. 37p. (CONF-840627—4). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013336.

From 29. annual meeting of the Health Physics Society; New Orleans, LA, USA (3 Jun 1984).

Portions are illegible in microfiche products.

The radiation-measurement team of the Weapons Engineering Division at Lawrence Livermore National Laboratory (LLNL) measured neutron and gamma dose and spectra on the Little Boy replica at Los Alamos National Laboratory (LANL) in April 1983. This assembly is a replica of the gun-type atomic bomb exploded over Hiroshima in 1945. These measurements support the National Academy of Sciences Program to reassess the radiation doses due to atomic bomb explosions in Japan. Specifically, the following types of information were important: neutron spectra as a function of geometry, gamma to neutron dose ratios out to 1.5 km, and neutron attenuation in the atmosphere. We measured neutron and gamma dose/fission from close-in to a kilometer out, and neutron and gamma spectra at 90 and 30° close-in. This paper describes these measurements and the results. 12 references, 13 figures, 5 tables.

34175 **Energy and water development appropriations for 1985. Part 6. Hearings before the Committee on Appropriations, House of Representatives, Ninety-Eighth Congress, Second Session.** Washington, DC; Government Printing Office (1984). 1542p.

Part 6 of the hearing record covers testimony by representatives of DOE and the Nuclear Regulatory Commission (NRC) which was given in Executive Session over four days because of the sensitive nature of some of the information. The DOE witnesses discussed the design, testing, and manufacture of nuclear weapons and described DOE support for military applications of inertial fusion. Other responsibilities include the production, verification and monitoring of nuclear materials, and the dissemination of classified information. Chairman Nunzio Palladino and other officials of the NRC were asked to include comments on the licensing problems at the Byron and Zimmer plants in their review of the NRC budget requirements and program plans.

34176 **(NUREG/CR—3759) Lightning strike density for the contiguous United States from thunderstorm duration records.** MacGorman, D.R.; Maier, M.W.; Rust, W.D. (National Oceanic and Atmospheric Administration, Norman, OK (USA). National Severe Storms Lab.). May 1984. 50p. NTIS, PC A03/MF A01 - GPO* $4.00. Order Number DE84901264.

An improved lightning ground strike climatology has been obtained from thunderstorm duration data recorded by 450 air weather stations. From lightning strike location data collected in Florida and Oklahoma, it was found that strike density could be estimated from thunderstorm duration by the equation N/sub s/ = $0.054H^{1.1}$, where N/sub s/ is the number of strikes per square kilometer and H is thunderstorm duration in hours. This relationship was applied to thunderstorm duration data from the aviation stations to obtain lightning strike density for the contiguous United States.

34177 **(AD-A—137863/7) Application of methods of numerical and software engineering analysis to physical and engineering data collected in a variety of laboratory and field measurement programs. Final report Sep 80-Sep 83.** Moss, P.; Wadzinski, H.; Dechichio, D.; Jenkins, A.; Meehan, P. (Bedford Research Associates, MA (USA)). 28 Oct 1983. 41p. NTIS, PC A03/MF A01.

This report presents a summary of analyses and mathematical modelling done in support of some AFGL atmospheric research projects. In particular, work on the problems of linear filtering on intensity data, broadening of peaks in the photoelectron energy spectrum, and interactive OPAQUE file editing are discussed.

34178 **(DOE/BP—257) Airborne wind measurements at Cape Blanco, Oregon.** Lin, J.T.; Veenhuizen, S.D. (United Industries Corp., Bellevue, WA (USA)). Dec 1983. Contract AC79-82BP34337. 48p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013662.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The airborne wind measuring system using a fixed wing airplane and a Loran-C navigation unit was proven to be feasible to provide the large scale background wind flow for initialization of numerical wind modeling. The rms errors in the airborne wind measuring system were +- 2 mph in wind speed and +- 12 degrees in wind direction. The advantages of this method were that wind speeds over a large area (5 miles x 14 miles, or 18 miles x 30 miles)

may be determined rapidly, economically and at altitudes above the normal altitudes of TALA kite mesurements. The disadvantages were that the spatial resolution of the measurements was poor and near surface measurements were not feasible using a fixed wing aircraft. 1 reference, 10 figures, 1 table.

34179 **(ORNL—6041) User's manual for TOX-SCREEN: a multimedia screening-level program for assessing the potential fate of chemicals released to the environment.** Hetrick, D.M.; McDowell-Boyer, L.M. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 295p. (EPA—560/5-83-024). NTIS, PC A13/MF A01; 1; GPO Dep. Order Number DE84013619.

Portions are illegible in microfiche products.

A screening-level multimedia model called TOX-SCREEN has been developed to assess the potential fate of toxic chemicals released to air, surface water, or soil. Four types of surface water bodies are considered: lakes, rivers, estuaries, and oceans. TOX-SCREEN was developed at the request of the US Environmental Protection Agency (USEPA) to provide a means by which chemicals classified under Section 4 of the Toxic Substances Control Act (TSCA) can be rapidly evaluated with respect to their potential for accumulation in environmental media. The model is simplified in nature and is intended to be used as a screening device to identify chemicals that are unlikly to pose problems even under conservative assumptions. The purpose of this report is to provide a user's manual for the FORTRAN IV computer code, TOX-SCREEN, which implements the multimedia model. A brief description of the model assumptions and structure is included. The structure of the TOX-SCREEN program and individual subroutines are described in detail. Input to and output from the code are thoroughly explained. Parameter definitions, sample job control language, sample input data, output from TOX-SCREEN using the sample input data, and a listing of the program are provided in appendixes. Also, methods for estimating bioaccumulation in food chains, added recently to TOX-SCREEN, are documented in an appendix. 21 references, 9 tables.

34180 **(PB—84-155837) EPA (Environmental Protection Agency) Complex Terrain Model Development: third milestone report 1983. Interim report Jun 82-Jun 83.** Lavery, T.F.; Strimaitis, D.G.; Venkatram, A.; Greene, B.R.; DiCristofaro, D.C. (Environmental Research and Technology, Inc., Concord, MA (USA)). Nov 1983. 293p. NTIS, PC A13/MF A01.

See also PB84-220020.

The U.S. Environmental Protection Agency is sponsoring the Complex Terrain Model Development program, a multi-year integrated program to develop and validate practical plume dispersion models of known reliability and accuracy for simulating one-hour-average ground-level concentrations downwind of elevated sources during stable atmospheric conditions in complex terrain. The first major component of the Complex Terrain Model Development program was a field study conducted during the fall of 1980 at Cinder Cone Butte, a roughly axisymmetric, isolated 100-meter-tall hill located in the broad Snake River Basin near Boise, Idaho. The second field study was performed during 1982 at Hogback Ridge, an 85-meter-tall two-dimensional ridge located west of Farmington, New Mexico. This report documents work performed subsequent to the Second Milestone Report to combine two preliminary complex terrain models developed from the Cinder Cone Butte data base into the Complex Terrain Dispersion Model (CTDM), and to contrast the performance of CTDM with three existing complex terrain models using measurement data from both the Cinder Cone Butte and the Hogback Ridge field experiments. A description of the Hogback Ridge field study is also included.

34181 **(PB—84-157700) WNDCOM: Estimating surface winds in mountainous terrain. Forest service general technical report (final).** Ryan, B.C. (Forest Service, Berkeley, CA (USA). Pacific Southwest Forest and Range Experiment Station). 1983. 15p. NTIS, PC A02/MF A01.

WNDCOM is a mathematical model for estimating surface winds in mountainous terrain. By following the procedures described, the sheltering and diverting effect of terrain, the individual components of the windflow, and the surface wind in remote mountainous areas can be estimated. Components include the contribution from the synoptic scale pressure gradient, the sea breeze, the slope wind, and the valley wind. For each component, a brief description, the data and information needed for estimation, and step-by-step procedures are provided.

34182 **(PB—84-158302) User's manual for the Plume Visibility Model (PLUVUE II). Final report 23 Feb-29 Aug 83.** Seigneur, C.; Johnson, C.D.; Latimer, D.A.; Bergstrom, R.W.; Hogo, H. (Systems Applications, Inc., San Rafael, CA (USA)). Feb 1984. 293p. NTIS, PC A13/MF A01.

See also PB81-163297.

This publication contains information about the computer programs for the Plume Visibility Model PLUVUE II. A technical overview of PLUVUE II and the results of model evaluation studies are presented. The source code of PLUVUE II, as well as two sets of input and output data, is provided. This model is based on Gaussian dispersion assumptions, chemical reactions of plumes in nonurban atmospheres, light scattering and absorption characteristics of aerosols and gases, and radiative transfer along different lines of sight. PLUVUE II differs from the original Plume Visibility Model (PLUVUE) by an improved treatment of multiple scattering of light by aerosols and the incorporation of light absorption by carbonaceous aerosols. PLUVUE II is applicable to assessing visibility impairment due to pollutants emitted from well-defined point sources.

34183 **(UCRL—90053) Experimental and model transport and diffusion studies in complex terrain with emphasis on tracer studies.** Dickerson, M.H.; Foster, K.T.; Gudiksen, P.H. (Lawrence Livermore National Lab., CA (USA)). Feb 1984. Contract W-7405-ENG-48. 18p. (CONF-8403119—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013076.

From OHOLO conference on boundary layer structure; Zichron Ya'acov, Israel (25 Mar 1984).

The U.S. Department of Energy (DOE) Atmospheric Studies in Complex Terrain (ASCOT) program began in the fall of 1978 as a multiple DOE and other Federal Laboratory program devoted to developing a better physical understanding of atmospheric boundary layer flows in areas of complex terrain. The first technical challenge undertaken by the program was an investigation of atmospheric boundary layer phenomena associated with the development, continuation and breakup of nocturnal drainage wind flows. This paper discusses the general objectives the program has addressed during the past several years and focuses on results from a major field experiment conducted in 1980 in The Geysers area of northern California. Specifically, results from measurements of simultaneous tracer releases are compared to calculations from a mass-consistent wind field model coupled to a particle-in-cell transport and diffusion model. Results of these comparisons show that model calculations agree with measurements within a factor of 5 approximately 50 percent of the time. Part of the difficulty faced by the models in these comparison studies is associated with large variabilities between measurements made by samplers located one or two Δx apart when compared to the resolution of the models. Space and time averaging improves the comparisons considerably, although the design of the field experiment did not allow the determination of optimum spacial and temporal averages. 14 references, 9 figures, 2 tables.

34184 **Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging.** Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). 714p. (CONF-821136—Vol.1). Elsevier Science Publishing Co., Inc., 52 Vanderbilt Avenue, New York, NY 10017. Order Number TI84002447.

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

These two volumes contain papers prepared for and presented at the Fourth International Conference on Precipitation Scavenging, Dry Deposition, and Resuspension (the Chamberlain Meeting) held during 29 November to 3 December, 1982 in Santa Monica, California. Papers presented are abstracted separately.

34185 Pollutant deposition as a result of interception of wind-driven cloud - measurements made at a site in northern England. Dollard, G.J.; Unsworth, M.H. (Univ. of Nottingham School of Agriculture, England). pp 161-170 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Cloud droplet fluxes to vegetation at a moorland site in northern England were measured. Deposition rates for various elements contained in the droplets were determined. Concentrations of sulfate and nitrate in cloud water were much higher than expected for rainfall in the area indicating that scavenging in clouds is responsible for much of the chemical content of precipitation.

34186 Significance of snow crystal and mountain-surface riming to the removal of atmospheric trace constituents from cold clouds. Borys, R.D.; Demott, P.J.; Hindman, E.E.; Feng, D. (Colorado State Univ., Fort Collins). pp 181-190 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

On the average, at SPL, cloud water contains 3 times the acidity and 4 to 5 times the conductivity of unrimed snow crystals. Rime deposits directly to the mountain surface and on ice crystals can contribute more than 60% of the total water in the snowpack. Combining these results with the observed factor of 10 enrichment of trace constituents in rime ice, up to 94% of the total trace constituents in a snow pack may be due to rime ice deposits, excluding below-cloud and dry depositional processes. This data set is small and preliminary. General agreement with other observations suggest it may be applicable in other regions. Further studies are needed to broaden the data base and to include soluble ion and trace element chemistry of the snow and cloud water. Efforts should be made in the future to address the cause of the observed variability in snowfall chemistry by linking in-cloud scavenging processes with sources of natural and man-made aerosol particles and gases. 19 references, 1 figure, 1 table.

34187 In-cloud scavenging and resuspension of cloud active aerosols during winter storms over Lake Michigan. Saxena, V.K.; Hendler, A.H. (North Carolina State Univ., Raleigh). pp 91-102 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). Contract AS05-81EV10498.TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Analysis of extensive measurements of cloud condensation nuclei (CCN) activity are presented to describe the fate of the aerosol population as it interacts with the clouds. Simultaneous measurements of atmospheric sulfate content and measurements of cloud water composition recorded by the Battelle, Pacific Northwest Laboratory (PNL) are analyzed here to determine the effectiveness of the cloud nucleation process in accounting for the sulfate content of cloud water. The sampling program was conducted during November 1978 and January 1979, in cooperation with the PNL and under the auspices of the Multi-State Atmospheric Power Production Pollution Study (MAP3S). Some results from the MAP3S program have previously been presented. 27 references, 3 figures, 4 tables.

34188 Characteristics of non-precipitating stratiform clouds. Castillo, R.A.; Jiusto, J.E. (State Univ. of New York, Albany). pp 115-124 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The study of precipitating versus non-precipitating stratiform clouds at Whiteface Mountain, New York indicates that there is some modification of the cloud droplet spectra as evidenced by a significant difference between median LWC d_o, (student's test: 10% level of confidence). The three different methods of obtaining liquid water content were all in good agreement and (d_o) gave the best indication of droplet spread. The cloud water chemistry of dissipating stratus and non-precipitating stratus indicated pH values of 3.5 and 3.7, with a pH of 5.0 for precipitating stratiform. In the three categories presented, the $[H^+]$, $[NH_4^+]$, $[Na^+]$, $[Mg^{+2}]$ and $[Ca^{+2}]$ all indicated significant differences at the 5% level of confidence. An intercomparison of $[NH_4^+]$, $[SO_4^{-2}]$ and $[NO_3^-]$, indicates the importance of the $[NO_3^-]$ in contributing to cloud water acidity. In both categories - precipitating and non-precipitating - the evidence points toward strong acid formation within the cloud. 10 references, 5 tables.

34189 Design and calibration of a rotating arm collector for ambient fog sampling. Jacob, D.J.; Flagan, R.C.; Waldman, J.M.; Hoffmann, M.R. (California Inst. of Tech., Pasadena). pp 125-136 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The design of the collectors to sample ambient fog for chemical analysis has been discussed. A rotating arm collector where droplets impact at high speed in slots milled into the leading edges of a rotating rod was found to satisfy criteria for fog sampling. The experimentally determined size cut is 8 μm, which excludes the submicron aerosol from the sample while collecting most fog droplets with high efficiency. The sampling rate is 5 $m^3\ min^{-1}$, and collection rates up to 2 ml min^{-1} have been obtained in the field. A lower size cut could be achieved by using a longer arm and thus increasing the impacting speed of the droplets. This implies the use of airfoil shapes or smaller collection bottles to cut down drag. Such prototypes are being built at Caltech but have not yet been tested in a wet environment. 14 references, 3 figures, 1 table.

34190 Fogwater composition in southern California. Waldman, J.M.; Munger, J.W.; Jacob, D.J.; Hoffmann, M.R. (California Inst. of Tech., Pasadena). pp 137-148 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Exceedingly high concentrations of SO_4^{2-}, NO_3^-, NH_4^+ and H^+ were observed in fogwater collected in southern California, highest during fog events following smoggy days. The pH of most samples ranged from 4.0 to 2.5. Secondary aerosols represent the most likely source of these solutes. High levels of trace metals, sulfite and formaldehyde were also observed. Physical processes (i.e., condensation and evaporation) along with scavenging of gaseous and aerosol components appear to control observed fogwater composition. Chemical processes occurring within fog droplets seem also to contribute to the high level of acidity found. Scavenging of ammonia (gaseous or particulate) and calcareous dust was observed to partially neutralize acidity due to NO_3^- and SO_4^{2-} and their precursors. 34 references, 2 figures, 2 tables.

34191 Chemistry of nighttime urban fogs. Jacob, D.J.; Hoffmann, M.R. (California Inst. of Tech., Pasadena). pp 149-160 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A model has been developed to interpret the observed chemistry of urban fogs. Droplet-phase S(IV) oxidation is found to be a significant source of sulfate, and H_2O_2 and O_3 (metal-catalyzed) are the important oxidants. At ambient formaldehyde concentrations the formation of the formaldehyde-sulfite adduct has no effect on the net S(VI) formation rate. Predicted fogwater concentrations are found to be consistent with field results. The present model needs to be refined further by the use of multidimensional calculation routines to allow for a complete treatment of complexation and precipitation equilibria. Scavenging of small aerosol particles by diffusion may also be significant and will be included in future generations. 12 references, 2 figures, 4 tables.

34192 Characterization of the inorganic chemistry of the precipitation of North America. Semonin, R.G.; Bowersox, V.C. (Illinois State Water Survey, Champaign). pp 191-202 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). Contract AC02-76EV01199.TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The inorganic chemistry of precipitation of North America has not been adequately described in the past due to the inadequacy of available data. The recently initiated national networks for precipitation sampling in both Canada and the United States have now been in operation sufficiently long to permit a first estimate of the relative and absolute concentrations of various ionic constituents. Among the principal features of the several distributions are (1) the sea salt constituents, sodium and chloride, exhibited relative maximums along the east and west coastal regions of North America; (2) elements commonly associated with crustal dust, that is, magnesium and calcium, maximized in the continental interior; (3) relative ammonium maximums are seen in the central Great Plains and may be associated with particular agricultural practices in that area; and (4) those ions of most concern to air quality and acidic precipitation considerations maximize in the industrialized east with the sulfate and nitrate maximums in southern Ontario paralleling the St. Lawrence valley and the hydrogen ion maximum in the US over the Ohio River valley.

34193 Interpretation of sequential rain sampling results. Asman, W.A.H.; Jonker, P.; Slanina, J.; Baard, J.H. (Inst. for Meteorology and Oceanography, Utrecht, Netherlands; Netherlands Energy Research Foundation, Petten). pp 265-274 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Two sequential rain samplers were used to collect simultaneous samples in order to examine the statistical variability of sequential sampling on an event basis. Concentrations of two components were compared by plotting, on a logarithmic scale, each component versus the sample number. Because there was always some statistical variability in a data, a procedure to compare concentration curves was developed which would take statistical variability into account. For SO_4 and NO_3, the error function seems to be very good as for more than 80% of the couples of samples the internal difference is less than 10%. For the other parameters sampled, the curves were less satisfactory and may be due to the relative low concentration of the components in the rain events sampled. 3 references, 8 figures, 2 tables.

34194 Vertical variability and short-term temporal trends in precipitation chemistry. Munger, J.W.; Waldman, J.M.; Jacob, D.J.; Hoffmann, M.R. (California Inst. of Tech., Pasadena). pp 275-282 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The series of precipitation collectors in Pasadena and the adjacent mountain slopes are ideal for testing scavenging models. Relatively clean air masses in Pacific storms interact with the polluted air in the Los Angeles basin. Contact time between the two airmasses is short. Pollutants in Los Angeles are either mixed rapidly into the overlying clouds, where the aerosol may act as condensation nuclei, or they are removed by below-cloud scavenging, which is most effective for gases and large particles. Data collected so far suggest that BCS, primarily of gases, accounts for up to half of the H^+, NH_4^+, and NO_3^- present in Los Angeles area precipitation. Dissolution of SO_2 and oxidation to H_2SO_4 within the falling raindrops also appears to be important. The concentrations observed in high altitude precipitation suggest that some mixing of pollutants into the clouds must occur. The present data are insufficient to judge the relative importance of in-cloud and below-cloud scavenging for stratus-cloud precipitation. 9 references, 2 figures, 4 tables.

34195 Nitrate in precipitation: how are the observed concentrations explained. Altwicker, E.R. (Rensselaer Polytechnic Inst., Troy, NY). pp 283-292 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Order-of-magnitude analysis starting with observed field concentrations of gaseous nitric acid and nitrate ion in precipitation makes the aqueous phase concentrations plausible. In-cloud processes would appear to lead to equilibrium concentration, below cloud processes may encounter higher (than in-cloud equilibrium) gas phase concentrations, but there may not be sufficient time to reach equilibrium. Though there appears to be a weak inverse relationship between gas phase nitric acid concentration and concentrations found in precipitation, the diurnal variation in nitric acid in the gas phase is as large or larger, which means that the above analysis needs to be extended to understand other removal processes. 21 references, 4 figures, 1 table.

34196 Precipitation scavenging of submicron particles released by rockets into convective clouds. Lacaux, J.P.; Warburton, J.A. (Centre de Recherches Atmospheriques, Observatoire du Puy de Dome, France; Desert Research Inst., Reno, NV). pp 303-314 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Two case studies are presented. The objective of each study was to determine the trajectory, residence time and dispersion of AgI particles introduced into clouds by the soviet-type rockets as a function of the internal structure of the cloudy cells. Three-dimensional and temporal radar measurements of the internal structure of 2 storm cells show: they were unicellular with well-defined cores of precipitation; and the trajectories of the rockets were confined to the precipitation columns which were the locations of the maximum reflectivities. The silver content of the precipitations gives the same response for the 2 storms as follows: the residence time of

AgI particles in clouds was very short; the particles were confined and scavenged in the columns of precipitation; and the 2 cases exhibited spotty deposition. These results were then compared to results reported from the USSR. 6 references, 5 figures, 4 tables.

34197 **Rate and chemistry of wet deposition derived from time series of natural radioactivity.** Weiss, W.; Wagner, C.; Schlosser, P.; Stockburger, H.; Sartorius, H.; Volpp, J.; Ditschmann, R.; Wagenbach, D.; Muennich, K.O. (Universitaet Heidelberg, Germany; Rosastrasse, Freiburg, Germany). pp 315-322 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Time series of natural radioactivity as used in this paper provide a powerful tool for the study of the wet removal processes. They are particularly useful if the mechanisms and the efficiency of the removal processes are to be investigated during individual precipitation events. A comparison of the atmospheric inventory with the radioactivity flux to the ground provides additional information about the tracer balance and the processes in question. The behavior of the tracer used is different from that of many other constituents of the atmosphere inasfar as it is continuously produced within the atmosphere by radioactive decay of the noble gas ^{222}Rn. A continuation of this work therefore has to include other atmospheric constituents which do not show this particular behavior. From the methods available for a measurement of other constituents the electrical conductivity measurement has been chosen because it provides the same time resolution as the radioactivity measurement. Instrumentation for continuous conductivity measurements during precipitation has been developed, and preliminary results are available.

34198 **Coupled gas-phase/aqueous phase free radical chemistry of a cloud.** Chameides, W.L.; Davis, D.D. (Georgia Inst. of Tech., Atlanta). pp 431-444 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Model calculations which simulate the time dependent, coupled gas-phase and aqueous-phase chemistry of a cloud indicate that free radicals can have a major impact upon the generation of acids in cloudwater. For an accommodation coefficient of 0.01, roughly one-half of the SO_2 converted to SO_4^{2-} was found to be caused by aqueous-phase free radical reactions. Principal among these is the reaction of aqueous-phase OH with HSO_3^-. Reactions of dissolved SIV with H_2O_2 and O_3 were also found to be important in producing SO_4^{2-}. Furthermore the reaction of aqueous-phase OH with $OHCH_2OH$, the dissolved form of H_2CO, was found to lead to a significant rate of production of HCOOH in cloudwater. It should be noted that large uncertainties are associated with the calculations. Many of the aqueous-phase rate constants used in the model are not well-defined. The uncertainty in the OH and HO_2 accommodation coefficients is a potential source of significant error. Furthermore, the model neglected and simplified many of the complex dynamical and microphysical processes of clouds (i.e. a monodisperse, temporally constant droplet distribution was assumed, temperature was held fixed, and entrainment was neglected). 34 references, 4 figures.

(Univ. of California, Los Angeles). pp 445-452 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A mathematical model was developed to simulate the diffusion of sulfur dioxide into a raindrop falling at terminal velocity. The model was simplified by considering total sulfur rather than each sulfur component and by assuming a spherical vortex and velocity scales comparable to observed velocities. The model was verified by a series of laboratory experiments. Results supported the model up to drop sizes greater than 600 μm. Sulfur absorption at this size was significantly greater than predicted. This was due to enhanced eddy diffusion in larger particles. The model was changed to incorporate this behavior. 10 references, 4 figures.

(Univ. of Nevada System, Reno). pp 471-482 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Cloud chamber experiments of SO_2 oxidation to sulfate within cloud droplets have confirmed that the particles resulting from the subsequent evaporation of these droplets are larger and exhibit lower S/sub c/ values than the original CCN. Calculations invoking Koehler theory, atmospherically relevant cloud situations and aqueous SO_2 conversion rates point to conditions where this CCN activity enhancement is significant, i.e., in a subsequent cloud involvement these CCN assume a preferential role as early acting nuclei. With the use of a cloud mixing model it was shown that entrainment of dry air into a cloud may provide conditions that give the enhanced CCN an even better advantage for growing into larger droplets than would be the case at initial condensation at cloud base. Thus, the CCN enlargement by in-cloud SO_2 scavenging and oxidation may be the first stage in a process of selective precipitation scavenging of sulfates. 18 references, 6 figures, 1 table.

34201 **Solubility measurements of aerosols in the Greenfield gap to determine efficiency of in-cloud scavenging by nucleation.** Alofs, D.J.; Trueblood, M.B. (Univ. of Missouri, Rolla). pp 483-492 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A study was conducted to determine whether a size region exists where nucleation causes scavenging of all cloud particulates. In order for this to occur, the following propositions must be true. Proposition A is, there exists a critical radius (a^*) such that all particles with $a > a^*$ are scavenged by nucleation, and all particles with $a < a^*$ are not scavenged. Proposition A would be true if the following two propositions are each true: proposition B, all particles of the same size have the same critical supersaturation (S/sub c/), and S/sub c/ is a decreasing function of particle size; and proposition C, each cloud has a supersaturation (S^*), such that all particles with S/sub c/ $< S^*$ nucleate cloud droplets and particles with S/sub c/ $> S^*$ do not. Proposition C is assumed to be true for marine aerosols, proposition B (and, hence, proposition A) is false, but for continental aerosols it is probably true, especially in highly industrialized regions such as greater eastern United States. 23 references, 2 figures, 1 table.

34202 **Deposition of submicron particulates on model scavengers.** Podzimek, J.; Martin, J.J. (Univ. of Missouri, Rolla). pp 493-504 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Information about the type of motion of 28 planar models falling in quiescent air was obtained and several important parameters such as the mean values of V/sub z/, V/sub x/, C/sub D/, N/sub Re/, and N/sub Be/ amplitude and frequency of the oscillatory motion were determined. Comparison of the results of the analysis of stroboscopic pictures of models falling in still air with the behavior of similar models falling through a horizontal air flow of 0.7 m/s shows that one can find mean values of aerodynamic parameters of falling scavengers, except the situation when the model starts to tumble. The experiments with disk type models exposed to smoke particles in a wind tunnel demonstrated that in the range of N/sub Re/ from 100 to 700, a considerable part of particles is deposited on the rear side of scavengers. The total scavenging efficiency of these models is between 1% and 2%, depending on the N/sub Re/ and type of aerosol. The swinging of the models will probably not change much the total scavenging efficiency of disk type models. 15 references, 8 figures.

34203 **Scavenging of submicron particles in mixed clouds: physical mechanisms - laboratory experiments.** Prodi, F. (Istituto Fisbat-CNR, Bologna, Italy). pp 505-516 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A review of the scavenging mechanisms and of their superposition indicates that transient phenomena and their relaxation times should be better investigated. Time dependent treatments are required in particular by the time dependent Brownian motion, by the oscillations of falling crystals, and by thermal effects induced by the actual shapes of the crystals. The main results of the experimental tests are: a remarkable decrease in aerosol concentration is observed when cloud droplets evaporate toward growing ice crystals (this supports the efficacy of thermophoretic collection by evaporating droplets suggested by Slinn and Hales); and the examination of individual crystals has shown that growing ice crystals are scavengers of NaCl aerosol particles in the small size range. On the other side no scavenged particulates of 0.35 μm size of carnauba wax have been detected on ice crystals. The main limit in the experimental procedure followed is in the short growth times and consequent small crystal sizes which can be reached. To overcome these limitations a new experimental arrangement has been designed in which ice crystals are grown suspended in a gentle updraft in a closed circuit tunnel located in the cold room. 9 references, 4 figures.

34204 **Particle scavenging by evaporating cloud drops.** Beard, K.V.; Ochs, H.T. III; Leong, K.H. (Illinois State Water Survey, Champaign; Univ. of Illinois, Urbana). pp 517-528 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The capture efficiency for a hollow particle has been determined as a function of collector drop size. The particle was sufficiently large so that phoretic theory in the slip regime should apply. On the other hand the particle mass was quite small and inertial capture was insignificant. The measured capture efficiencies for this unusual particle were significantly above values predicted by theory. The consistency of the experimental data and our analysis of potential experimental errors suggest that the measured values are reliable. Therefore, the discrepancy between observation and theory may result from an insufficiency in phoretic theory or an inadequacy in the application of this theory to our experiment. If this is the case our computations would indicate an underestimation of the effects of thermophoresis by theory. The phoretic capture efficiencies obtained for the cenospheres at about 91% relative humidity are comparable to the capture efficiencies of particles due to charge effects in thunderstorm conditions. Hence, for cenospheres or particles with low conductivity, thermodiffusiophoresis may be a major mechanism promoting particle capture by hydrometeors. However, the limited data presented here and in other works does not provide a definitive assessment of phoretic particle capture. In addition the atmospheric aerosol is composed of a substantial fraction of wet or liquid particles, especially in high humidity conditions, and the phoretic scavenging of such particles needs to be evaluated. 16 references, 2 figures.

34205 **Comparison of in-cloud scavenging by Brownian diffusion and thermo and diffusio-phoresis.** Carstens, J.C.; Martin, J.J. (Univ. of Missouri, Rolla). pp 529-540 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

This study provides a basic model coupling phoretic and diffusive transport. The model is then used to evaluate the extent to which phoresis alters purely diffusive scavenging. Special attention is given to its retarding tendency in-cloud. Under conditions of growth, phoresis opposes diffusion. That is, phoretic drift tends to retard diffusive scavenging. 12 references, 1 table.

34206 **Experimental study of electrostatic effect on aerosol scavenging by snow crystals.** Murakami, M.; Magono, C. (Hokkaido Univ., Sapporo, Japan). pp 541-550 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

In order to study the electrostatic charge effect on the collection efficiency, experiments on snow scavenging were carried out using natural snow crystals in an aerosol chamber. The following results were obtained. The enhancement of collection efficiency due to the snow crystal charge increased with the decreasing aerosol size, and became the maximum at around 0.2 μm in diameter. And as for the submicron aerosol particulates the enhancement was about one order of magnitude. 3 references, 5 figures, 1 table.

34207 **Laboratory study of the scavenging of sub-micron aerosol by charged raindrops.** Barlow, A.K.; Latham, J. (UMIST, Manchester, England). pp 551-560 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The collection efficiencies (E) for small charged raindrops falling through a cloud of submicron aerosols were measured. The results agree with other workers, however, the scatter in the data is large. The tendency for E to increase with charge was confirmed and the values of E for charges similar to those of thunderstorms were near 1%, which is about two orders of magnitude greater than the corresponding values in the absence of electrical forces.

No systematic differences were found between positive and negative drops. 15 references, 5 figures.

34208 **Effect of electric charges on the efficiency with which columnar ice crystal scavenge aerosol particles.** Wang, P.K.; Chuang, C.H. (Univ. of Wisconsin, Madison). pp 561-572 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A two model theoretical approach for the study of the effect of turbulence on the inertial impaction-type scavenging of large aerosol particles is presented. Each model computes individual particle trajectories relative to the collector drop. Such trajectories, which are the result of numerical integration of the particle equation of motion, are governed by the air flowing around the falling collector drop, the inertia of the particle, the gravitational force on the particle, and the ambient turbulence. The first model evaluates the effect of vertical accelerations of the drop relative to the air caused by the turbulence. The second model treats the effect of the smallest scale of turbulence, namely the Kolmogorov microscale, on the motion of the aerosol particle. 8 references.

34210 **Turbulent aspects of rainout.** Rosenkilde, C.E.; Serduke, F.J.D. (Lawrence Livermore National Lab., CA). pp 589-596 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The possible effect of atmospheric turbulence on enhancing the in-cloud scavenging of aerosol particles with radii $0.01 < r < 1$ μm which may interact with cloud water droplets having radii $5 < r < 30$ μm was studied. No significant augmentation due to turbulence of the Brownian diffusivity within the context of convective diffusion of submicron aerosols to cloud droplets in normal fields of atmospheric turbulence was identified. This leaves only the augmentation of the settling velocity which is much less than a factor of 15 except in extreme circumstances. The overall enhancement of the scavenging kernel in the presence of turbulence, over that for common convective diffusion, seems difficult to increase beyond a factor of 4 even in the most favorable circumstances. 12 references, 2 tables.

(Univ. of California, Los Angeles). pp 609-616 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A model has been developed to provide aerosol deposition rates under a variety of atmospheric conditions. A series of simulations with varying initial soundings and aerosol distributions, aerosol sizes, and microphysical parameters are planned. The results will show the rate at which aerosol is brought to earth and the geometrical patterns of deposition. It will also show the redistribution of aerosol in the atmosphere as a result of thermal convection. Further simple computations will show the efficiency of various kinds of thermal convection in capturing and bringing aerosol materials to the earth. 17 references.

34212 **Distribution of acidity in convective clouds due to the aqueous phase oxidation of sulfur dioxide by ozone: a numerical simulation.** Sarma, R.A. (South Dakota School of Mines and Technology, Rapid City). pp 617-626 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A two-dimensional cloud model has been used to simulate the aqueous phase oxidation of sulfur dioxide by ozone in convective clouds. It was found that the acidity of cloud water is a function of its location in the cloud. Simulation of sulfur dioxide effluents from a 1000MW power plant suggests that the rain from a cloud close to the source could be 2.5 times more acidic than the rain from a cloud 4 km away from the source. 23 references, 4 figures.

34213 **Three-dimensional mesoscale numerical simulation of atmospheric cleansing during the 1982 Boulder upslope cloud observation experiment (BUCOE).** Chaumerliac, N.; Nickerson, E.; Rosset, R. (Laboratoire Associe de Meteorologie Physique, Clermont-Ferrand, France; National Oceanic and Atmospheric Administration, Boulder, CO). pp 627-648 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A three-dimensional, time-dependent mesoscale model with the capability of predicting precipitation over mountainous terrain has been extended to include aerosol precipitation scavenging processes. The model links the dynamical, microphysical, and scavenging processes, thereby accounting for advection, attachment to cloud droplets, and the removal by rain and ice of the aerosol particles. The main results are summarized below. The upslope situation is well reflected by the model; clouds are building up over the Rocky Mountains and spreading out on the plains. The precipitation pattern provides rain in the vicinity of Denver, the only precipitation area observed. The model produces a very small amount of ice, which is in agreement with observations on the 11th of May, but which made it difficult to quantitatively evaluate the ice scavenging parameterization in this particular simulation. The ice scavenging parameterization was, however, tested in another case. We notice the same behavior in the number aerosol concentration, both in the presence of clouds and without clouds, as was observed during the experiment. Vertical profiles of aerosol concentration reveal that in the presence of precipitation, scavenging is very evident and that otherwise advection effects dominate. The main feature of our results is that the model has the capability to simulate aerosol removal by precipitation as a two-stage process: rain scavenges not only aerosols free in the air but also aerosols already attached to cloud droplets. 12 references, 9 figures, 1 table.

34214 Intercomparison of the washout of $SO_4$2p from a single-layer regional transport model with a multilayer vertical-motion regional transport model. Davis, W.E. (Pacific Northwest Lab., Richland, WA). pp 663-674 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The main conclusion is that there are obvious differences between the results of the eight-layer model and the constant-layer model. The inclusion of vertical motion significantly changed the air concentrations as well as deposition of SO_4^{2-}. A preliminary conclusion is that the eight-layer model run in a series of modes was not able to compute air concentration patterns and deposition results that fit the observed. The best fit of the air concentrations was with using only the diurnal rate of conversion of SO_2 to SO_4^{2-}. The best fit of the deposition was found using the eight-layer model with in-cloud conversion. The constant layer model did a poor job in fitting the observed air concentrations as well as the observed wet deposition. There are two recommendations. The first, is to use models with vertical motion simulation for acid rain, and the second is that a better description should be provided of chemical transformation under conditions of saturation of SO_2 to SO_4^{2-}. 22 references, 5 figures, 2 tables.

34215 Effects of in-cloud scavenging on the transport and gas phase reactions of SO/sub x/, NO/sub x/, HC/sub x/, H/sub x/O/sub y/, and O_3 compounds. Carmichael, G.R.; Kitada, T.; Peters, L.K. (Univ. of Iowa, Iowa City; Toyohashi Univ. of Tech., Japan; Univ. of Kentucky, Lexington). pp 675-686 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A preliminary investigation into the effects of in-cloud scavenging on the vertical distribution of trace gases using a one-dimensional subset of a recently developed regional-scale combined transport/chemistry model has been presented. The model has sufficient detail to model urban boundary layer as well as non-urban free troposphere chemistry, boundary layer-free troposphere exchange in cloud free and cloudy environments, and in-cloud wet removal and chemistry processes. Results from test calculations show that clouds can greatly effect the vertical distributions by affecting the photon flux both below and directly above clouds, and by the preferential removal of the soluble gases in the cloud. 4 references, 3 figures, 3 tables.

34216 Precipitation scavenging of highly soluble gases. Dawson, G.A.; Brimblecombe, P. (Univ. of Arizona, Tucson; Univ. of East Anglia, Norwich, England). pp 687-696 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

With some simplifying assumptions as to physical processes and cloud types, a mean coefficient for wet removal of highly soluble gases has been calculated; it was close to 3×10^{-6} s^{-1}, i.e., a residence time of about 4 days. The calculations indicated that mean scale heights of such gases are likely to be less than 2 km. For this paper, the criterion of high solubility was taken to be K/sup H/ $\geqq 10^5$ mol l^{-1} atm^{-1}. Gases that are effectively highly soluble include HCl, HNO_3, H_2SO_4, H_2O_2, NH_3 in acid droplets, and SO_2 in the presence of strong oxidants. The treatment should have most applicability to highly soluble gases originating at or near the surface. 14 references, 3 figures.

34217 Statistics of wet deposition. Baker, M.B.; Egbert, G.; Erickson, K.B.; Harrison, H. (Univ. of Washington, Seattle). pp 697-706 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Results obtained from a stochastic model of the atmospheric portion of a tracer life cycle, which does explicitly incorporate the event nature of the precipitation sink are summarized. This extends earlier work which focused on the computation of the statistics of the airborne concentration of a tracer for which the major sink was wet deposition. In Section II the earlier model is reviewed, and in Section III it is extended to the calculation of distributions of the tracer concentration in precipitation. In Section IV the computation of extreme event frequencies, and in Section V the effect of transport, which requires the transformation of precipitation statistics from the Eulerian frame in which they are measured to the Lagrangian frame of the tracer are described. Section VI briefly reviews the results of comparison of model predictions with data and describes needed future work. 8 references.

34218 Spatial inhomogeneity of aerosols within an air parcel and some implications for the modelling of particle scavenging by convective clouds. Lozowski, E. (Univ. of Alberta, Edmonton). pp 707-718 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The use of a stochastic equation to model the statistics of convective scavenging is discussed. Implicit in this notion is the view that pollution properties are random variables, describable in terms of a probability density function with certain statistical properties. Equations are then compared to atmospheric chemistry data collected over Ontario in September 1981. 9 references, 3 figures.

34219 Precipitation scavenging and tropospheric mixing. Rodhe, H. (Univ. of Stockholm, Sweden). pp 719-729 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A simple transport/scavenging model has been used to demonstrate that treating vertical mixing through the troposphere and scavenging by clouds and precipitation as separate processes can lead to significant errors in the estimate of vertical distribution of certain water-soluble trace gases. The direct association of the scavenging with the vertical mixing process requires the following modifications to be made of the classical equation for diffusion and scavenging. The numerical value of the vertical diffusivity is reduced by a factor that depends upon the average efficiency of removal per mixing step. If the removal efficiency is asymmetric relative to the upward and downward moving eddies, a virtual vertical velocity has to be introduced. For normal cloud scavenging, this velocity can have a magnitude of a few mm s^{-1} for highly soluble gases. This effect is distinct from the vertical velocities introduced in a diffusion model by allowing for vertical variation of the air density or the eddy diffusivity. It is also distinct from the downward velocity imposed on aerosol particles and water-soluble gases by the sedimentation of the cloud droplets. The rate of removal is dependent upon the diffusivity, the average mixing length and the removal efficiency. The latter part of the paper contains a qualitative discussion of the application of the above concepts - the removal efficiency, in particular - to certain important trace compounds. It is shown that the cloud filter is particularly efficient for

NH_3 diffusing upwards from the surface. In areas with alkaline droplets, SO_2 should be trapped with a similar high efficiency. 11 references, 1 table.

34220 **(AD-A—137879/3) Chemical reactions and molecular aggregation in cryogenic whole air sample matrices. Final technical report 1 Oct 81-31 Mar 83.** Calo, J.M.; Lilly, W.D. (Brown Univ., Providence, RI (USA). Dept. of Engineering). Jul 1983. 119p. NTIS, PC A06/MF A01.

This report conveys the results of an investigation concerned with the effects of chemical reactions in cryogenically condensed NOx/Ox/H_2O samples, on the alteration of sample composition upon subsequent thermal desorption. These studies were undertaken to elucidate the relevant mechanisms and improve the understanding of these processes as they relate to the analysis of cryogenically-collected stratospheric whole air samples acquired in the balloon-borne sampling project of the composition task of the Stratospheric Environment Program of the Air Force Geophysics Laboratory. The results of this work indicate that interconversion of the oxides of nitrogen in condensed samples, especially in the presence of water vapor, is a significant process under certain conditions. However, additional work involving careful cryogenic deposition of very small amounts of the various species, combined with perhaps high resolution FTIR, is definitely needed in order to quantitatively assess the relative importance of these same processes in the much more highly dilute stratospheric cryogenic whole air samples.

34221 **(AD-A—139475/8) Influence of mixture distribution on emissions from an aircraft piston engine. Final report Jun 74-May 78.** Mirsky, W.; Nicholls, J.A. (Michigan Univ., Ann Arbor (USA). Dept. of Aerospace Engineering). Oct 1980. 83p. NTIS, PC A05/MF A01.

Cylinder-to-cylinder mixture ratio distributions were measured for both the injected and carbureted versions of the AVCO-Lycoming 0-320 engine to determine the effects of non-uniform distribution on the exhaust emissions of carbon monoxide, hydrocarbons, and oxides of nitrogen. Data for both normal and lean-out conditions were obtained. An experimental Turbulent Flow Manifold for the carbureted engine was tested as a potential means for improved cylinder-to-cylinder distribution. Results showed improvements for the low power operating modes but deterioration for the high power modes. An analysis based on test results predicts that the EPA emission requirements can be met, for this engine, by improving mixture distribution and leaning both the taxi-out and approach modes. Improvements in fuel economy are also predicted.

34222 **(BNL—34842) PRECP: PRocessing of Emissions by Clouds and Precipitation. The Department of Energy's program on the nonlinearity of acid precipitation processes. Summary of FY 1984-1985 Operational Plan.** Michael, P. (ed.). (Argonne National Lab., IL (USA); Brookhaven National Lab., Upton, NY (USA); Pacific Northwest Lab., Richland, WA (USA)). May 1984. Contract AC02-76CH00016. 33p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE84013119.

This report presents a summary of the FY 1984-1985 Operational Plan for the US Department of Energy's Program on the PRocessing of Emissions by Clouds and Precipitation (PRECP). Activities scheduled through 1985 are spelled out in some detail; the FY 1986 activities are sketched in somewhat less detail; and the plans for beyond FY 1986 are outlined in rather general terms. The full Operational Plan will be the third report in this series; the first report was the Preliminary Program Plan, which bore the title Nonlinearity of Acid Precipitation Processes (Michael, 1983). The objective and strategy of this project can be stated as follows: to determine how the wet deposition of acidic and other pollutants depends upon inputs to individual storms, by understanding the chemical and physical PRocessing of Emissions by Clouds and Precipitation (PRECP), through analysis of appropriate data, model development and testing, and laboratory and field studies, and for applications in the definition of the relationships between pollutant releases and subsequent deposition. 2 references, 4 figures, 5 tables.

34223 **(CONF-840501—1) CO_2 forecasting and control: a mathematical approach.** Daly, T.A.; Goto, N.; Kosobud, R.F.; Nordhaus, W.D. (Argonne National Lab., IL (USA); Yale Univ., New Haven, CT (USA); Illinois Univ., Chicago (USA)). 1984. Contract W-31-109-ENG-38. 20p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013454.

From Meeting of the American Association for the Advancement of Science; New York, NY, USA (24 May 1984).

Future concentrations of CO_2 were estimated by means of a mathematical programming approach. Certain price-sensitive demands for energy and a number of alternative technologies for meeting those energy demand paths are specified. Least cost is assumed for meeting energy demands. 4 references, 7 figures, 5 tables. (ACR)

34224 **(DTH-LET-RE—83-6) Total emission of CO, Hydrocarbons and NOsub(x) from the Danish carpark. Prognosis from year 1980 until 2000.** Schramm,J. (Danmarks Tekniske Hojskole, Lyngby. Lab. for Energiteknik). 1983. 105p. (In Danish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84750995.

Portions are illegible in microfiche products.

The total emission of carbon oxides, hydrocarbons and nitrogen oxides from the Danish automobiles is forecasted for the period 1980-2000. Gasoline cars and diesel trucks are simulated. Models are based on data for the respective vehicles. Some samples from the existing carpark have been tested for purpose of emission factors establishment.

34225 **(EML—423) Environmental Measurements Laboratory annual report 1983.** Volchok, H.L.; de Planque, G. (USDOE Environmental Measurements Lab., New York). Mar 1984. 123p. NTIS, PC A06/MF A01; GPO Dep. Order Number DE84013758.

Short descriptions of the more than 100 projects engaged in during the year are presented. Research for the most part involved the study of acidified lakes, the use of lake and reservoir sediments for understanding regional pollution history and further research on evaluating U.S. population doses from fallout resulting from atmoshperic nuclear tests in Nevada in the 1950's.

34226 **(EPRI-CS—3182-Vol.1) Proceedings of the 1982 joint symposium on stationary combustion NO/sub x/ control. Volume 1. Utility boiler applications.** (Electric Power Research Inst., Palo Alto, CA (USA)). Jul 1983. 703p. (CONF-8211146—Vol.1). Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101.

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

More than 50 papers describing recent advances in NO/sub x/ control technology were presented. These papers covered the following topics: utility boiler field experience; NO/sub x/ regulations; advanced combustion processes; NO/sub x/ flue gas treatment; limestone injection SO/sub x/ control; industrial process combustion; industrial, commercial, and residential systems; and fundamental combustion research. The Symposium Proceedings has been published in two volumes: Volume 1 - Utility Boiler Applications and Volume 2 - Fundamental Studies and Industrial/Commercial/Residential Applications. Separate abstracts were prepared for each paper.

34227 (EPRI-CS—3182-Vol.1, pp 3.1) **Update on acid deposition.** Demerjian, K.L. (Environmental Protection Agency, Research Triangle Park, NC). Jul 1983. Electric Power Research Institute, 3412 Hillview Ave., Palo Alto, CA 94304. Order Number TI84920101. (CONF-8211146—Vol.1).

From Symposium on stationary combustion NO/sub x/ control; Dallas, TX, USA (1 Nov 1982).

Acid deposition is a complex phenomenon which involves the interaction of a variety of atmospheric processes. These include meteorological processes which contribute to transport, dry deposition, and wet scavenging as well as chemical transformation processes which predominantly produce the acidic substances from precursor emissions such as NO/sub x/ and SO_2 and also effect the processes of dry deposition and wet scavenging. A review of these atmospheric processes and discussion on the outstanding issues which remain to be resolved are presented. In addition, a review of present generation acid deposition simulation models is presented with a discussion of their shortcomings and the direction future generations of models are likely to take. Finally, a brief overview of the Atmospheric Processes Program underway as part of the Federal Interagency Task - National Acid Precipitation Assessment Plan is also presented.

34228 **(LA—10086-MS) LIDAR measurements in the vicinity of the Kingston Steam Plant, Tennessee, during March 18-22, 1981.** Horak, H.G.; Whitaker, R.W.; Karl, R.R.; Argo, H.V. (Los Alamos National Lab., NM (USA)). Apr 1984. Contract W-7405-ENG-36. 96p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013876.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

During March 18 through March 22, 1981, personnel of the Los Alamos Earth and Space Sciences Division performed LIDAR measurements in the vicinity of the Kingston Steam Power Plant in Tennessee in order to determine the spatial distribution of aerosols in the ambient atmosphere and the optical thicknesses of the plumes emerging from the two 305-m-tall plant stacks. Simultaneously, particulate concentrations were being measured at the ground during the course of the Harvard Air Pollution/Lung Study Program; this program concerned the exposure to air particulates experienced by selected individuals and groups who lived in the towns of Kingston and Harriman. It was suggested that the Harvard data may correlate with the aerosols emitted by the stacks. The LIDAR observations were made during a period of westerly air-flow aloft with generally high visibility (30 to 40 km). The data were recorded on magnetic tapes and analyzed at Los Alamos. The LIDAR determined ambient extinction coefficients near the ground rarely exceeded 0.15 km^{-1} except on March 22 when overcast and rainy skies prevailed. Slant path data for the ambient air occasionally showed an increasing aerosol concentration with height, and/or a changing aerosol phase-function with height. Interesting plume-like or layered features, sometimes of short duration, were occasionally detected at low elevations. The structures of some cloud layers were measured, and the heights of their bases and tops determined. The optical thicknesses ofthe stack plumes were generally less than 0.09 with mean extinction coefficients $\sim$ 0.2 to 0.4 km^{-1}; the plumes did not approach the ground. Therefore, little correlation could be found between the stack effluent and the Harvard Lung Program measured aerosol concentrations at the ground. 1 reference, 36 figures, 5 tables.

34229 **(LA—10095-MS) Copper smelters and atmospheric visibility in national parks and wilderness areas in the southwest.** Nochumson, D.H.; Williams, M.D. (Los Alamos National Lab., NM (USA)). May 1984. Contract W-7405-ENG-36. 95p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013856.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report presents the results of a study that has compared two strategies for controlling sulfur oxides emitted from 11 southwestern copper smelters in terms of their effect on atmospheric visibility at 14 southwestern national parks and wilderness areas. The two alternative control strategies are supplementary control systems and continuous emission controls. The SO/sub x/ emissions for the CEC alternative are one-third those for SCS. The results from seasonal and episodic analyses are presented in this report. Statistical analyses were also performed on aerosol and visibility measurement data from before and during the summer 1980 copper smelter strike. The regional transport models used for predicting ambient sulfate concentrations were calibrated using historical data. According to model predictions, the CEC alternative would significantly improve visibility at five or six of the eight areas for two seasons of the year. The smelters were found to be a significant contributor to visibility reduction in seven out of eight of the areas studied. The strike period's SO_4 concentrations were substantially reduced from levels during the nonstrike period at almost all of the aerosol monitoring sites studied whereas visibilities had a much less than expected improvement. 39 references, 29 figures, 46 tables.

34230 **(LBL—16659) Control of respirable particles and radon progeny with portable air cleaners.** Offermann, F.J.; Sextro, R.G.; Fisk, W.J.; Nazaroff, W.W.; Nero, A.V.; Revzan, K.L.; Yater, J. (Lawrence Berkeley Lab., CA (USA)). Feb 1984. Contract AC03-76SF00098. 98p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE84013878.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

Eleven portable air cleaning devices have been evaluated for control of indoor concentrations of respirable particles and radon progeny. Following injection of cigarette smoke and radon in a room-size chamber, decay rates for particles and radon progeny concentrations were measured with and without air cleaner operation. Particle concentrations were obtained for total number concentration and for number concentration by particle size. In tests with no air cleaner the natural decay rate for cigarette smoke was observed to be 0.2 hr^{-1}. Air cleaning rates for particles were found to be negligible for several small panel-filters, a residential ion-generator, and a pair of mixing fans. The electrostatic precipitators and extended surface filters tested had significant particle removal rates, and a HEPA-type filter was the most efficient air cleaner. The evaluation of radon progeny control produced similar results; the air cleaners which were effective in removing particles were also effective in removing radon progeny. At low particle concentrations plateout of the unattached radon progeny is an important removal mechanism. Based on data from these tests, the plateout rate for unattached progeny was found to be 15 hr^{-1}. The unattached fraction and the overall removal rate due to deposition of attached and unattached nuclides have been estimated for each radon decay product as a function of particle concentration. While air cleaning can be effective in reducing total radon progeny, concentrations of unattached radon progeny can increase with increasing air cleaning. 39 references, 26 figures, 9 tables.

34231 **(LBL—17274) Measurement of sulfur dioxide in the post-combustion environment.** Lucas, D.; Morrow, M.D.; Brown, N.J. (Lawrence Berkeley Lab., CA (USA)). Jan 1984. Contract AC03-76SF00098. 24p. (CONF-840801—5). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84006755.

From 20. international symposium on combustion; Ann Arbor, MI, USA (12 Aug 1984).

Tunable Atomic Line Molecular Spectroscopy (TALMS) has been used to measure sulfur dioxide in the post flame region of an atmospheric pressure stoichiometric methane/air flame. The technique is sensitive and highly selective and thus is useful for research and commercial applications. Response is linear to 20,000 ppM in a 7 cm path length, with a limit of detection of $\sim$ 2000 ppM at 1500 K and $\sim$ 40 ppM at 300 K. Ultraviolet absorption spectra of SO_2 were recorded in the 205 to 220 nm range at various temperatures, and reveal significant broadening due to rotational redistribution at the higher temperatures, and no interference from other combustion products. TALMS signal dependence on magnetic field strength confirms that the same transition is observed in the flame as at room temperature. Fluorescent quenching of SO_2 by combustion products were measured in a Thermo Electron model 40 analyzer. Plots of S_0/S-1 are linear and yield relative quenching coefficients which increase in the order: Ar, CO_2, O_2, H_2, CH_4, CO, and C_6H_6. Significant quenching corrections are needed to accurately determine SO_2 concentrations in combustion mixtures, especially for the case of rich combustion, where large concentrations of CO, unburned hydrocarbons, and aromatic soot precursors may be present. 28 references, 6 figures, 1 table.

34232 (MST-LUFT-A—73) Studies of aerosols in the Greenland atmosphere. SAGA I: results 1979-1980. A base report. Heidam, N.Z. (Miljoestyrelsen, Roskilde (Denmark). Luftforureningslab.). Oct 1983. 169p. NTIS (US Sales Only), PC A08/MF A01. Order Number DE84751004.

Portions are illegible in microfiche products.

The SAGA-project - Studies of aerosol in the Greenland Atmosphere - was started in August 1979 in order to obtain a comprehensive description of the level and composition of the Arctic aerosol and their seasonal variations. In this report results from the first year of operation are described. Filter samples of the aerosol have been collected at 5 stations, Viz. at Thule in northwest and Nord in northeast Greenland, at Godhavn on the west coast and Kap Tobin on the east coast and at Prins Christianssund at the southern tip of Greenland. The latter station has only been in operation for limited periods. The measuring stations are running continously and collect two samples each week. The filters are subjected to PIXE-analysis which yields concentrations of the elements detected in the aerosol. Usually 15-25 elements are detected. In order to elucidate the causes for the variations and intercorrelations of the many aerosol constitutens simplifying models of the aerosol have been constructed. The models show that the atmospheric aerosol in Greenland can be considered to be composed of 4-5 different components. The naturally occurring crustal component and the anthropogenically derived combustion component, which has a pronounced winter maximum, seem to be of very distant origin. The crustal component in summer appears to be of indigeneous origin while the combustion component is absent. However, the naturally occurring marine component is linked to mesoscale transport mechanisms inasmuch as it appears to be controlled by the oceanic ice cover in the Greenland waters. The metallic component is controlled by atmospheric transport porcesses on a large scale. However the nature of this transport is not known.

34233 (NUREG/CR—3773) Variation of planetary boundary layer dispersion properties with height in unstable conditions. Hicks, B.B. (National Oceanic and Atmospheric Administration, Oak Ridge, TN (USA). Air Resources Labs.). May 1984. 51p. NTIS, PC A04/MF A01 - GPO $4.00. Order Number DE84901286.

Portions are illegible in microfiche products.

Recent developments in surface boundary layer and planetary boundary layer meteorology are combined to evaluate the height dependence of the dispersion parameters σ/sub z/ and σ/sub y/ of the familiar Gaussian plume relationships. Recommendations are based on analyses of surface boundary layer data, such as are collected at industrial sites under existing NRC guidelines. 25 references, 9 figures.

34234 (ORNL/CDIC—1/R1) Inventory of numeric data for carbon dioxide research. Revision 1. Watts, J.A. (Oak Ridge National Lab., TN (USA)). Jun 1984. Contract AC05-84OR21400. 270p. NTIS, PC A12/MF A01; GPO Dep. Order Number DE84013683.

This report is an update of the 1983 inventory documenting the results of a survey to determine the status and availability of numeric data for application in carbon dioxide research and modeling studies. The inventory focuses on the identification, status, and accessibility of data pertenent to the carbon dioxide research programs of the US Department of Energy Carbon Dioxide Research Division. The inventory process will continue to evolve as research programs proceed and new data are collected or identified as being needed for specific research efforts. This report is one mechanism of promoting contributor/user interaction. It is hoped that the report will give direction to secondary users of the data by identifying the primary collectors, the types of data collected and availability, and how the data have been applied and/or interpreted. It serves as a guide for the Carbon Dioxide Information Center (CDIC) in the acquisition, organization, documentation, and evaluation of data to meet research needs. Descriptions of newly identified datasets and corrections to existing data descriptions will be issued periodically.

34235 (PB—84-121375) National emissions report, 1981: national emissions data system of the aerometric and emissions reporting system. (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Jan 1984. 1647p. (EPA—450/4-83-022). NTIS MF A01.

See also PB82-106527.

This report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, volatile organic compounds, and carbon monoxide. Source emissions data are reported to the U.S. Environmental Protection Agency under provisions of Section 110 of the Clean Air Act, as amended in 1977, and of EPA Regulations, Title 40. Code of Federal Regulations, Part 51.321. Summary data are presented for the nation as a whole, for individual states, for intrastate and individual interstate portions of Air Quality Control Regions, and for total interstate Air Quality Control Regions.

34236 (PB—84-145101) Evaluation of the disposal of flue gas cleaning wastes in coal mines and at sea: refined assessment. Final report Jun 75-Sep 83. Lunt, R.R.; Cooper, C.B.; Reyman, A.S.; Johnson, S.L.; Bodek, I. (Little (Arthur D.), Inc., Cambridge, MA (USA)). Jan 1984. 224p. NTIS, PC A10/MF A01.

See also PB-269270.

The report gives a refined assessment of the feasibility of disposing of flue gas cleaning (FGC) wastes in coal mines and at sea. Its focus is on specific impact areas identified in an earlier assessment. These areas were further investigated through laboratory studies as well as an additional review of published information. For FGC waste disposal in coal mines, the issues addressed are: (1) physical stability of FGC waste deposited in surface mines; (2) effects of freezing on waste dewatering/drainage; (3) fugitive emissions from handling and disposal; (4) leaching of total oxidizable sulfur (TOS) from sulfite-rich wastes; (5) release of gases from waste deposits; and (6) corrosion potential for concrete bulkheads used for containment in underground mines. For disposal of FGC wastes at sea, the impact issues studied were: (1) the physical fate in the water column during descent from conventional barge disposal; (2) benthic transport and sedimentation of dumped FGC waste; and (3) depletion of oxygen due to dissolution of TOS from sulfite-rich wastes. These issues represent potential environmental impacts which may require evaluation for specific disposal conditions. In general, existing controls can mitigate such impacts; e.g., modification of waste properties and waste placement methods.

34237 (PB—84-151984) Comprehensive assessment of the specific compounds present in combustion processes. Volume 3. National survey of organic emissions from coal fired utility boiler plants. Final report, task 52. Haile, C.L.; Stanley, J.S.; Walker, T.; Cobb, G.R.; Boomer, B.A. (Midwest Research Inst., Kansas City, MO (USA)). Sep 1983. 236p. NTIS, PC A11/MF A01.

See also PB84-140870.

This study was conducted as a part of a nationwide survey to determine organic emissions from major stationary combustion sources. The principal compounds of interest are polynuclear aromatic hydrocarbons (PAHs) and chlorinated aromatic compounds, including polychlorinated biphenyls (PCBs), polychlorinated dibenzo-p-dioxins (PCDDs), and polychlorinated dibenzofurans (PCDFs). This report describes the methods and results of sampling and analysis activities at the seven plants constituting the nationwide survey of coal fired utility boiler plants.

34238 (PB—84-155373) Performance test results and comparative data for designated equilvalent methods for sulfur dioxide. Michie, R.M. Jr.; Sexton, F.W.; McElroy, F.F.; Thompson, V.L. (Research Triangle Inst., Research Triangle Park, NC (USA)). Jan 1984. 140p. NTIS, PC A07/MF A01.

The U.S. Environmental Protection Agency designates specific ambient monitoring methods and analyzers as reference or equivalent methods acceptable for use in certain required monitoring. Such designation is based on test of the performance of the analyzer model by the manufacturer (or other applicant) prior to designation. After designation, EPA carries out further tests of the an-

alyzer, including performance tests as well as comparative tests to evaluate the performance, reliability, and operational peculiarities of the analyzer with respect to other analyzers monitoring the same pollutant. This report summarizes both the manufacturer's predesignation test results and the available EPA postdesignation test results for currently designated sulfur dioxide analyzers. Manufacturer's predesignation test results are presented for thirteen analyzers, and all test results met or exceeded the specifications. EPA postdesignation performance test results are presented for ten analyzers, and similarly, all test results met or exceeded the specifications. EPA postdesignation comparative test results are presented for eight analyzers, with the results indicating that the analyzers tested were generally stable and reliable and demonstrated a high degree of comparability.

34239 **(PB—84-161439) EPA (Environmental Protection Agency) Complex Terrain Model Development description of a computer data base from small hill impaction study No. 1, Cinder Cone Butte, Idaho. Final report.** Truppi, L.E.; Holzworth, G.C. (Energy and Environmental Research Corp., Irvine, CA (USA)). Feb 1984. 117p. NTIS, PC A06/MF A01.

See also PB83-220020.

As part of the U.S. Environmental Protection Agency's effort to develop and demonstrate a reliable model of atmospheric dispersion for pollutant emissions in irregular mountainous terrain, the Complex Terrain Model Development Program was initiated. The first phase, a comprehensive tracer field study, was carried out on Cinder Cone Butte, Idaho, during the autumn of 1980. Eighteen quantitative tracer experiments were conducted, each lasting 8 hr at night or early morning. The main tracer gas was sulfur hexafluoride; a second tracer, Freon 13B1 was used in ten of the eighteen experiments. Averaged meteorological data were recorded from six towers near and on the slopes of the hill. Data consisted of direct and derived measures of temperature, wind, turbulence, solar and net radiation, and nephelometer coefficient of scattering. Hourly wind profiles were obtained from pilot balloon observations; tethersonde observations recorded profiles of wind and temperature. Tracer gas concentrations were detected by a network of approximately 100 samplers located on the slopes of the hill. The system used to collect the data, the operation procedures used to run the system, and its performance record are described. Tables of tracer gas release data have been included to assist in any modeling effort. All meteorological and tracer concentration data have been edited and recorded on magnetic tape and are now available, upon request, at the National Computer Center, R.T.P., NC, either as copies or by interactive computer access.

34240 **(PB—84-162601) Determination of cloud parameters for Neros II from digital satellite data. Final report 30 Sep 81-30 Mar 83.** Behunek, J.L.; Vonder Haar, T.H.; Laybe, P. (Colorado State Univ., Fort Collins (USA). Dept. of Atmospheric Science). Mar 1984. 50p. NTIS, PC A03/MF A01.

As part of the input for their regional-scale photochemical oxidant model of air pollution, known as the Regional Oxidant Model, requires statistical descriptions of total cloud amount, cumulus cloud amount, and cumulus cloud top height for certain regions and dates. These statistics are used to parameterize photochemical reactions, and to diagnose vertical transport of pollutants. The purpose of this work was to derive these statistics from digital satellite data. The first stage of the work was to apply a human-computer interactive technique to satellite data to distinguish cumulus clouds from clouds of other types, and to produce the cloud amount statistics for cells within specified grids. Next, the interactive technique was applied to the infrared data to calculate the mean cloud top temperature for each cell. Those mean temperatures were then converted to heights by referring to objectively analyzed temperature versus height information derived from radiosonde data. A frequency distribution of cumulus cloud top heights was also produced for some cases.

34241 **(PB—84-173095) Acid deposition: atmospheric processes in eastern North America, a review of current scientific understanding.** (National Academy of Sciences - National Research Council, Washington, DC (USA)). 1983. 381p. NTIS, PC A17/MF A01.

Sponsored in part by Carnegie Corp. of New York, Charles E. Culpepper Foundation, Inc., New York, Andrew W. Mellon Foundation, New York and Alfred P. Sloan Foundation, New York. Library of Congress catalog card No. 83-61851.

There is no observational evidence of a strong nonlinearity in the relationship between annual average total emissions and total deposition of sulfur in eastern North America. The finding is supported by theoretical calculations using the best available laboratory measurements of photochemical rate parameters. Currently available models of long-range atmospheric transport and transformation are not sufficiently developed to assess relationships between emissions from specific sources and deposition at specific receptor sites with high reliability.

34242 **(PB—84-179886) Fundamental study of sulfate aerosol formation, condensation, and growth. Final report Oct 80-Sep 82.** Yung, S.C.; Rangaraj, C.N.; Hancock, B.L.; Ugale, D.; Calvert, S. (Air Pollution Technology, Inc., San Diego, CA (USA)). Mar 1984. 187p. NTIS, PC A09/MF A01.

The report gives results of a study of the formation and growth of sulfate particles. Existing theoretical models on acid particle formation and growth were reviewed and evaluated. The formation and growth of sulfate particles during slow cooling, rapid cooling, and dilution cooling of flue gas were experimentally determined and compared with theories. The experimental results show that the temperature at which the self-nucleation of sulfuric acid occurs is lower than the acid dew point temperature. Thus, if the flue gas is slowly cooled to between dew point and nucleation temperatures, it is possible to force the sulfuric acid to condense out on surfaces, rather than form fine particles. The theories, experimental methods, and results are described.

34243 **(PB—84-184233) Buffer additives for lime/limestone slurry scrubbing synthesis, mass transfer, and degradation. Final report Oct 80-Oct 83.** Rochelle, G.T.; Smith, R.J.; Weems, W.T.; Hsiang, M.W.; Lee, T. (Texas Univ., Austin (USA). Dept. of Chemical Engineering). Apr 1984. 287p. NTIS, PC A13/MF A01.

The report gives results of experimental studies, performed with buffer additives, useful for flue gas desulfurization by lime/limestone slurry scrubbing. The most attractive acids for further testing are adipic, mixtures of waste dibasic organic, sulfosuccinic, hydroxypropionic, and hydroxyacetic acids.

34244 **(PNL-SA—12117) Modeling wet-removal processes in the atmosphere.** Laulainen, N.S.; Easter, R.C.; Hales, J.M. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1984. Contract AC06-76RL01830. 11p. (CONF-840374—4). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013261.

From APCA specialty meeting on environmental impact of natural emissions; Research Triangle Park, NC, USA (7 Mar 1984).

This paper gives a status report and overview of the PLUVIUS series of interpretive scavenging models. Intended primarily for the evaluation of precipitation-scavenging mechanism from field-study data, this model series is somewhat unique in that its member codes simulate the phase-transformation processes associated with precipitation formation. This allows both gaseous- and aqueous-phase chemical mechanisms to be simulated in a direct manner, thus avoiding some of the nonspecific parameterizations typical of earlier scavenging models. The first working PLUVIUS code was formulated at Stockholm University in 1979. Since that time a number of improved versions have evolved, which have been applied both for data interpretation and field-study design. At present two such versions have been documented in user-manual form for extended scientific applications. 5 references, 4 figures, 1 table.

34245 **(STF—21A83056) Characterization of effluents from coal and oil heating. 3. Oil heated installations.** Vassbotn, T.; Hagen, R.I.; Tellugen, S.; Wiig, P.O. (Trondheim Univ. (Norway). Vassdrags- og Havnelaboratoriet). Mar 1983. 24p. (In Norwegian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84751028.

Portions are illegible in microfiche products.

Measurements and analyses of effluents were carried out to determine the amount of gas, and SO_2 concentration. Content of polycyclic aromatic hydrocarbons (PAH) in dust and in the exhaust gases. Particle size distribution and heavy metal concentration (i.e., nickel and vanadium), were determined in three dust fractions in the oil and correlated with operational data. Two burners were studied, one heated by heavy oil and the other by light oil. The amounts of dust and SO_2 in the exhaust gases were small. The dust was divided in a "light" and a "dark" type. The darker type consisted of larger particles. The medium size particles had the highest heavy metal concentration. Nickel and vanadium seem to be located in a certain type of dust. These tendencies were clearer for the heavy oil boiler. The amount of PAH in the dust is smaller than for coal heated boilers. 1 drawing, 13 tables.

34246 **(SVC—83-38) Cr(VI) and other metallic mutagens in fly ash and welding fumes.** Stern, R.M.; Thomsen, E.; Furst, A. (Svejsecentralen, Glostrup (Denmark)). 1983. 27p. (CONF-8309223—1). Svejsecentralen, Glostrup, Denmark. Order Number TI84751001.

From 1. international workshop on carcinogenic and/or mutagenic metals; Geneva, Switzerland (11 Sep 1983).

Particulate samples taken from both the indoor (working) and outdoor (community) environments contain a wide range of metallic trace elements most of which are mutagenic in at least one of the short term tests for genotoxicity currently in use. Because of the demonstrated presence of a short lived biologically active species (Cr(VI)) and because the uncertainty with which the results of the screening of metallic compounds in short term tests can be interpreted in terms of human risk, great care must be taken to assure the appropriate collection and storage as well as the chemical and biological assay of such material. The sensitivity of the results for fly ash and welding fumes to variations in these protocols is demonstrated and discussed.

34247 **Role of cloud dynamics in redistributing pollutants and the implications for scavenging studies.** Isaac, G.A.; Strapp, J.W.; Wiebe, H.A.; Leaitch, W.R.; Kerr, J.B.; Anlauf, K.G.; Summers, P.W.; Macpherson, J.I. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

There are few field measurements of cloud dynamics-pollutant interactions. This paper describes measurements illustrating the role of clouds in pollution transport. Some discussion of the importance of cloud dynamics is provided. 5 references, 9 figures, 1 table. (MDF)

34248 **Studies of the gas- and aqueous-phase composition of stratiform clouds.** Daum, P.H.; Schwartz, S.E.; Newman, L. (Brookhaven National Lab., Upton, NY). pp 31-52 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). Contract AC02-76CH00016.TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The chemical composition of liquid water and interstitial trace gases and aerosols was measured in stratiform clouds. The cloudwater pH was between 3 and 4 with much of the acidity due to SO_4. Cloudwater was significantly more acidic than clear-air aerosol. Values of the relative acidity of aerosols ranged from 0.1 to 0.6, while cloudwater ranged between 0.6 and 1.1. The acidification process, SO_2 or NO/sub x/ dissolution, was important. Composition of cloudwater samples was due to cloud liquid water content and the concentrations of trace gases in the interstitial cloud air. Interstitial aerosol components were low in comparison to concentrations in cloud water. Composition of interstitial aerosol exhibited a lower acidity than cloudwater. The concentrations of interstitial trace gases were as follows: insoluble gases, NO/sub x/ and O_3 were similar to clean air; soluble gases, HNO_3 and NH_3 were not detected; and moderately soluble gases such as SO_2 were found in some samples. Cloudwater measurements of H_2O_2 suggest that it is present in sufficient amounts to cause rapid conversion of SO_2 to sulfuric acid and may be a major pathway for the production of acids deposited in precipitation. 15 references, 5 figures, 3 tables.

34249 **Measurements of scavenging and transformation of aerosol inside cumulus.** Leaitch, W.R.; Strapp, J.W.; Wiebe, H.A.; Isaac, G.A. (Atmospheric Environment Service, Downsview, Ontario). pp 53-70 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The results of two aircraft studies (fall, 1981 and summer, 1982) designed to provide the beginnings of a data base for the examination of aerosol and gas interactions with clouds are presented. Specifically the behaviour of sulfate in non-precipitating cumulus type clouds and in the surrounding air is investigated with some emphasis placed on the cloud and aerosol properties. Also discussed are problems which may lead to erroneous interpretations when the collected information is insufficient. 11 references, 5 figures, 2 tables.

34250 **Preliminary measurements of the size distribution of cloud interstitial aerosol.** Radke, L.F. (Univ. of Washington, Seattle). pp 71-78 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Preliminary measurements of cloud interstitial aerosol indicate that most of the aerosol number (and much of the aerosol mass) at cloud base is immediately incorporated into cloud water just above cloud base by nucleation scavenging. Thus the rate-limiting, in-cloud scavenging step, is the removal of cloud droplets as precipitation, rather than the inclusion of aerosol into cloud droplets. It is also clear that, for the cases considered, nucleation scavenging bridged the precipitation scavenging gap by rapidly removing aerosol in the 0.01-1 μm size interval. 5 references, 2 figures, 1 table.

34251 **Preliminary measurements on the scavenging of sulfate and nitrate by clouds.** Hegg, D.A.; Hobbs, P.V. (Univ. of Washington, Seattle). pp 79-89 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Preliminary field measurements of the total in-cloud scavenging efficiency for sulfate in cumulus, stratocumulus and stratus suggest that the nucleation scavenging efficiency for sulfate is (63 +- 53)%. Our field measurements also suggest that, unlike sulfate, there is little production of nitrate in cloud droplets and therefore the primary mechanism for the incorporation of nitrates into cloud water is through scavenging of pre-existing nitrates. 21 references, 1 table.

34252 Cloud water chemistry at Whiteface Mountain. Kadlecek, J.; McLaren, S.; Camarota, N.; Mohnen, V.; Wilson, J. (State Univ. of New York, Albany). pp 103-114 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Analyses performed on a few of the events monitored at Whiteface Mountain during the summers of 1980-1982 are discussed. The purpose of the experiment was to monitor the concentrations of the dominant ions throughout the cloudy events. This was done for about 10 events each summer. Samples of cloud water were refrigerated immediately after collection and ion chromatography measurements were made within one day. 5 references, 5 figures, 2 tables.

34253 Dependence of sulphate scavenging ratios on meteorological variables. Barrie, L.; Neustadter, J. (Atmospheric Environment Service, Downsview, Ontario). pp 203-216 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The usefulness of a large data base and statistical analysis techniques in separating a signal representing the relationship between the daily sulfate scavenging ratio (W) and meteorological factors from measurement noise associated with the estimation of W by ratios measured at a point on the ground is illustrated. In eastern Canada, W depends on several variables which, in order of importance are: precipitation amount, location and precipitation type. On the basis of ground level observations no dependence of W on cloud type was apparent. The fact that a substantial fraction of the variance in W remains unexplained by meteorological variables leads to the conclusion that the accuracy of a sulfate deposition estimate based on the equation given will improve as averaging time increases. Consequently, predictions of seasonal or annual sulfate deposition will be more accurate than those for single events. A comparison of sulfate and particle scavenging ratios to deduce the mean contribution of SO_2 oxidation to sulfate wet deposition (70 +- 30%) illustrates the value of routine ground level measurements in providing insight into atmospheric transformation processes. 12 references, 2 figures, 2 tables.

34254 Scavenging ratios for exceptional wet $SO_4$2p episodes in eastern North America from three event networks. Niemann, B.L. (Univ. of Illinois, Urbana). pp 217-228 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

This paper analyzes the scavenging ratios for exceptional wet SO_4 episodes from three event networks in eastern North America. Data from APN, EPRI-UAPSP and MAP3S networks were used. Data show considerable temporal and spatial variability from site-to-site and from year-to-year. The scavenging ratios for exceptional episodes appear to be independent of precipitation rate or amount, a result which has been found previously for the high precipitation rates usually associated with the exceptional episodes. 8 references, 4 figures.

34255 Correlation of intrastorm sequential precipitation chemistry with storm meteorology. Wilson, J.; Graham, R.; Robertson, J. (Science Research Lab., West Point, NY). pp 229-238 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Sequential sampling of increments of 0.01 inch has been shown to be an effective method to examine detailed variations in precipitation chemistry for a variety of meteorological conditions. Resolution on this scale allows for accurate correlation of precipitation chemistry with storm types, accompanying meteorological data, and trajectory analysis. Often even event-only sampling cannot be accurately correlated with meteorological data due to a complex series of weather phenomenon. The described automated sampler provides a reliable method for collection of these samples. The detailed chemical data set obtained through sequential sampling may also be utilized to develop integrated values for the entire event. Total cumulative deposition is only one example of this technique. 4 references, 6 figures, 1 table.

34256 Tracking the source regions for wet deposition in the Netherlands by a combination of cluster analysis and meteorological interpretation. Slanina, J.; Asman, W.A.H. (Netherlands Energy Research Foundation, Petten; Inst. for Meteorology and Oceanography, Utrecht, Netherlands). pp 239-248 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Statistical techniques have been used to classify precipitation sampling periods on the basis of chemical composition. Cluster analysis (centroid method) using concentrations of 12 or 9 compounds per sampling period had no effect on groups. The analysis divided the data into 2 source groups, continental origin and marine origin. The contribution of HNO_3 and H_2SO_4 to the acidity of rain was investigated using multiple regression analysis on the data from each group. In many cases the role of HNO_3 was more important. 5 references, 5 figures, 3 tables.

34257 Scavenging of nitric acid vapor by snow. Huebert, B.J.; Fehsenfeld, F.C.; Norton, R.B.; Albritton, D. (Colorado Coll., Colorado Springs; Aeronomy Lab., NOAA/ERL, Boulder, CO). pp 293-302 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Nitric acid vapor is rapidly scavenged from the atmosphere by falling snow. It appears that this process occurs with a rate constant about five times as fast as the incorporation of aerosol NO_3^- or SO_4^{2-} into snow. Table 2 lists our best estimates of both scavenging coefficients and washout ratios, although we feel that the nitric acid scavenging coefficient should be treated as a lower limit to the true value. We also found that nitric acid contributes about one-half of the acidity deposited in snowfall at this mountain site. 17 references, 2 tables.

34258 Scavenging measurements near large point sources: a review and evaluation. Dana, M.T.; Patrinos, A.A.N. (Pacific Northwest Labs., Richland, WA; Brookhaven National Lab., Upton, NY). pp 335-348 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). Contract AC06-76RL01830.TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

This review has been confined to open literature reports and recent work on the subject of large point-source scavenging measurements. From this body of work, it appears that the available experimental results are limited to a few specific sources and deal in detail with few precipitation events. Observed concentrations of the major scavenged species vary considerably, presumably as a result of variations in meteorological and background conditions and source characteristics, but often insufficient detail is given (or measured) to evaluate useful scavenging parameters. The results from low background studies indicate that SO_2 scavenging is a significant contributor to the rather low sulfur deposition impact close to the source, but it is not clear that these results can be applied to high-background conditions, because of the potential for modified SO_2-sulfate reaction rates, and the lack of sampling to great distances. Assistance in resolving questions of the impact of within-region sources on regional precipitation chemistry may be provided by further study of the original data of past efforts, particularly the recent Sudbury studies. Otherwise, new field efforts in high background areas, employing modern analytical and plume-sensing techniques, and sampling to greater distances, are required. 20 references, 3 tables.

34259 Estimation of wet deposition from a plume of a powerplant and of the corresponding background concentration. Slanina, J.; Romer, F.G.; Asman, W.A.H. (Netherlands Energy Research Foundation, Petten; KEMA Labs. Environmental Dept., Arnhem, Netherlands; Inst. for Meteorology and Oceanography, Utrecht, Netherlands). pp 349-356 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Wet deposition of plume constituents were measured and multiple regression analysis used to achieve background correction and data validation. Samples were collected using arcs containing 30 samples located 5 and 15 km from an oil fired power station near Lelystad, The Netherlands. All compounds washed out with the same efficiency. Using this data, background concentrations of sulfate were calculated and compared to measured concentrations of background sulfate. The resulting ratios (between 0.9 and 1.1) were used to validate the data and to calculate the contribution of background sulfate to sulfate deposition under the plume. 5 references, 4 figures, 2 tables.

34260 Scavenging rates of sulfur and trace metals from a smelter plume. Lusis, M.A.; Chan, W.H.; Tang, A.J.S.; Johnson, N.D. (Ontario Ministry of the Environment, Toronto; Ontario Research Foundation, Mississauga). pp 369-382 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The scavenging rates of sulfur and trace metals from the emissions of the INCO smelter at Sudbury, Ontario, have been studied during a number of storms. In spite of a considerable difference in the particle size distributions of the trace metals, comparable scavenging coefficients were observed. This is attributed largely to in-cloud modifications of the emitted particulate matter. The scavenging rate of sulfur from the plume was more than an order-of-magnitude lower than that for the trace metals. This results from the fact that, within the acidic environment of the plumes studied here, little SO_2 is dissolved in rain- or cloud-drops, and removed by precipitation. Most of the sulfur is thought to be removed as sulfate at the distances from the source studied here. During the summer months, secondary sulfate formation may play a more important role. No definite influence of meteorological factors, such as precipitation type or rate, could be discerned in the present data set. It should be noted that most of the storms studied here were frontal storms as the present approach is not feasible for convective storms. The scavenging coefficients determined in this study should be of value for mathematical modelling applications, especially for releases from elevated sources during frontal storms. 16 references, 2 figures, 2 tables.

34261 Precipitation scavenging and dry deposition of pollutants from the inco nickel smelter in sudbury. Chan, W.H.; Ro, C.U.; Vet, R.J.; Tang, A.J.S.; Lusis, M.A. (Ontario Ministry of the Environment, Toronto, Ontario; Petro-Canada, Alberta; Concord Scientific Corp., Downsview, Ontario). pp 383-394 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Precipitation and air monitoring data collected from mid-1978 to mid-1980 were used to evaluate the fate of INCO emissions. It was found that INCO, on average, contributed less than 20% of the Sudbury Basin wet deposition of sulfur, acidity and a number of trace metals, with the exception of copper and nickel, where the contribution was about 70%. It was estimated that of sulfur dioxide, and substances predominantly in submicron particles (sulfate, lead, zinc and cadmium) less than 5% of the emissions were dry deposited within 40 km of the INCO source, whereas for coarse particles (containing most of the iron, nickel and copper) 50% or more of the emissions were deposited within this distance. The smelter contribution to the total dry deposition within 40 km of the source was the greatest for sulfur and nickel. The smelter contribution to the other metals examined (iron, lead, zinc, cadmium, aluminum) was generally less than 20% of the total dry deposition. 14 references, 4 tables.

34262 Distribution of polycyclic aromatic hydrocarbons in precipitation. Georgii, H.W.; Schmitt, G. (Univ. of Frankfurt, Germany). pp 395-402 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Rain samples collected from January to June 1981 exhibited seasonal variation in PAH concentration with a winter maximum and a summer minimum. The same variation was found in aerosol-bound PAH. A strong correlation between PAH-concentration and atmospheric temperature was observed. There is also a temporal trend during individual events as the PAH concentration decreases with time, the unsoluble fraction showing a rapid drop during the initial phase while the soluble fraction remains steady. Snowfall events were used to study the regional distribution of PAH in precipitation. The highest concentrations occurred in urban areas decreasing toward suburban and rural environments. In addition, the insoluble and soluble fractions are equal in suburban sites while the insoluble fraction exceeds the soluble in the city. A comparison between atmospheric aerosol particles and precipitation samples shows that the precipitation samples are enriched in species of low molecular weight. 7 references, 3 figures, 1 table.

34263 Organic compounds in Los Angeles and Portland rain: identities, concentrations, and operative scavenging mechanisms. Pankow, J.F.; Isabelle, L.M.; Asher, W.E.; Kristensen, T.J.; Peterson, M.E. (Oregon Graduate Center, Beaverton). pp 403-416 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The rain sampling/analysis methodology employed attempts to distinguish between the dissolved and scavenged particle-associated levels of a variety of organic compounds. For many of the PAH compounds studied, the total (dissolved and filterable) concentration was of the order of 1 to 200 ng/L. Thus, even though the heavier PAH compounds will tend to be scavenged more effectively (they are associated with the aerosol particles to a greater extent), it would seem that their decreasing contribution to the total PAH levels provides a counterbalance leading to a more evenly distributed total flux rate. Concentrations determined for the Portland storm event indicate that the dissolved flux rates can be: relatively high for many of these compounds; and possibly underestimated if calculated on the basis of near ground-level atmospheric gas concentrations. 20 references, 1 figure, 5 tables.

34264 Effects of organic surface films on the scavenging of atmospheric gases by raindrops and aerosol particles. Graedel, T.E.; Gill, P.S.; Weschler, C.J. (Bell Labs., Holmdel, NJ). pp 417-430 of Precipitation scavenging, dry deposition, and resuspension. Volume 1. Precipitation scavenging. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. (eds.). New York, NY; Elsevier Science Publishing Company, Inc. (1983). (CONF-821136—Vol.1). TI84002447

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A review of information pertaining to the presence of organic films on atmospheric water droplets suggests that such films are common on atmospheric aerosol particles and may sometimes be present on raindrops as well. Some consequences of the presence of organic films were investigated by kinetic calculations of the chemistry of film-coated and uncoated raindrops. Species whose concentrations in the drops are controlled by incorporation from the gas phase are markedly affected if an organic film is present. Those which are present within cloudwater prior to the formation of raindrops or which are chemically generated within raindrops are influenced to a much smaller degree by the presence of an organic film. Organic films on atmospheric water droplets therefore do not have the potential to shut down all chemistry with droplets, but only specific aspects of that chemistry. 13 references, 4 figures, 1 table.

34265 Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). 725p. (CONF-821136—Vol.2). Elsevier Science Publishing Co., Inc., 52 Vanderbilt Avenue, New York, NY 10017. Order Number TI84002448.

Volume 2 of these proceedings contains papers on dry deposition and resuspension of airborne pollutants. Items within the scope of EDB have been entered separately into the data base. (ACR)

34266 Deposition and resuspension. Chamberlain, A.C. (AERE, Harwell, England). pp 731-751 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The deposition, resuspension and washout of gases and particles were discussed. Specific areas presented include: an historical background; transport by molecular and Brownian diffusion to surfaces; deposition of particles in the 0.2 to 2.0 μm size range and the 2.0 to 30.0 μm size range; deposition of polydisperse particles in the field; and resuspension. 108 references, 6 figures.

34267 Dry deposition of sulphur dioxide onto grass in rural eastern England (with some comparisons with other forms of sulphur deposition). Davies, T.D.; Mitchell, J.R. (Univ. of East Anglia, Norwich, England). pp 795-806 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The dry deposition of SO_2 over grass, calculated from measurements made over periods of several hours, day and night, during relatively constant atmospheric conditions, for a period June-February is discussed. Results show a reduced resistance of wet grass surfaces to SO_2 deposition. 29 references, 2 figures, 3 tables.

34268 Development of an instrument package for the measurement of dry deposition fluxes by eddy correlation. Edwards, G.C.; Ogram, G.L. (Ontario Hydro Research, Toronto). pp 817-824 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The objective of this research is to develop an instrument package for the measurement of dry deposition fluxes using eddy correlation techniques. The successful application of the eddy correlation method requires simultaneous measurement of gas concentration and vertical air motion. A significant problem is the measurement of trace gas concentration fluctuations with sufficient sensitivity and time response. The central aspect of the work will be the development and evaluation of a tunable diode laser absorption spectrometer (TDLAS) system to make fast response (~ 10 Hz), high sensitivity, (<1 ppB) measurements of the concentrations of various gases of interest (e.g., NO, NO_2, NH_3, HNO_3, SO_2, O_3). To complement the laser system a comprehensive micrometeorological instrument package is being assembled. This will include two sonic anemometers, two Lyman-Alpha hygrometers, a 3-component hot film anemometer, micro-bead thermistor sensor, covariance flux meter and data logger/minicomputer. Under ideal circumstances the instrument package will facilitate the measurement of mean turbulent properties at three levels and pollutant flux at one level within the surface layer. Eddy correlation experimental and data analysis techniques will follow those commonly used by previous researchers. 5 references, 3 figures.

34269 Deposition of atmospheric trace constituents onto different natural surfaces. Hoefken, K.D.; Meixner, F.X.; Ehhalt, D.H. (Atmosphaerische Chemie der Kernforschungsanlage, Juelich, Germany). pp 825-835 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

An extended field study of the deposition of airborne constituents upon study of the deposition of airborne constituents upon natural surfaces was studied. A forested area was chosen for two reasons: the forest represents one of the largest natural surfaces; and deposition of trace constituents is considered to be responsible for severe damages to the forest ecosystems themselves. Recent investigations show that vegetation is an important sink for atmospheric trace constituents. 11 references, 7 figures, 2 tables.

34270 Dry deposition of small particles to grass in field conditions. Garland, J.A. (AERE, Harwell, England). pp 849-858 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Recent field measurements of the deposition velocity of small particles have been discussed and some available measurements in the literature are reviewed. The recent measurements are broadly consistent with the variation of deposition velocity with particle size determined in wind tunnel measurements. Deposition of trace elements to filter pads in the field is several times larger than expected; some of the discrepancy may be explained by the characteristics of the sampling method used. Hygroscopic growth of micron-sized particles of substances such as sodium chloride and ammonium sulphate may sometimes explain a doubling of deposition to smooth wet surfaces, but a smaller enhancement of deposition is expected for wet grass surfaces. 25 references, 2 figures, 4 tables.

34271 Dry deposition of trace elements in Olympic National Park. Davidson, C.I.; Goold, W.D.; Wiersma, G.B. (Carnegie-Mellon Univ., Pittsburgh, PA; EG & G Idaho, Inc., Idaho Falls). pp 871-882 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Airborne trace elements in Olympic National Park are derived from a multiplicity of sources, incluing soil dust, sea spray, and anthropogenic emissions. Soil dust appears to be the dominant source for many elements. Some elements characterized by large enrichment factors may be emitted from distant anthropogenic activities and transported over great distances into the Park. Dry deposition fluxes measured on Teflon plates suggest that a small fraction of large airborne particles may be responsible for most of the deposition of each trace element. Material reaching the plates is probably local soil dust and biological debris; particles which have been previously transported into the Park, deposited on soil and vegetation, and later resuspened are also included in the plate deposits. These successive deposition-resuspension processes make it extremely difficult to accurately assess dry deposition of aerosol brought into the Park from other areas. Proper estimates of dry deposition require samplers above the layer of resuspended surface material.

34272 Comparison of surrogate surfaces for dry deposition collection. Dasch, J.M. (General Motors Research Labs., Warren, MI). pp 883-902 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

An initial attempt to compare a variety of surfaces for dry deposition collection is presented. Many of these surfaces were used in the past with the assumption that any surface could collect dry deposition. This study shows that there is a large range of collection efficiencies between surrogate surfaces, as there is for natural surfaces. In general, the surfaces ranged over a factor of 10 from most-to-least effective. The collection efficiency could be explained by surface roughness for particles and surface alkalinity for gases. The metals and sulfate and nitrate showed similar behavior on the various surfaces. The exception is the alkaline glass filter which collected higher nitrate and sulfate than the other surfaces, presumably due to gaseous adsorption. A comparison of material collected on upward and downward surfaces indicated that gravitational settling was the most important removal mechanism. However, gaseous adsorption to the alkaline glass filter accounted for at least 43% of nitrate and 75% of sulfate collection. The polyethylene bucket, collected more material than the Teflon and foils, but less than nylon, quartz, glass, or water. Deposition to the bucket is probably dominated by the gravitational settling of large particles and apparently is not influenced by gaseous deposition. The bucket may grossly underestimate dry deposition. 12 references, 4 figures, 5 tables.

34273 Relationship between dry deposition as measured via collection with a dry bucket vs ambient air concentrations. Johannes, A.H.; Altwicker, E.R. (Rensselaer Polytechnic Inst., Troy, NY). pp 903-912 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Fluxes measured using dryfall buckets are compared with fluxes calculated using measured ambient air concentrations of sulfate and nitrate aerosols. Weekly, monthly and seasonal fluxes were calculated using deposition velocities for one year. 6 references, 6 tables.

34274 Accumulation rates of ionic substances on indoor surfaces. Sinclair, J.D.; Psota-Kelty, L.A.; Munier, G.B. (Bell Telephone Labs., Holmdel, NJ). pp 913-931 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Results of sampling ionic substance deposition from 36 different equipment sites in 18 different cities are summarized. Data are interpreted and compared to available trophospheric data. 14 references, 3 figures, 15 tables.

34275 Experimental study of sulfur deposition to grassland. Hicks, B.B.; Wesely, M.L.; Coulter, R.L.; Hart, R.L.; Durham, J.L.; Speer, R.E.; Stedman, D.H. (NOAA/ATDL, Oak Ridge, TN; Argonne National Lab., IL; Environmental Protection Agency, Research Triangle Park, NC; Univ. of Michigan, Ann Arbor). pp 933-942 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Independent measurements of the deposition of gaseous and particulate sulfur compounds were measured over a field of wheat stubble overgrown with grassy weeds. Sulfate particle and SO_2 flux measurement indicate greater deposition velocities for SO_2 than for particulates. Sulfate aerosol deposition declined at night. Derived daytime deposition velocity for SO_2 deposition was about 0.8 cm/s nighttime deposition declined to 0.2 cm/s. For particulate sulfur, daytime deposition velocities were 0.7 cm/s and at night near 0.2 cm/s. 11 references, 1 figure, 1 table.

34276 Size-resolved measurements by eddy-correlation of the dry deposition velocity of atmospheric aerosol particles. Katen, P.C.; Hubbe, J.M. (Oregon State Univ., Corvallis). pp 953-962 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A portion of the data collected during DIEX was used to make a preliminary evaluation of the usefulness of the PMS ASAS-300A and Royco 225 sensors for making eddy-correlation measurements and to characterize the nature of the deposition process. Fast Fourier transform (FFT) routines are used to determine the spectral characteristics of the signals. A preliminary evaluation of the transport process is discussed and recommendations for establishing sampling criteria are given. 12 references, 7 figures.

34277 **Eddy flux and profile measurements of small-particle dry-deposition velocity at the Boulder Atmospheric Observatory (BAO).** Sievering, H. (National Oceanic and Atmospheric Administration, Boulder, CO). pp 963-978 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Due to possible confounding of earlier results by resuspension of surface particles, a deposition measurement program was designed to obtain v/sub d/ (deposition velocity) during reduced surface source (May-wet soil) and enhanced surface source (August-dry soil) conditions. The eddy correlation technique, using a Knollenberg ASAX probe with a 10 Hz sampling rate and sizing particles in te range $0.09 < D < 2.5$ μm was used in conjunction with the particle sampler elemental profile approach. Thus, a particle size related v/sub d/ and a trace-element-inferred v/sub dH/ may be compared. 10 references, 5 figures, 4 tables.

34278 **Comparison of several techniques for determining dry deposition flux.** Sickles, J.E. II; Bach, W.D.; Spiller, L.L. (Research Triangle Inst., Research Triangle Park, NC; Environmental Protection Agency, Research Triangle Park, NC). pp 979-989 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Simultaneous monthly estimates of dry deposition flux of nitrates and sulfates over a year's duration by several methods were determined and results compared. Direct estimates were made by using actual leaf surfaces ad foliar wash and by using three surrogate surfaces: bucket, petri dish, and cellulose filter. Indirect estimates were made using the concentration determined by sampling and by using the deposition velocity estimated from meteorological measurements. 6 references, 1 figure.

34279 **Estimation of dry deposition velocities of sulfur over Canada and United States east of the Rocky Mountains.** Masse, C.; Voldner, E.C. (Service de l'Environnement Atmospherique, St-Laurent, Montreal; Atmospheric Environment Service, Downsview, Ontario). pp 991-1002 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The monthly average dry deposition velocity fields of sulfur dioxide and sulfate in North America east of the Rocky Mountains were estimated. The estimates are projected on the Canadian Meteorological Centre grid system with a 1/3 grid length (127 km) resolution. The estimates are based on a method developed by Sheih. Extensions to or deviations from Sheih's approach are discussed. Required input data, such as land use and meteorological data base are indicated and results summarized. 17 references, 2 figures, 4 tables.

34280 **Profiles of elements in the surface boundary layer.** Doran, J.C.; Droppo, J.G. (Battelle, Pacific Northwest Labs., Richland, WA). pp 1003-1012 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A series of profile measurements of several elements has been made using x-ray fluorescence to determine concentrations on filters placed at heights of 0.75, 1.5, 3.0 and 6.0 m. For sulfur, relative accuracies of 4% or better were obtained among the concentrations on the filters for a given sampling period. This accuracy allowed deposition velocities in the range of 0.2 to 0.3 cm s^{-1} to be resolved under the experimental conditions encountered. A number of profiles were obtained that provided an upper bound of v/sub d/ in the range of 0.3 to 0.4 cm s^{-1}. No evidence was found for some of the larger values of v/sub d/ reported elsewhere. Kinked profiles were found to be associated with meteorological conditions that were not appropriate for the application of gradient transport theory to the analysis of pollutant flux. 13 references, 6 figures.

34281 **Universal model for entrainment processes.** Kyaw Tha Paw U. (Purdue Univ., West Lafayette, IN). pp 1111-1120 of Precipitation scavenging, dry deposition, and resuspension. Volume 3. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

It is shown that wind erosion, entrainment and reentrainment of particles, whether they be soil particles, spores and pollen, or inorganic particles, may be described by a single stochastic model for the occurrence of sweeping eddies. This model was developed for particle reentrainment within wind tunnel and pipe flow by Cleaver and Yates, but seems conceptually and quantitatively similar to reentrainment phenomena at the atmosphere-surface interface, assuming no saltation. Further development of this model is suggested with the inclusion of saltation processes, and with special emphasis on the physics of the atmospheric surface boundary layer and rebound-net deposition phenomena. 22 references, 1 figure.

34282 **Correction to the Gaussian source-depletion model.** Horst, T.W. (Pacific Northwest Lab., Richland, WA). pp 1205-1218 of Precipitation scavenging, dry deposition, and resuspension. Volume 3. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A correction has been proposed to the Gaussian source depletion model to account for alteration of the vertical distribution of contamination caused by deposition at the surface. The computational requirements of the corrected source depletion model are equivalent to those of the unmodified source depletion model. Considering the assumptions on which the correction is based, the proposed model is expected to predict best the near-surface airborne concentration and the suspension ratio, particularly for σ/sub z// $h > 1$. These predictions, as well as the vertical concentration profile up to a height of $z \simeq \sigma$/sub z/, were shown to compare quite well with those of an exact technique to account for deposition from a Gaussian plume. 15 references, 3 figures.

34283 Estimates of dry and wet deposition and resuspension fluxes of several trace metals in the Southern Bight of the North Sea. Dedeurwaerder, H.L.; Dehairs, F.A.; Decadt, G.G.; Baeyens, W.F. (Vrije Univ., Brussels, Belgium). pp 1219-1231 of Precipitation scavenging, dry deposition, and resuspension. Volume 3. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Air-sea exchanges in the Belgian coastal area located in the Southern Bight of the North Sea were studied. Since 1980 the tropospheric aerosol contents for the trace elements Cd, Cu, Mn, Pb, Zn and for the reference elements Al, Fe, Na have been monitored on an intermittent basis from a maritime sampling platform (Light-Vessel West-Hinder; position: 51°23.5'N-02°21.5'E). During 1981 sampling at sea was paralleled by sampling on land, in the coastal area (natural reserve De Blankaert, located at 20 km inland), in order to allow for a better evaluation of the specific source or sink role of the sea. No major source of pollution exists between the maritime and the continental sampling sites. During these simultaneous land-sea campaigns dry deposition and rainwater were sampled, besides aerosols. Furthermore, the sea surface microlayer and the watercolumn in the vicinity of the Light-Vessel were investigated for possible enrichments and in order to allow an estimation of the resuspension flux. 9 references, 2 figures, 5 tables.

34284 Influence of relative humidity and sea salt nuclei on the eddy flux determination of small particle dry deposition over the sea. Schmidt, J.; Eastman, J.; Sievering, H. (Univ. of Wisconsin, Madison; Governor's State Univ., Park Forest South, IL). pp 1233-1242 of Precipitation scavenging, dry deposition, and resuspension. Volume 3. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The transport rates of submicron particles both into and out of the sea are of particular interest to marine atmospheric scientists and extremely difficult to determine. Recently developed particle counting instruments have made possible the use of eddy correlation methods which offer what is probably the only in situ measure of these fluxes. Results of some particle eddy correlation (or eddy flux) measurements over the sea at a nearshore site are evaluated in terms of measurement problems related to the high humidity over water and the rate of small particle sea salt production. 12 references, 5 figures, 1 table.

34285 Estimation of the dry deposition velocity and scavenging ratio for organic chemicals. Tucker, W.A.; Lyman, W.J.; Preston, A.L. (Arthur D. Little, Inc., Cambridge, MA). pp 1243-1257 of Precipitation scavenging, dry deposition, and resuspension. Volume 3. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A method for estimating the deposition velocity (order-of-magnitude accuracy) and precipitation scavenging ratio for a range of organic compounds is presented. Climatological mean deposition properties used were characteristic of the atmospheric boundary layer representing conditions over the continental US. Deposition of trace organics is controlled by interfacial resistance rather than turbulent boundary layers, muting the effect of meteorological controls. 33 references, 6 tables.

34286 Size distribution and mineralogy of aluminosilicate dust particles in tropical Pacific air and rain. Buat-Menard, P.; Ezat, U.; Gaudichet, A. (Centre des Faibles Radioactivites, Gif-sur-Yvette, France; Universite de Paris XII, France). pp 1259-1269 of Precipitation scavenging, dry deposition, and resuspension. Volume 3. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Microscopic investigations of the size distribution and the mineralogy of individual aluminosilicate particles collected by bulk filtration of air and rain in the remote marine atmosphere were done. Such particles are almost completely insoluble in rainwater and provide a direct estimate of wet removal efficiencies as a function of particle size. 18 references, 2 figures, 4 tables.

34287 Snow crystal riming and arctic snowpack chemical composition. Borys, R.D. (Colorado State Univ., Fort Collins). pp 1281-1288 of Precipitation scavenging, dry deposition, and resuspension. Volume 3. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Ice core and snowpack chemical constituents in the Arctic have been used as a historical record of atmospheric chemical composition based on the assumption that there is no chemical fractionation between aerosol particles and snow crystals. Recent measurements show ice and snow chemical compositions do not reflect the overlying aerosol particle chemical composition. It is suggested that a lack of ice crystal riming in arctic snowfalls could explain the differences between snowpack and aerosol chemical constituents. Hence, ice core and snowpack chemical constituents may be poor indicators of past and present arctic aerosol chemical composition. 19 references, 3 figures.

34288 Trace gases in snow and rain. Rasmussen, R.A.; Khalil, M.A.K.; Hoyt, S.D. (Dept. of Environmental Science, Beaverton, OR). pp 1301-1314 of Precipitation scavenging, dry deposition, and resuspension. Volume 3. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Concentrations in snow and rain of 3 man-made gases (CCl_3F, CCl_4, CH_3CCl_3) and 3 gases with established oceanic sources (CH_3I, $CHCl_3$, N_2O) were studied. The snow and rain samples wer not enriched in anthropogenic gases, but were enriched in CH_3I and $CHCl_3$. The N_2O data were variable and were insufficient to establish whether rain or snow is enriched. 20 references, 4 figures, 2 tables.

34289 Global cycle of particulate elemental carbon: a theoretical assessment. Turco, R.P.; Toon, O.B.; Whitten, R.C.; Pollack, J.B.; Hamill, P. (R & D Associates, Marina del Rey, CA; NASA Ames Research Center, Moffett Field, CA; San Jose State Univ., CA). pp 1337-1351 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Scienee Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Present understanding of the global elemental carbon cycle appears to be reasonably well-founded in observational data and scientific principles. The emission rates of particulate EC are consistent with measured concentrations in the atmosphere and removal rates based on dry and wet deposition. Detailed microphysical

simulations are capable of explaining many of the observed features of the EC cycle and may be used to predict the source/sink relationships and environmental consequences of anthropogenic carbon emissions. On a global scale, elemental carbon is a trace (≦ 5%) component of the background aerosols, and plays only a minor role in the oxidation of atmospheric sulfur compounds to sulfate. On the other hand, sunlight absorption by particulate elemental carbon may produce significant heating of the atmosphere. Elemental carbon may also cause important changes in atmospheric composition, visibility and thermal stability on regional and urban scales. 63 references, 6 figures, 4 tables.

34290 **Suggestions for further research.** Georgii, H.W. pp 1417-1419 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Areas identified for future research are identified and briefly discussed. Topics presented include: heterogenous oxidation of SO_2; cloud-water studies; scavenging by ice-crystals and organic compounds in cloud and rain drops.

34291 **Comments about precipitation scavengging research.** Rodhe, H. (Univ. of Stockholm, Sweden). pp 1421-1423 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Comments are provided on the following three sessions; mountain studies, plume studies and in-cloud scavenging.

34292 **Overview and suggestions for future research on dry deposition.** Hicks, B.B.; Garland, J.A. (National Oceanic and Atmospheric Administration, Oak Ridge, TN; Atomic Energy Research Establishment, Harwell, England). pp 1429-1433 of Precipitation scavenging, dry deposition, and resuspension. Volume 2. Proceedings. Pruppacher, H.R.; Semonin, R.G.; Slinn, W.G.N. New York, NY; Elsevier Science Publishing Co., Inc. (1983). (CONF-821136—Vol.2). TI84002448

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

A brief overview of dry deposition is presented. Subjects discussed include: deposition of trace gases; deposition of particulates; culfate deposition; ozone; nitrogen dioxide and sampling techniques. Future research is also discussed.

34293 **Monitoring ambient air for mutagenicity using the higher plant Tradescantia.** Schairer, L.A.; Sautkulis, R.C.; Tempel, N.R. (Biology Dept. Brookhaven National Lab. Upton, NY). pp 123-140 of Genotoxic effects of airborne agents. Tice, R.R.; Costa, D.L.; Schaich, K.M. New York, NY; Plenum Publishing Corp. (1982). (CONF-8002106—).

From Associated Universities, Inc./Brookhaven National Laboratory Medical Department symposium on genotoxic effects of airborne agents; Upton, NY, USA (9 Feb 1980).

This chapter examines somatic mutation in the Tradescantia stamen hair. Discusses the stamen hair system; radiobiology; chemical exposures under lab conditions; chemical exposures under field conditions (ambient air); results of in situ exposures to ambient air; and the relevance of the stamen hair system to environmental mutagen assessment. Shows how the high sensitivity and versatility of the Tradescantia stamen hair system were put to good use by employing the plant as an in situ monitor for mutagens in ambient air in polluted industrial sites. Finds that the environment most consistently mutagenic was that downwind from petroleum refineries. Concludes that the most unique asset of the plant is its ability to respond to low levels of airborne compounds. Encourages the greater use of radiobiological data. Points out that the predictive potential for the effects of environmental mutagen agents is important with regard to earlier studies related to nuclear fallout and its impact on ecology (the food chain in particular).

34294 **Problems associated with assessing the mutagenicity of inhalable particulate matter.** Raabe, O.G. (Lab. for Energy-Related Health Research Univ. of California Davis, CA). pp 209-223 of Genotoxic effects of airborne agents. Tice, R.R.; Costa, D.L.; Schaich, K.M. New York, NY; Plenum Publishing Corp. (1982). (CONF-8002106—). Contract AC03-76SF00472.

From Associated Universities, Inc./Brookhaven National Laboratory Medical Department symposium on genotoxic effects of airborne agents; Upton, NY, USA (9 Feb 1980).

This chapter attempts to identify and quantify the mutagenic materials associated with airborne particles and provide information, such as mutagen median physical or aerodynamic diameter, in order to evaluate the regional deposition of the particle in the respiratory tract during inhalation by people. Discusses sample collection, particle size considerations, sample fidelity, and mutagenesis testing procedures. The goal is to predict biological fate and carcinogenic or other untoward response. Concludes that analysis methodologies should include detection limits, essential and gross features, data reduction methodologies, key constituents and overall analysis goals. Suggests that chemical identification be made of the mutagenic agents present in samples and in the sampled atmospheres.

34295 **Genetic effects of ethylene dibromide in drosophila melanogaster.** Kale, P.; Baum, J.W. (Safety and Environmental Protection Division Brookhaven National Lab. Upton, NY). pp 291-300 of Genotoxic effects of airborne agents. Tice, R.R.; Costa, D.L.; Schaich, K.M. New York, NY; Plenum Publishing Corp. (1982). (CONF-8002106—). Contract AC02-76CH00016.

From Associated Universities, Inc./Brookhaven National Laboratory Medical Department symposium on genotoxic effects of airborne agents; Upton, NY, USA (9 Feb 1980).

This chapter reports on how ethylene dibromide (EDB) can be used to show that Drosophila can detect concentrations as low as 0.2 ppm in air when exposed for a relatively short period of 11 hrs. Demonstrates the high sensitivity of Drosophila for detection of gaseous mutagens. Points out that low concentrations of gaseous mutagens in ambient air are being studied utilizing a sensitive clone of Tradescantia. Suggests that Drosophila may be extremely useful as a biological monitor to detect airborne genotoxic agents in polluted areas.

34296 **(LA-tr—84-13) Suitability of bees as an indicator for environmental problems.** Drescher, W. Translated from *Decheniana ;* **26**: 171-177(1982). Contract W-7405-ENG-36. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013351. DE84013351

Portions are illegible in microfiche products.

The hazard, especially in modern agricultural technology, for the ca. 550 Central European species of wild bees is obvious. The lack of sufficient investigations on quantitative values, however, hampers the ecological analysis and the use of these species as bioindicators. While the honey bee, Apis mellifera L., has been thoroughly investigated with respect to its toxicology, its changing population density is much obscured by human care for the colonies and therefore unsuitable for indicator functions of environmental disturbances. Systematic utilization of bee colonies as indicators of industrial emission and radionuclide distribution proved useful for the detection of effects and trends.

34297 **(DOE/EV/10374—4) Factors controlling indoor radon levels. Annual report, June 1983-May 1984.** Harley, N.H. (New York Univ., NY (USA). Dept. of Environmental Medicine). 31 May 1984. Contract AC02-80EV10374. 31p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84012712.

Portions are illegible in microfiche products.

The factors which contribute to indoor radon levels were investigated. Soil moisture content appears to be such a factor and influences indoor radon levels in a subtle way. The single family dwelling studied here is a typical suburban home, with a full basement, two living levels and a full attic. Seasonal data for 1981 to 1983 are shown by hour (about 90 hours in each average) for the basement, first floor and outdoors. A twenty-five story, 225 apartment, high rise building has been under study for about the same time interval. The apartment has five rooms, and is on the 24th floor. Continuous monitors are located in a work room and outdoors on a terrace. Data are available from the summer of 1981. 2 references, 12 figures, 9 tables.

34298 **(DOE/OR/20722—16) Weldon Spring Site environmental monitoring report, calendar year 1983.** (Bechtel National, Inc., Oak Ridge, TN (USA). Advanced Technology Div.). Jun 1984. Contract AC05-81OR20722. 45p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE84013663.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

During 1983, an environmental monitoring program was continued at the US Department of Energy (DOE) Weldon Spring Site (WSS), located in St. Charles County, Missouri. The monitoring program measures the radon gas content in air, the radium and uranium content of surface water and groundwater, and external radiation levels. The nitrate content of surface water is also measured. Radiation doses to the public from the radioactive residues stored at the site are also calculated. During 1983, site boundary radon concentrations, including radon emanating from naturally occurring sources, were alll below the DOE CG limit of 3 pCi/1. Groundwater uranium and radium-226 concentrations within the controlled site areas were all below the DOE CG limits for uncontrolled areas. During 1983, various maintenance and investigative activities at the WSS have not disturbed and stored radioactive materials. 9 references, 8 figures, 4 tables.

34299 **(DP-MS—84-38) Evaluation of Savannah River Plant emergency response models using standard and nonstandard meteorological data.** Hoel, D.D. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1984. Contract AC09-76SR00001. 14p. (CONF-840612—12). NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013146.

From Air Pollution Control Association annual meeting; San Francisco, CA, USA (25 Jun 1984).

Two computer codes have been developed for operational use in performing real time evaluations of atmospheric releases from the Savannah River Plant (SRP) in South Carolina. These codes, based on mathematical models, are part of the SRP WIND (Weather Information and Display) automated emergency response system. Accuracy of ground level concentrations from a Gaussian puff-plume model and a two-dimensional sequential puff model are being evaluated with data from a series of short range diffusion experiments using sulfur hexafluoride as a tracer. The models use meteorological data collected from 7 towers on SRP and at the 300 m WJBF-TV tower about 15 km northwest of SRP. The winds and the stability, which is based on turbulence measurements, are measured at the 60 m stack heights. These results are compared to downwind concentrations using only standard meteorological data, i.e., adjusted 10 m winds and stability determined by the Pasquill-Turner stability classification method. Scattergrams and simple statistics were used for model evaluations. Results indicate predictions within accepted limits for the puff-plume code and a bias in the sequential puff model predictions using the meteorologist-adjusted nonstandard data. 5 references, 4 figures, 2 tables.

34300 **(DPSP—61-25-7) Environmental release of iodine-131, May 29-June 23, 1961.** Reinig, W.C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). Aug 1961. Contract AC09-76SR00001. 15p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013152.

A release of 153 curies of iodine-131 from Building 291-F stack, most of which was discharged during the period of May 30 through June 3, temporarily caused high concentrations of radioiodine in milk produced in the vicinity of the Savannah River Plant. The consumption of this milk may have resulted in a thyroid dose up to 1260 mrem. The environmental concentrations of radioiodine and the off-Plant exposures resulting from the releases were below the limits established by the National Committee on Radiation Protection. Investigation of the source of the abnormally large amount of radioiodine in the F-Area canyon process was inconclusive but there is a probability that short-cooled uranium was unintentionally dissolved. 6 figures.

34301 **(DPSP—62-25-1-Del.Ver.) 1960 Audit of SRP radioactive waste.** Ashley, C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). Feb 1962. Contract AC09-76SR00001. 12p. NTIS, PC A02; 3; GPO Dep. Order Number DE84013366.

Paper copy only, copy does not permit microfiche production.

This report summarizes the radioactive waste released to the environs of the Savannah River Plant for the calendar year 1960. In addition, the total quantity of radioactive waste released from start-up of Plant operations through 1960 is summarized. Accuracy is not always implied to the degree indicated by the number of significant figures reported. Values were not rounded since data will be used in future cumulative summaries.

34302 **(DPSP—74-25-1) 1973 releases of radioactivity at the Savannah River Plant.** Ashley, C.; Zeigler, C.C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1973. Contract AC09-76SR00001. 13p. NTIS, PC A02; 3; GPO Dep. Order Number DE84013169.

Paper copy only, copy does not permit microfiche production.

This report summarizes releases of radioactive materials to the environs of the Savannah River Plant during the calendar year 1973. Total quantities of radioactivity released from plant startup through 1973 are also reported. Accuracy is not always implied to the degree indicated by the number of significant figures reported. Values were not rounded off, since data will be used in future cumulative summaries. 12 tables.

34303 **(DPSPU—84-30-1) Environmental monitoring in the vicinity of the Savannah River Plant. Annual report for 1983.** (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1983. Contract AC09-76SR00001. 233p. NTIS, PC A11/MF A01; 1; GPO Dep. Order Number DE84013817.

Portions are illegible in microfiche products.

In 1983, the impact of SRP operations on public health was insignificant. The highest radiation dose to a hypothetical adult individual on the SRP boundary from 1983 atmospheric releases of radioactive materials was 1.3 millirem (mrem). Doses to some age groups were slightly higher than the adult dose (maximum 1.9 mrem to a child.) The average radiation dose that a hypothetical adult at the SRP boundary received from atmospheric releases was 0.54 mrem during 1983. For persons living within 50 miles of SRP, the average dose was 0.15 mrem per year. The maximum radiation dose to adults downriver of SRP who consumed water from the Port Wentworth water treatment plant near Savannah, GA, was 0.22 mrem in 1983. The maximum adult dose from consuming water from the Beaufort-Jasper, SC, water treatment plant was 0.16 mrem. These radiation doses from SRP operations are small compared to the dose from natural radiation, which averages 93 mrem per year near SRP. Additionally, doses from SRP operations are small compared to the geographical differences in natural radiation. The annual natural radiation dose to Georgia and South Carolina

residents within 100 miles of SRP varies from place to place by as much as 60 mrem. The concentrations of nonradioactive materials of SRP origin in offsite air and water continued to be well within federal and state limits. 58 figures, 110 tables.

34304 **(DPST—80-351(DEL)) Radiological effect of SRP operations, 1979.** Marter, W.L. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 16 May 1980. Contract AC09-76SR00001. 14p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE84013171.

An analysis was made of the radiological effect of releases of radioactive materials to the environment from SRP operations in 1979. Release data were provided by the Health Protection Department. The more significant findings of this analysis were: atmospheric tritium releases in 1979 were 89% of those in 1978 (340,000 Ci vs 380,000 Ci). Reductions occurred primarily in Separations Areas and accounted for most of the reduction in offsite doses in 1979 (124 man-rem in 1979 vs 136 man-rem in 1978). Atmospheric releases of noble gases (excluding argon-41) from the reactors increased significantly (15,350 Ci in 1979 vs 6200 Ci in 1978) as a result of target failures. The 1979 offsite dose from these noble gases was 1.8 man-rem (vs 0.7 man-rem in 1978). Liquid tritium releases in 1979 were 73% of those in 1978 (29,000 Ci vs 40,000 Ci). Reductions occurred as a result of the first full year of operation of seepage basins in P and C Areas (basins were reactivated in mid-1978). Reduced tritium releases accounted for a reduction of about 4 man-rem to downstream consumers of river water. 11 tables.

34305 **(EGG—10282-1011) Aerial radiological survey of the Brookhaven National Laboratory and surrounding area, May 1980.** Hobaugh, J.L.; Steiner, P.A. (Brookhaven National Lab., Upton, NY (USA)). Jan 1984. Contract AC08-83NV10282. 15p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013548.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

An aerial radiological survey was performed from 15 to 18 May 1980 over approximately a 21-square-kilometer (8-square-mile) area surrounding the Brookhaven National Laboratory (BNL). BNL is located in the center of Suffolk County, Long Island, New York. All gamma radiation data were collected by flying north-south lines spaced 91 meters (300 feet) apart at an altitude of 61 meters (200 feet) above ground level. A total of 17 anomalous areas were identified. The dominant isotopes found over these areas were cesium-137, manganese-54, and cobalt-60. All anomalies identified by the aerial measurements were correlated to site activities and storage facilities. 4 references, 18 figures, 1 table.

34306 **(EGG—10282-1034) Aerial radiological survey of the Waterford Generating Station and surrounding area, Taft, Louisiana. Date of survey: March-April 1982.** Jaffe, R.J.; Feimster, E.L. (EG and G, Inc., Las Vegas, NV (USA). Remote Sensing Lab.). Feb 1984. Contract AC08-83NV10282. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE84013485.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.
